This book is a revised version of "The Theory of Electricity," by the same author, published in 1918, so that most of those readers who interest themselves in the theoretical aspect and mathematical treatment of the subject will be already aware of the general character of its contents. They will, however, be concerned to know what changes the author has found it expedient to make, in the light thrown by the developments of science during the last eight years, and by the maturing processes of his own thought. The present book is smaller than its predecessor, by the exclusion of special problems which are concerned not so much with the theory of electricity as with the application thereof, and by the omission of much that was specially addressed to aspects of the theory at that time inadequately considered and now no longer so. In its more compact form the book is all the better adapted to the needs of those who nourish the hope, and desire to be able, to think consistently about electricity—that is to say, to those who dislike having to think about electricity in terms of beliefs that mutually conflict one with another. Such persons are, of course, very far from full attainment of the object of their hope and desire, but the author does his best for them. Without adopting the electron theory of electricity as a constant underlying conception throughout the book, he frequently makes use of it and goes into many details of its development. He shows from time to time how it harmonises with the earlier conceptions of electricity and elucidates them. Thus a "point charge" in his treatment of the subject can be regarded very much as we do a "mass particle" in ordinary mechanics, and he looks to find a parallel to the processes of an electromagnetic field, in a system of masses supposed to be moving in accordance with the accepted laws of motion.

The mathematical development of the reasoning is admirably entered upon and, in every case, seems to grow out of the literary treatment, by a natural extension of language to include the symbols invented by mathematicians to economise in sentences. The theory, as it is built up, becomes a gorgeous edifice, and its top reaches to the clouds: its top is, indeed, hidden among them, as is the case with all comprehensive theories in physical subjects, since the introduction of *Relativity* and *Quanta*. The whole of the equations in which the theory is comprehended are seen to be expressible in a form that involves the four independent variables of space and time in a perfectly symmetrical manner; now that form remains precisely the same whether the equations are referred to fixed axes or moving ones, so that we can come to no conclusion as to whether we are moving relatively to the ether, or whether we are at rest, and therefore we can never know what is the correct or normal mass of any body whatever, or what are its true dimensions. And, as the author observes in his final pages: "It is quite impossible for us to attempt to examine space apart from its material content." "We may fit on to any distribution of matter, any theoretically possible kind of space, be it curved or flat; but we must not pretend it is anything more than a fiction of the imagination." He very pertinently points out that *space* is "something that can be occupied by matter," and all we can recognise in any theory are the related performances of pieces of matter, only to be described by reference to a material framework (real or imaginary).

With all these qualifications the theory of electricity still contains many lacunæ, as readers of the book will soon discover. We are, for example, entirely in the dark concerning the nature of positive electricity; the very name is no more than a confession of ignorance, as our author is obliged to admit.

If one chapter can be distinguished as more interesting than another it is perhaps the one appended, on *the mechanism of metallic conduction*. But when all is said and done we have still to think about electricity in terms of beliefs that so mutually conflict, one with another, that whatever we may doubt in regard to it, there is one thing we may be sure of, namely, that there must be something wrong about these beliefs; they cannot be all true. No one interested in the theory of electricity can afford to remain unacquainted with this treatise.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Campaign Notes, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

The E.D.A.-E.L.M.A. Campaign.

The organisers' report for the week ended February 12th states that four demonstration houses were opened during the period at Birmingham, Glasgow, Carlisle, and Bournemouth, while others at St. Albans, Peterborough, and Ipswich are in course of preparation. The Carlisle house is the eleventh to be opened in the North-East Coast Area. The Bournemouth house, which is centrally situated, was opened by the Mayor, who was supported by Dr. Hosker, of the Bournemouth and Poole Electric Supply Co., Ltd. The dwelling is officially commended as an example of what a demonstration house should be. New and additional demonstrations have been arranged at the new Birmingham house, which is situated at Erdington. Sheffield reports that about 650 people are visiting its house daily. The average attendance at the Glasgow flats was 1,555 during the first five days. Exhibitions are being held at West Hartlepool, Yarmouth, and Dumfries. During the first six days of the Hull exhibition 5,000 visitors attended, and between seven and ten thousand people inspected the Falkirk show. The North-East Coast Committee says that it intends to open many other demonstration houses during the next few weeks, and that its children's competition is proving very successful. The Carlisle demonstration house has been purchased by the Chief Constable. It is reported that in all districts builders and furnishers are eager to co-operate in the arranging of demonstration houses.

The hon. secretary of the Exeter and District Circle (Mr. A. H. Brooking) says that the demonstration house which was opened at Exeter on February 4th, comprises a hall, drawing and dining rooms, bedroom, lounge, bathroom, and kitchen, all of which are thoroughly equipped electrically. The opening ceremony was performed by the chairman of the Electricity Committee (Mr. A. Brock), the city electrical engineer (Mr. H. D. Munro), who is also chairman of the Circle, presiding. During the first five days over 7,000 people inspected the house. The Circle covers Exeter, Dawlish, Exmouth, Exton, Honiton, Lyme Regis, Topsham, and Woodbury, and electricity suppliers and contractors in all these districts are co-operating.

On the opening day nearly 1,000 people visited the second Glasgow all-electric house demonstration in Shawlands. The two houses are of the most up-to-date type of labour-saving tenement dwellings, and have been erected by the Corporation. There is only one fireplace, that in the living room, the other rooms being heated by electricity. Messrs. L. G. Hawkins & Co., Ltd., and Siemens & English Electric Lamp Co., Ltd., were responsible for most of the fittings. In the kitchenettes "Hotpoint-Falco" cookers are installed.

The Bournemouth house, which was opened on February 12th, is certainly an excellent example of its kind. The house is an old, detached residence situated near a centre of activity of the town, and is being well patronised. It is of fair size, enabling the electrical equipment to be shown to the best advantage, and it has been re-decorated throughout and furnished in attractive style. Ten rooms are thoroughly equipped, and landings, vestibule, &c., have also been attended to. The display was organised by the local Circle, consisting of the following, practically all of whom are members of the Electrical Contractors' Association:—Messrs. Aish & Co., the Bournemouth and Poole Electricity Supply Co., Ltd., Bacon & Curtis, Ltd., Dormer & Co., Edwards & Co., J. & G. Gould, S. T. Meggitt, Rogers & Kirkby, Shears & Sons, Ltd., F. Sparshott, F. H. Vivian, and A. L. Wilson. The furniture, decorations, &c., have been provided by Messrs. Bobby and Co., Ltd., Lines & Co., Shears & Sons, Ltd., and Kennedy's (Bournemouth), Ltd. The "Kaleeco" (Callender's) wiring system has been used for lighting, and the "Henley" system for power. Members of the Circle are providing demonstrators in rotation, and the instructions given to these guides deal fully with the cost and operation characteristics of all the equipment displayed. In the kitchen Messrs. Belling and Co.'s lady demonstrator gives daily exhibitions of electric cooking. Reference was made at the opening ceremony to the cost of electricity in Bournemouth, and Dr. Hosker, for the Bournemouth and Poole Electricity Supply Co., promised that when the company's position was more established substantial reductions would be made in the price of energy.

Registered Electrical Contractors.

At a meeting of the Executive Committee of the National Register of Electrical Installation Contractors, on February 11th, applications for registration made by the following were accepted:—

Bennett, A., Harpurhey, Manchester.
George, S., Rock Ferry, Birkenhead.
Wilson, E., Wolverhampton.
Hepworth & England, Batley.
Prendergast, J. F., London, W.1.
Pratt, H., Ltd., Aston, Birmingham.
Butler & Dickinson, Erdington, Birmingham.

At the same meeting one application was declined.

Committee on Industry and Trade.

The Committee of Industry and Trade, which was set up by Mr. Ramsay MacDonald in 1924, has this week issued its third report, entitled "Factors in Industrial and Commercial Efficiency." The factors in efficiency which the Committee found convenient to deal with as a whole, apart from all factors peculiar to certain trades, group themselves roughly under four headings:—(1) Factors affecting industrial structure; (2) factors affecting quality of production; (3) factors arising from the relation of the State and public authorities to industry and trade; (4) certain aspects of the questions of industrial profits, burdens, and costs. The Committee points out that one of the most important forces tending to enlarge the unit of business has been the growth of joint stock enterprise, which has greatly lessened the difficulty of financing large business by bringing in the general public as investors. The paid-up capital of joint stock companies quadrupled between 1885 and 1905, and more than doubled between 1905 and 1925. With regard to the question of scientific research, the Committee refers to the very great amount of research being carried out in other countries, and gives some account of the measures adopted by the British Government for the encouragement of research of a kind beyond the means of single firms. The results so far achieved by the research authorities formed by various industries in collaboration with the Department of Scientific and Industrial Research, while promising for the future and amply justifying the establishment of the associations, are, for the most part, rather of an educational value to the industries concerned than of a kind which can be assessed in terms of actual monetary saving and gain, though such saving and gain have undoubtedly been achieved. The Committee quotes a representative of the engineering industry who told it that "the difficulty is to finance research over the interval that elapses between incurring expenditure and producing results that the rank and file will recognise."

Export Selling.

This is the title of a paper to be read before the Institution of Rubber Industry at the Engineers' Club on Tuesday next, at 8 p.m., by Sir William Clark, Comptroller-General of the Department of Overseas Trade.

Improvements in the Radio Industry.

A good response has been received by the Radio Manufacturers' Association to the circular letter on "The Maintenance and Improvement of the Sale of British Radio Apparatus" recently issued to the trade. Classification of the replies shows that the majority consider that, amongst the many things now adversely affecting the prosperity of the British radio industry, are the nature of the B.B.C. programmes, the heavy royalty fees, and the indiscriminate granting of trade discounts. Other matters adversely commented upon include price cutting; the large number of types of valves on the market; foreign competition; standardisation, &c. The Council of the R.M.A. has referred the matters raised in these replies to committees, which will examine in detail the criticisms and suggestions put forward and will recommend to the Council what action, in their opinion, is desirable.

Our Foreign Electrical Trade.

The following were the values of imports and exports of electrical goods and machinery during January :—

	January, 1927.	Inc. or dec.
Imports—	£	£
Electrical goods and apparatus	347,956	− 5,040
Machinery	1,307,667	+284,378
(Electrical machinery) ...	130,144	+ 45,946
Exports—		
Electrical goods and apparatus	1,096,935	+207,179
Machinery	3,994,509	+145,798
(Electrical machinery) ...	613,323	+139,753
Re-exports—		
Electrical goods and apparatus	12,165	− 3,878
Machinery	104,069	− 48,885
(Electrical machinery) ...	6,589	+ 825

Business Efficiency Exhibition.

The annual Business Efficiency Exhibition was opened last week at the Central Hall, Westminster; it remains open until to-morrow (Saturday). The stands show the steady progress that is being made to eliminate unnecessary labour and wastage of time in office work, and a noticeable feature is the greater use to which electricity has been put. Machines ranging from large book-keeping machines to small dictaphones, all taking their power from the mains, are exhibited, and in addition there are several distinct developments, such as electrically-operated typewriters. Among the exhibits is the "Hollerith" electric tabulating and accounting machine, made by the British Tabulating Machine Co., Ltd. This stamps and sorts cards at the rate of 350 per minute, and tabulates them at 150 per minute. A similar type of machine is exhibited by the Accounting and Tabulating Corporation of Great Britain, Ltd. Mechanical book-keeping is one of the principal features of the exhibition, and one of the most remarkable appliances is a typewriting book-keeping machine, which is a combination of an electrically-operated automatic book-keeping machine with a standard typewriter. All tabulation, whether for description or value, is controlled by one key only. The Pitney-Bowes postage meter machine shown represents a great saving of time and labour. It is a postal franking machine which entirely obviates the use of adhesive stamps. There is also a postage-stamping machine, exhibited by Universal Postal Frankers, Ltd., which sticks ordinary postage stamps on letters, counts the number of stamps used, moistens the envelope flaps, and seals them down at the rate of 250 per minute. In the dictating machine section class, several alterations and improvements in design and construction are noted. The "Ediphone," marketed in this country by Messrs. Thomas A. Edison, Ltd., has been much improved by the addition of a new correction device and by a new electric control which enables the typist to stop, start, and in other ways control the machine without lifting her fingers from the typewriter keyboard. The "Dictaphone," manufactured by the Dictaphone Co., Ltd., is also shown. The "Mercedes Electra" electric typewriter was shown at the exhibition last year; this year it faces the competition of the "Woodstock Electrite," manufactured by the Woodstock Typewriter Co., Ltd. Several types of house or private telephone systems are exhibited, among them being the "Dictograph" control system, manufactured by Dictograph Telephones, Ltd. This is a very suitable system for large concerns, for, constructed without receivers or mouthpieces, it obviates all delay or the necessity for having a central exchange operator. Other companies exhibiting house or automatic telephones are the British Home and Office Telephone Co., Ltd., New System Private Telephones, Ltd., and the Reliance Telephone Co., Ltd. A very comprehensive display of labour-saving office equipment, most of it designed to work electrically, is shown by the Burroughs Adding Machine, Ltd.

Social Events.

On February 2nd, at the Victoria Hall, Leatherhead, a social was held by the staff of the Leatherhead and District Electricity Co., Ltd. A good gathering spent a most enjoyable evening, which included dancing, songs, competitions, &c. Mr. G. W. F. Horner, chief engineer and manager, and Mr. W. E. Owen, his assistant, were present. Messrs. H. F. Brown and H. Birch, of the mains department, were the organisers.

The Wiring Supplies Department of the British Thomson-Houston Co., Ltd., recently held a very successful social evening at the Union Helvetia Club, W.1. Over 150 members of the staff were present, including many from other departments, and a number of visitors. The evening opened with an informal dinner, presided over by Mr. R. A. Lower, acting manager of the department. After dinner there was a dance and song programme arranged by Mr. Harris. Nearly all the singers were members of the staff.

Calendar.

Messrs. ANDERSON, BOYES & CO., LTD., Motherwell, have sent us a calendar of the "perpetual" type. The centre-piece is a cardboard model of a chain-type coal cutter, the head of which rotates over a circular scale numbered from 1 to 31. In openings at the sides appear the day and the month.

New Lamps for Old.

The suggestion is made by Councillor A. Stott, of the Bradford City Council, that the Electricity Department should replace lamps free of charge for all domestic consumers of electricity. This, he urges, would prove remunerative to the Corporation, inasmuch as at present considerable revenue is lost from many of the poorer consumers, hundreds of whom never buy a new lamp until they are absolutely compelled to. The proposal reminds us of the far-off days when Mr. A. H. Gibbings, as borough electrical engineer of the same city, brought forward his proposals for free lamps for consumers. It is also proposed that the Corporation should undertake the wiring of houses upon a deferred-payment plan.

Indian Tariff Revisions.

The *Board of Trade Journal*, dated February 10th, contained a schedule of revisions in the British Indian import tariff. Among the items noted are the following :—Electrical control and transmission gear for circuits rated at less than 10 A and 250 V; bare or insulated copper wires with conductors less than $\frac{1}{8}$ sq. in. in area, and other cables with equivalent dimensions; certain wiring materials for other than industrial use; all of which are subject to a duty of 15 per cent. *ad valorem*. Certain classes of machinery, including prime movers, boilers, and power-driven machines, as well as copper and other cables, and wires, poles, troughs and other transmission apparatus, are subject to a duty of $2\frac{1}{2}$ per cent. *ad valorem*. Telegraphic instruments and apparatus imported by a railway company are admitted free of duty.

Belgian Duty on Electric Irons.

The "coefficient of increase" applicable to the duty upon electric irons (weighing less than 10 kg. each) upon importation into Belgium has been raised from 4 to 5.2 per cent.

Commercial Electrical Travellers.

The second annual dinner of the Electrical Trades Commercial Travellers' Association was held at the Holborn Restaurant on Friday, February 11th. Mr. Arthur S. Markes occupied the chair. The fraternal spirit predominated, and there were speeches enough to appease those afflicted with the most insatiable thirst for after-dinner oratory, notwithstanding the forethought which placed the words "Brevity is the soul of wit" prominently on the printed list of toasts. Sir Hugo Hirst, Bart., responded, as president, to the toast of "The President and Vice-President," Mr. A. E. Iliffe and Brig.-Gen. P. S. Boucecault replying on behalf of the vice-presidents. Sir Hugo was reminiscent and story-telling. He began by remarking that he started in the same rank as was held by them now. Engineers had great problems, and we admired their skill, but they did not know what knowledge, diplomacy, tact, skill, judgment, and other equipment was necessary in getting rid of their goods. He recalled the interesting, but to-day peculiar, conditions which obtained when he once called himself a commercial traveller—when there were no central stations, when he had to go round and make friends and study their wants, when he (40 years ago) prepared a catalogue of electrical goods, when simple electrical diagrams had to be included in such publications. Nowadays everybody was more or less an amateur electrical engineer, and the commercial electrical traveller must have a knowledge of technicalities so as to improve his efficiency in salesmanship. Mr. Iliffe also touched upon the importance of their aiming at a high standard of trained commercial electrical traveller. Referring to the Association, he mentioned the advantages of associated working as a means to producing good trained men. The industry should support the Association so that travellers should be up to standard and should be afforded opportunities to progress to the full extent of their knowledge. The new Electricity Act would call for a higher quality of salesmanship than we had hitherto had. Brain power had to be diverted from the generation of electricity to the selling of goods. An interesting item not on the official programme was a presentation to Mr. E. A. Joyce, the late chairman of the Association, in recognition of the excellent and self-sacrificing work that he had put into the organisation as chairman during the first 18 months of its existence.

Fire.

The Times reports that damage amounting to about £300 was done by a fire which broke out on February 12th at the works of Messrs. Johnson & Phillips, Ltd., Charlton. The fire was confined to a one-floor brick building used for storing jute, about two-thirds of which was destroyed.

Industrial Welfare.

The increasing confidence in a revival of trade has resulted in a considerable growth in the number of inquiries which the Industrial Welfare Society receives on matters relating to staff welfare and the management of *personnel*. By pooling the experience of its 700 member firms this organisation is able to give trustworthy advice on the many activities associated with industrial welfare work, and is thus able to fulfil the important function of a clearing house for information of this kind. In order that the service may be kept up-to-date it is very desirable that as many firms as possible should co-operate. Employers who are willing to give others the benefit of their experience are invited to communicate with the Society at 51, Palace Street, S.W.1.

Unemployment.

There was a further decrease (17,220) in the number of unemployed during the week ended January 31st. The total at that date was 1,331,500, as compared with 1,348,720 on January 24th, and 1,174,978 on February 1st, 1926.

Trade Announcements.

With reference to our review of Wade's Tables (Overhead Electrical Transmission Lines), Electrical Review, February 4th, 1927, Mr. Christopher Wade, A.M.I.E.E., asks us to state that he is the sole representative for the Hull branch of Gabriel Wade & English, Ltd., for telegraph, telephone, and overhead poles and accessories. His address is: 46a, Ashburnham Road, Bedford.

The change of name of Vickers-Petters, Ltd., to Petters (Ipswich), Ltd., has now been officially sanctioned, and the new name is being used forthwith.

A new company, Gwynnes Pumps, Ltd., has been formed to take over the centrifugal-pump and other machinery manufacturing business of Gwynnes Engineering Co., Ltd. By an arrangement with Messrs. William Forster & Co., Ltd., the manufacturing side will ultimately be transferred to their Lincoln works. In the meantime the company is carrying on at the Hammersmith Iron Works.

The Oxford Wireless Telephony Co., Ltd., 11, New Road, Oxford, is removing the manufacturing side and battery service of the business to new premises in Titmouse Lane.

New Catalogues and Lists.

The Marconiphone Co., Ltd., 210-212, Tottenham Court Road, W.1.—An illustrated and priced pamphlet describing the "K.L.1" valve, together with a book of instructions for building a receiver incorporating three of these valves and a coloured poster advertising the "K.L.1." Applicants for the instruction book are asked to remit 6d. in stamps.

Electric Fires, Ltd., Heatrae Works, Norwich.—Catalogue sheet, describing, illustrating, and pricing a new electric paraffin wax bath for vulcanising.

The Great Northern Telegraph Co., Ltd. (of Denmark), 5, St. Helens Place, E.C.3.—A price list for use with a catalogue of telephone and other apparatus which was issued by the company last year.

Messrs. Cecil Hodges & Co., Ltd., Empire Works, Dalston.—Folders 109/2 and 132, illustrating and describing "Empirelight" small lighting sets. Priced.

The Jackson Electric Stove Co., Ltd., 143, Sloane Street, S.W.1.—February calendar-blotter, advertising "Jackson" electric cookers for hiring schemes.

International Time Recording Co., Ltd., 112, Strand, W.C.2.—Pamphlets advertising the company's time-recording apparatus.

The Jeary Electrical Co., Ltd., 26-28, Lamb's Passage, Chiswell Street, E.C.1.—A net trade price list of electrical accessories, including cables, wires, switch- and fuse-gear, bells, &c.

Graham Amplion, Ltd., 25-26, Savile Row, Regent Street, W.1.—Three illustrated pamphlets, describing the "Amplion" public speech and band repeater equipment, and referring to public occasions upon which it has been used.

Messrs. James McMillan & Co., 17, Surrey Street, Strand, W.C.2.—An illustrated catalogue of "Rex" heating, cooking, and other domestic apparatus.

The Quasi-Arc Co., Ltd., 15, Grosvenor Gardens, S.W.1.—Two illustrated pamphlets, describing work carried out by the company's welding process—a gasholder and engine seatings in motor vessels.

Orion Lamps, Ltd., 15-17, Eldon Street, E.C.2.—A folder giving prices of vacuum and gasfilled lamps.

The Weinbau Electrical Co., 327-329, Commercial Road, E.1.—A trade price list of electrical materials and accessories.

Messrs. S. G. Brown, Ltd., North Acton, W.3.—The "Brown Budget" for February, containing illustrated notes upon the company's activities.

Messrs. E. Brook, Ltd., Empress Works, Huddersfield.—Catalogue No. 149, dealing with the construction of the company's motors. Illustrated.

Siemens & English Electric Lamp Co., Ltd., 38-39, Upper Thames Street, E.C.4.—February price list of electrical appliances and accessories. Illustrated.

The British Vacuum Cleaner & Engineering Co., Ltd., Parsons Green, S.W.6.—Illustrated pamphlets dealing with the "Goblin," "Turbinet," and "Brivac" vacuum cleaners.

Electricity Services, Ltd., 27, Martin Lane, Cannon Street, E.C.4.—A card advertising the company's installation business, &c.

The British Thomson-Houston Co., Ltd., Crown House, Aldwych, W.C.2.—A coloured cardboard cut-out 18 in. high and 11 in. wide, advertising "Mazda Pearl" lamps.

The Swedish General Electric, Ltd., 5, Chancery Lane, W.C.2.—List No. A 30, containing illustrations, details and prices of single- and polyphase motors.

The National Gas Engine Co., Ltd., Ashton-under-Lyne.—Catalogue No. 2516, containing fully-illustrated details of "National" self-starting heavy-oil engines.

Pneumatic Conveyance & Extraction, Ltd., Moor Street, Wilmslow Road, Manchester.—A brochure describing the company's "Pneuconex" system of conveying, extracting and cleansing for boiler installations, &c. Fully illustrated.

Bankruptcy Proceedings.

A. W. Pegrum (trading as Economia), electrical contractor, 258, High Holborn, W.C.—An order of discharge subject to a suspension of 12 months was granted to this bankrupt on February 9th at the London Bankruptcy Court. The Official Receiver reported that the applicant failed in August, 1926, with provable claims of £4,434 and assets of £11. In March, 1923, he formed a limited company to manufacture and sell a patent electric grill, but the venture was not a success. The failure was further attributed to bad trade and heavy overhead charges.

H. A. Mills, 1, Lorne Villas, Old Windsor, Berks., electrical engineer, tobacconist, &c.—The public examination of this debtor was held recently at Windsor. The statement of affairs showed liabilities of £452 against assets of £177, leaving a deficiency of £275. Debtor attributed his position to labour troubles and the ill-health of his wife. The examination was adjourned to be closed.

Albion Electric Co., 112, Albion Street, New Brighton, Chester.—Receiving order made February 2nd on a creditor's petition.

G. R. Sim, motor and electrical engineer, Hartlepool Street, Thornley, Durham.—First meeting held February 17th at the Official Receiver's office, 14, John Street, Sunderland. Public examination March 1st at the County Court, Durham.

R. H. Atkinson, electrical engineer, 33, Prince's Avenue, Old Trafford, Manchester.—Bankrupt discharged January 11th, 1927.

J. O. Joyce, electrician, 7, Parade, Leamington.—Trustee, Mr. C. J. Band, Official Receiver, 9-11, High Street, Coventry, released January 31st.

E. Cowley (trading in co-partnership with G. Hill and G. Noble, as G. Hill & Co.), electrical engineer, 22, Chantry Lane, Great Grimsby.—Application for discharge to be heard March 17th, at the Town Hall, Great Grimsby.

G. C. Barnes, electrical engineer, 3, Swift Street, and Regent Electrical Works, Barnsley.—Last day for proofs for dividend, February 26th. Trustee, Mr. B. S. Briggs, Official Receiver, 21, King Street, Wakefield.

J. V. Figgins, plumber, sanitary and electrical engineer, 97, Fore Street, St. Marychurch, Torquay.—Last day for proofs for dividend, February 26th. Trustee, Mr. W. R. Cocks, Official Receiver, Exeter Bank Chambers, 67, High Street, Exeter.

C. E. F. Parker, electrical engineer, Greendale, Privett Road, Gosport.—Adjudication order annulled and receiving order rescinded on February 3rd, debts having been paid in full with 4 per cent. interest.

Company Liquidations.

Wareham Electric Supply Co., Ltd.—A petition for the winding up of this company has been presented to the High Court by Mr. W. E. Weston, of 54, Spring Grove Road, Hounslow, a shareholder, and will be heard in London on February 22nd.

Fladbury Electric Light & Power Co., Ltd.—Winding up voluntarily. Liquidator, Mr. W. G. Day. Meeting of creditors, February 19th, at 51, Foregate Street, Worcester.

Claremont, Johnson & Co., Ltd.—Meeting of creditors, February 28th, at Winchester House, Old Broad Street, E.C. Particulars of claims by February 19th, to Messrs. W. Wilson and J. H. Walter, joint liquidators, 26 and 27, Union Bank Buildings, Holborn Circus, E.C.

Dissolution of Partnership.

E. Parkin & Son, plumbers, electric lighting and sanitary engineers, 35, Malpas Road, Newport, Mon.—Messrs. E. and R. H. Parkin have dissolved partnership. Mr. R. H. Parkin will attend to debts and continue the business under the old style.

Reduction of Capital.

Contraflo Engineering Co., Ltd., and Reduced.—A petition has been presented to the High Court for the confirmation of the reduction of the capital of the company from £80,000 to £43,725, and will be heard in London on February 22nd.

Prices of Materials.

Messrs. F. Smith & Co. report, February 15th:—Copper (electrolytic) bars, £61 10s., 20s. increase; do., do., sheets, no change; do., do., wire rods, no change; do., do., h.c. wire, 9⅛d., ⅛d. increase.

Messrs. James & Shakespeare report, February 15th:—Copper bars (best selected) sheet and rod, £86, £2 decrease; English pig lead, £29 10s., 30s. increase.

Messrs. Edward Till & Co. report, February 15th:—No change in the price of india-rubber, Para fine.

Reporting on the lead market on February 12th, Messrs. James Forster & Co. recorded an advance on the week of 23s. 9d. a ton. "An appreciation in values of 12s. 6d. in one day scared those consumers who had not covered their requirements, and considerable buying then took place in this country and in Germany, and also in the United States, which sent up prices a further 11s. 3d. a ton. . . . Lead is gradually getting on to a sounder basis, stocks are not unduly heavy, and demand from consumers in this country is broadening. . . . The prospect is for firmer markets with a rising tendency."

G.E.C. Exhibitions.

Messrs. A. E. Dunkley, Margate, in conjunction with the General Electric Co., Ltd., exhibited a complete range of "Magnet" household electrical appliances at the Pavilion and Winter Gardens, Margate, from February 5th to 12th. The General Electric Co., Ltd., is conducting a series of demonstrations in the showrooms of Messrs. John Barker and Co., Ltd., Kensington, W., with a number of "Magnet" household electrical appliances. Two demonstrators are engaged throughout a period of probably three weeks (the opening day was February 7th) in assembling and breaking down for re-assembly such varied appliances as irons, kettles, hair dryers, and boiling plates, giving ocular proof of the ease and simplicity with which readjustments and replacement of elements can be effected. A complete range of the "Magnet" household electrical appliances is exhibited adjacent to this demonstration stand.

Floodlighting for Nightwork.

We are informed by the British-Thomson-Houston Co., Ltd., that the address of Messrs. Bell Bros., who are the electrical contractors for the work mentioned in our last issue under the above title, is 7, Camomile Street, E.C.3., and not Cannon Street as originally stated.

Belgian Activity in Poland.

Under the auspices of the Société d'Entreprises Electrique en Pologne, a Belgian undertaking, new companies have lately been formed to exploit electric power concessions in the towns of Czenstockowa, Kielce and Piotrkow, Poland.

Recent Contracts.

The Metropolitan-Vickers Electrical Co., Ltd., has been awarded a contract for the electrification of part of the Higher Walton Mills of Messrs. G. & R. Dewhurst, Ltd. Group drive has been adopted and eight motors ranging from 350 h.p. to 10 h.p., and totalling 820 h.p., are to be installed to replace beam engines driving machinery in two weaving sheds with 1,600 looms, a mule spinning room with about 11,000 spindles, a size-mixing room, warehouse, and workshops. The larger motors are to be of the slip-ring type, and the smaller motors of the squirrel-cage type. Suitable control gear and a 5-panel switchboard are included in the order.

Messrs. E. Bennis & Co., Ltd., have now received a contract for the complete equipment of mechanical chain grate stokers for Stirling boilers, and mechanical coal-handling plant for the new generating station of the City of Coventry. This comprises:—16 Bennis chain grate stokers (induced draught type), two barge-unloading telphers, hopper weighing machine, U-link chain conveyors, jib crane and track, rotary truck tipper, and weighbridge and accessories.

Since the beginning of February the Electric Furnace Co., Ltd., 17, Victoria Street, S.W.1, has received orders from British firms for 15 75-kVA Ajax-Wyatt electric induction furnaces for melting brass. These furnaces will be capable of melting an aggregate of about 50,000,000 lb. of brass per annum.

A Gas Company and the Electricity Act.

At the recent annual meeting of the Gas Light & Coke Co., Mr. D. Milne Watson (chairman) said that it remained to be seen what the effect of the new Electricity (Supply) Act would be on the electrical industry. In any case, he felt quite confident that, if gas undertakings would only do their duty by the public and see that the supply of gas was always satisfactory, there was little to fear from the shareholders' point of view as to the future. The gas industry did not oppose the Bill in principle, but exerted itself to obtain certain amendments, which had been embodied in the Bill, so that the Electricity Act, from their point of view, was a much fairer measure than it was when it was introduced into the House of Commons.

United States Electrical Exports.

The total value of the electrical goods exported from the United States during November, 1926, was $9,072,042, as compared with $8,035,710 in November, 1925. There were a number of very large increases, the outstanding one being a rise in the value of exported steam turbo-generator sets from $9,397 to $352,191. Primary batteries rose from $177,562 to $364,417; storage batteries from $181,002 to $301,132; mining and industrial locomotives from $19,955 to $144,906; motor-driven household devices from $90,060 to $135,617; domestic heating and cooking devices from $109,879 to $231,504; and power transformers from $67,534 to $338,873. The decreases were fewer in number and of less importance; the classes affected were transmission and distribution apparatus, electrical porcelain, furnace electrodes, railway locomotives, insulated iron and steel wire, and insulated copper wire and cable.

The exports for the first eleven months of 1926 totalled $89,178,896, as compared with $77,753,987 for the corresponding period of 1925.

Manchester Retailers and Municipal Selling Powers.

In the report presented at last week's annual meeting of the Manchester Retail Traders' Association, a strong protest was made against the powers to sell electrical apparatus recently granted to the City Electricity Department. A letter has been addressed to the City Council upon the subject.

Railway Concession for Exhibitors.

It has been the practice of the railway companies to charge half rates upon exhibits returned from agricultural shows. In response to representations by the Association of Chambers of Commerce, the companies have now agreed to extend this concession to exhibitors at the Shipping and Engineering Exhibition, the Olympia motor vehicle shows, and other exhibitions.

New Burmese Companies.

Several new companies have recently been formed in connection with electricity supply in Burma. Among them are the Tawateintha Pagoda Electric Light Association, organised at Tawateintha Pagoda, Myaungmya, with a capital of 50,000 rupees; the Toungoo Electric Supply Co., No. 1 Street, Toungoo, capital, 100,000 rupees; and the Magme Electric Supply Co. (1926), Ltd., Natmank Road, Magme Town, capital, 50,000 rupees.

Beckenham and Electrical Contractors.

The Beckenham Electricity Committee recommends the following arrangements with local contractors:—The contractors are to give the Council the names of all their clients taking electricity for any purpose and to assist in every way in developing the domestic and cooking loads. In the case of clients thus introduced by the contractor the Council is to provide the contractor with fittings, accessories and stores at the usual trade terms, plus 10 per cent., and a guarantee that all immediate business resulting from a visit to the showrooms by his client, or a call by one of the Council's representatives for the purpose of securing business, shall benefit the contractor to the full amount of the bill chargeable, less a share amounting to 10 per cent. on cost, which the Council is to receive. In consideration of a cooker being hired out by the Council as an immediate result of such an introduction, the work of wiring for the cooker shall be carried out by the contractor making the introduction, at agreed schedule rates. These arrangements are to apply only when the first contact with the consumer is through the contractor.

Foreign Electrical Loans in America.

Commerce Reports, in an article on foreign loans floated in the United States during the last quarter of 1926 shows that among these were the following loans of an electrical nature: Unterelbe Power & Light Co., $2,500,000; Berlin Electric Elevated & Underground Railway Co., $12,000,000; Berlin Electric Co., $15,000,000; and the Montreal Light, Heat and Power Co., $9,000,000.

Strike at Bermondsey.

On February 10th, about 40 men employed by the Bermondsey Borough Electricity Department ceased work as a protest against the employment of a man stated to be a non-trade unionist. The strike affected only casual employés engaged on outside work; the power station men are not involved.

It was explained to the Press on behalf of the Council that a rule exists that men engaged must be trade unionists or undertake to join a union within a week of engagement. The man who was the cause of the dispute had given such an undertaking, but in spite of this a strike was called, the Electrical Trades Union stating that the man was not eligible for membership.

Yorkshire Lead Mines Reopened.

The Times reports that lead mines at Greenhow, near Harrogate, have been reopened after being closed for 60 years. Some of the old steam-winding equipment has been recovered and put into use again. At various depths workings through rich lead veins are known to radiate in all directions from the shaft.

New Municipal Showrooms.

The Paisley Corporation Electricity Department has opened showrooms at 4, Abercorn Street, Paisley, and is showing a special range of domestic electrical appliances.

Book Notices.

"Rotary Convertors, their Principles, Construction, and Operation," by E. P. Hill. Pp. xiii+329; figs. 247. London: Chapman & Hall, Ltd. Price 25s. net.

"Surface Water Supply of Canada: St. Lawrence and Southern Hudson Bay Drainage (Eastern Section), Quebec. Climatic Years 1923-24 and 1924-25." 168 pp. and map. Ottawa: F. A. Acland, Government Printer.

"The Practical Telephone Handbook," by J. Poole. Seventh edition. Pp. xxv+870; figs. 687. London: Sir Isaac Pitman & Sons, Ltd. Price 18s. net.

"Home Fires Without Smoke." Edited by Cyril Elliott, B.Sc., and Marion Fitzgerald. Pp. 58+xvi. London: Ernest Benn, Ltd. Price 3s. 6d. net.—A number of contributions to this work amount to a general attack on the old coal-fired kitchener and open-type coal grate. A chapter on "Electricity and Smoke Prevention," by Major F. H. Masters, O.B.E., M.I.E.E., with an introduction by Miss C. Haslett, in non-technical language, puts the case well for the different electrical appliances required for various household services, and at the same time stresses the advantage of the combined use of electricity for all purposes.

For Sale.

By direction of Messrs. Alfred Herbert, Ltd., Messrs. Edwards, Son & Bigwood will sell by auction at Blic Works, Cheston Road, Aston, Birmingham, on March 8th and following days the remaining plant of the British Lighting and Ignition Co., Ltd., together with other machinery, including machine tools, lathes, drilling machines, power presses, electric motors, &c. Sutton Coldfield Electricity Department has for disposal surplus generating plant, now installed at the Riland Road Electricity Works. Rochdale Board of Guardians invites offers for surplus generating plant and scrap metal. By order of the joint receivers and liquidators of Eastwood, Swingler & Co., Ltd., engineers, &c., of Osmaston Road, Derby, Messrs. Richardson & Linnell will sell by auction on March 8th, at St. James' Sale Rooms, Derby, the freehold property, plant and machinery, &c. Mr. H. J. Shaw will sell by auction on February 23rd, at 13, High Holborn, wireless and electrical stocks. (See our advertisement pages to-day.)

Local Exhibition.

An electrical exhibition will be held in the Town Hall, Marlborough, on March 3rd, and manufacturers and others desirous of taking part in the exhibition are invited to communicate with the Council's engineers, Messrs. A. Hugh Seabrook & Partners, 146, Bishopsgate, E.C.2.

Wages in the Engineering Industry.

The February *Journal* of the Amalgamated Engineering Union deals with the brighter prospects of the engineering industry. It is noted that during the November-December period the Union's unemployment figure fell by 3,673, and all indications show a further decline. "It is with these factors in mind that we venture to suggest the time has arrived when the question of an increase of wages to those engaged in our industry should be revived. We have, on occasions, referred to the fact that sections of the industry have been for a considerable time past in a position to well afford an increase of wages to their workpeople, and now that the industry in general is showing a decided tendency towards improvement, we claim that this question should receive attention."

The *Daily Herald* reports that the London Joint Engineering Council has decided to recommend the district committees of the 18 unions concerned to make application for an advance of 3d. per hour (roughly, 12s. per week).

Lighting and Power Notes.

Australia.—Victoria.—According to the *Australasian Electrical Times*, under a Bill presented to the State Parliament in December additional capital expenditure on the State electricity schemes, totalling £1,593,331, was authorised. Among the principal items were: Sugarloaf-Rubicon scheme, £350,000; country and extra-metropolitan supply, £250,000; supplies to centres not served by present or proposed transmission lines, £40,000; extending metropolitan h.p. system, £130,000; additional generating plant, £10,000; Yallourn power station, £150,000; open cut workings, £270,000; extending briquetting works, £50,000; Yallourn township, £106,000; service buildings, equipment and minor works, £90,000; working capital for overburden removal, open cuts, £60,000; accommodation, roads, streets, and electric light at old open cut settlement, £10,000; interest and other expenditure, £70,000. On conversion of certain metropolitan areas to 3-phase supply, &c., £325,000 will be expended.

Barnsley.—Mains Extensions.—The Electricity Committee is to carry out extensions to mains at a cost of £3,000.

Barnstaple.—Loan.—The Town Council has applied for sanction to a loan of £1,800 in connection with the relaying of the feeder cable in High Street.

Overhead Lines.—The Ministry of Transport has consented to the use of overhead lines for supplying electricity outside the borough.

Barrow.—Electricity Extensions.—The borough electrical engineer has submitted a report to the General Purposes Committee on an interview with the Electricity Commissioners on January 26th, with regard to the proposed extension of the plant at the Buccleuch Street works, at an estimated cost of £60,000, when the deputation was informed that if it could be shown that by carrying out the proposed extension the supply would be obtained at a lower price than that offered by Messrs. Vickers, the Commissioners would be prepared to sanction the extension. It was resolved that the report be approved, and that the Council be recommended to make application for sanction to the borrowing of £60,000 for extensions at the electricity works, made up as follows:—One 6,000-kW turbo-alternator, switchgear, pipework, and auxiliary plant, £30,000; boiler and auxiliary plant, £16,750; coal-handling plant and bunkers, £3,000; cooling tower and foundations, £2,000; pipework, £2,500; engine room cranes, £750; contingencies, £5,000. The Town Council has approved the Committee's proposal.

Supply to Cark and District.—The Council has also agreed to the proposal of the Electricity Committee to supply electricity to the Cark and District Electricity Co., Ltd., the latter to take the supply from the Corporation's main transmission line between Ulverston and Grange, where a pole transformer will be erected, and to construct a line from this point to its own generating station. The company is prepared to take not less than 25,000 kWh per annum for a period of five years.

Bristol.—Inquiry.—An inquiry was held by Col. T. C. Ekin, for the Electricity Commissioners, on February 8th and 9th into applications for Special Orders by Bristol Corporation to supply electricity in parts of the rural districts of Chipping Sodbury, Thornbury, Walmley and Keynsham, and by the Warmley Rural District Council in respect of its area. For the Corporation it was stated a supply could best be given from Bristol, where over £2,000,000 had been invested in the undertaking, and over 600 miles of cables had been laid. Owing to shortage of plant it was not possible at present to give a bulk supply to the Warmley rural area. Sir Seymour Williams, for the Warmley Council, stated that the Corporation's scheme was not *bona fide*, but designed to stake out an area and prevent any other authority from supplying in it, and that if the Corporation was prepared to lay mains as shown by the Warmley Council, the latter authority might come to terms. Objections were also made by other local authorities. At the suggestion of Col. Ekin, the contending parties decided to confer with a view to further considering the matter, and the inquiry was closed.

Bridge of Allan.—Transfer of Order.—The Town Council has signed an agreement for the transfer of the Bridge of Allan Electricity Supply Order, 1925, to the Scottish General Electric Power Company.

Brownhills.—Electricity Agreement.—The Urban District Council has decided to enter into an agreement with the Cannock Chase Colliery Co. to provide electricity for lighting the houses at Norton Canes.

Bugle (Cornwall).—Electricity Scheme.—Mr. Stamp, manager of the St. Austell and District Electric Lighting and Power Co., Ltd., attended a public meeting on February 7th called to consider the question of electric lighting, a previous meeting of the residents having voted in favour of the scheme. Mr. Stamp stated that the cost of conveying electricity to and through the Bugle area would be £4,500, and the minimum charges to consumers would be 10s. 10d. per quarter during the summer months and 15s. during the winter months. The meeting decided to ask the Parish Council to issue pamphlets to householders giving details of the proposal, and it was also decided to canvass the area to ascertain if the neighbouring villages of Stenalees and Penwithick would join the scheme.

Canvey Island.—Electricity Supply.—The Urban District Council recently sent a deputation to the Southend-on-Sea Corporation Electricity Committee in connection with the proposed erection of a generating station on the island. The deputation intimated that if Southend would apply for power to erect the station and give a bulk supply on reasonable terms, the Urban District Council would accept the supply and apply for an Order to become distributor in its own area. The Council has approached the County of London Electric Supply Co., Ltd., and the East Anglian Electricity Co., with a view to securing a clause in their Bills agreeing not to oppose the application by any local authority for a Special Order to distribute electricity within the urban area.

Carlisle.—Inquiry Result.—As the result of a recent inquiry the Town Council has received the consent of the Ministry of Transport to the use of overhead lines over certain property for the supply of electricity.

Mains Extensions.—The Council is to carry out mains extensions at a cost of £2,230.

Caterham.—Hospital Supply.—The Metropolitan Asylums Board has adopted revised plans for improving the lighting arrangements at Caterham Mental Hospital, provision now being made for wiring for electricity, electric motors for the laundry, and automatic telephones, at a cost of £10,550, and the erection of a sub-station at a cost of £500.

Continental.—Sweden.—A new hydro-electric power station has recently been completed at Norrforsen on the River Ume. It has a capacity of 37,000 h.p., with facilities for further extensions. The energy generated is supplied to the town of Umea and several sawmills and pulp mills in the vicinity.

Russia.—The Soviet Government has recently drawn up a five years' scheme of new electric power station construction in Northern Caucasia. The scheme provides for the construction of five large stations with a total capacity of 420,000 kW, two stations totalling 11,000 kW, and a series of small country stations aggregating 12,000 kW. The first of the five large stations will be erected at Shachty, and is intended for the supply of power to Rostov, Schachty, Konstantinowskaja, Nowotscherkask and Sulim. A second will be a hydro-electric plant at Mineralaye Wody to supply the pleasure resorts in the district, and also power for the railway connections to the harbours. The third station will be erected on the river Bjelaja, and will supply electricity to the naphtha industry in the Krasnodar district. The fourth plant will be at Noworossisk, and will supply electricity to the local cement works, while the fifth will be at Grosny.

BELGIUM.—The Société d'Electricité de la Campine is engaged on the construction of a new central station at Moll, near the canal connecting the Rivers Meuse and Scheldt. The plant, which, in the first instance will comprise two steam turbo-generators each of 10,000 kW, will be connected by a 50,000-V overhead transmission line to the distribution system of the Société de l'Electricité de l'Escaut, of Antwerp, and by 26,000-V underground lines to the Beeringen and Helchteren-Zolder collieries.

Dewsbury.—ELECTRICITY IN BULK.—The Corporation Electricity Committee has entered into agreement with the Yorkshire Electric Power Co., for a supply of electricity in bulk for 15 years. Sub-stations are to be erected near the Thornhill Council offices and at the Thornhill housing estate, subject to an initial payment by the Corporation of £700, in order to supply electricity to the Thornhill area.

LOANS.—The Town Council has applied for sanction to loans of £650 for the erection of three sub-stations, and £2,850 for laying mains and services to Thornhill.

East Anglia.—OPPOSITION TO BILL.—The Corporations of Ipswich, Beccles, and Lowestoft have decided to oppose the Bill promoted by the East Anglian Electricity Supply Co., Ltd., relative to the supply of electricity in Essex, Norfolk and Suffolk.

East Ham.—RENTAL SCHEME.—The electrical engineer has suggested the institution of a rental scheme, the consumer to be charged a fixed quarterly sum plus 0.9d. per kWh for all electricity consumed, and the Electricity Committee has recommended the wiring of approximately 200 houses under this scheme.

WATER HEATERS.—The committee has also recommended the purchase of 100 electric geysers for loan to consumers under the domestic tariff system, providing the consumers pay the cost of installation.

PRICE REDUCTION.—It is proposed to remove the increase of 10 per cent. made on the electricity charges which was imposed as a result of the coal dispute.

Folkestone.—ELECTRICITY SUPPLY.—The Town Council has arranged with the Folkestone Electric Supply Co., Ltd., for a supply of electricity to the new Leas Cliff Hall, the company guaranteeing that for the first year the cost of electricity shall not exceed £1,388. For display lighting additional electricity will be supplied at 2d. per kWh.

Gainsborough.—ELECTRICITY SUPPLY.—The Council's consulting engineers, Messrs. A. Hugh Seabrook & Partners, report that the electricity undertaking should be ready to commence supply by about the end of March.

Gillingham (Kent).—LOAN.—The Town Council has applied for sanction to a loan of £10,000 for mains and services.

OVERHEAD LINES.—Application has also been made for approval to use overhead cables for converting some of the street lamps in the borough from gas to electric lighting.

Halifax-Huddersfield.—LINKING-UP COMPLETED.—The linking-up between the electricity undertakings of the Halifax and Huddersfield Corporations has been completed at a cost of £85,000, and tests have proved satisfactory. The connection will prevent such stoppages of supply as have occurred several times recently at Huddersfield. The scheme has been carried out on the recommendation of the Electricity Commissioners, as an alternative to extensions of the power station at Huddersfield.

Hazelgrove and Bramhall.—LOAN.—The Urban District Council has applied for sanction to the borrowing of £35,000 for extensions and for l.p. mains for the next three years.

Ipswich.—NEW PLANT.—According to the *East Anglian Daily Times*, at a meeting of the Corporation on February 9th, the Electric Supply and Transport Committee reported that the maximum load on the station during the winter had increased to such a level that it was necessary to consider the question of installing another turbo-alternator, and it recommended the substitution of a 1,000-kW, d.c. Willans turbine set by a 5,000-kW Brush-Ljungström turbo-alternator, which would bring the equipment to two 5,000-kW and two 3,000-kW sets. This, with the necessary boiler plant, would entail an expenditure of £60,700. To keep pace with the demands, it would also be necessary to spend £14,038 on new mains, sub-stations, &c. The Committee further reported that, owing to the exhaustion of existing borrowing arrangements, further powers were necessary to the extent of £66,500.

ELECTRICITY IN BULK.—The Committee reported that agreements had been arranged for the supply of electricity in bulk to the Woodbridge & District Electric Light Co., Ltd., and an East Suffolk company. The total cost of laying the mains, &c., was £12,700. The capital charges would be borne by the two companies, Woodbridge paying £300 per annum, and the East Suffolk company £900. For the energy the Woodbridge Company would pay a minimum of £500 for the first year, and £1,000 every subsequent year, and the East Suffolk company £500 for the first year, £750 for the second year, and £1,000 every subsequent year.

The reports were adopted by the Corporation.

Irish Free State.—ENNISCORTHY (Co. WEXFORD).—The Urban District Council's electricity undertaking was formally inaugurated on February 10th. The plant includes two semi-Diesel engines, and already 4½ miles of overhead lines have been erected. The cost of the scheme was £11,500.

Keighley.—ELECTRICITY CHARGES.—The Electricity Committee has recommended to the Town Council that for the half-year from September 30th, 1926, to March 31st next, all classes of lighting consumers other than occupiers of private dwellings be charged 1d. per kWh for all electricity consumed for lighting, heating, and cooking in excess of the quantity consumed during the corresponding six months of the previous year, and that all such accounts for the half-year be subject to a discount of 7½ per cent. for prompt payment.

Kirkham.—PROPOSED ELECTRICITY SUPPLY.—At a recent meeting of the Urban District Council the question of providing an electricity supply for the district was considered. It is proposed to obtain a supply from Preston Corporation, a cable being laid to connect up with the one now under construction between Preston and Blackpool. The Council decided to issue a questionnaire with a view to ascertaining the number of residents who would be prepared to take a supply.

Kingussie.—ELECTRICITY SUPPLY.—The secretary of the Grampian Electricity Supply Co. has informed the Town Council that the provision of a supply of electricity for the town is part of the company's programme, and that the necessary works will be put in hand in time for next winter. It is suggested that Newtonmore should be included in the scheme.

Lincoln.—ELECTRICITY EXTENSIONS.—In connection with the Electricity Committee's recommendation to provide a supply of electricity in the south-west part of the town, at an estimated cost of £40,000, the City Council has decided that expert advice be taken as to the proposed extensions and as to the policy to be adopted in regard to future developments of the electricity undertaking.

Llanfairfechan. — ELECTRICITY SCHEME. — The consulting engineer to the Urban District Council (Mr. Price White) is preparing a report on an electricity scheme for the town.

London.—BATTERSEA.—The Electricity Committee has prepared a scheme for additional mains on the Latchmere housing estate in order to provide electricity for heating and cooking. Only part of the estate will be dealt with in the first instance, the cost of mains being £2,000.

FULHAM.—The Finance Committee has recommended that application be made for sanction to a loan of £2,535 for sub-station equipment, mains, &c.

Long Eaton.—NEW PLANT.—The electrical engineer has recommended to the Town Council that two 500-kW motor convertors be installed at the electricity works, one to be installed immediately and one later. Application is to be made for sanction to a loan of £18,386 to cover the cost of the scheme.

Marlborough.—ELECTRICAL PROGRESS.—Practically all the street lamps have now been changed from gas to electric lighting, and good progress is being made with the wiring of the houses on the Council's estate.

Mexico. — HYDRO-ELECTRIC DEVELOPMENT. — Work has started on a scheme for supplying electricity in the Federal District of Mexico by utilising the waters of the River Lerma. The first installation will consist of two sets of 30,000 h.p. each, provision being made for extensions as needed for one or two additional sets of the same size. It is hoped to increase the sales of electrical energy before the end of the current year to 1,000 million kWh, the present output of the company holding the concession being approximately 600,000,000 kWh.—*Reuter's Trade Service* (Mexico City).

Newhaven.—INQUIRY.—The Electricity Commissioners have intimated to the Rural District Council that an inquiry is to be held at Brighton on March 15th with regard to the Telscombe and Piddinghoe Special Order which is being applied for by the Peacehaven Electric Light & Power Co., Ltd.

Northern Ireland.—PORTADOWN (Co. ARMAGH).—The electricity supply failed on February 8th as the result of an explosion, which was followed by an outbreak of fire at the local power station. The explosion was reported to be due to the bursting of the exhaust pipe of one of the engines. The outbreak was got under control by the fire brigade, but not before a considerable amount of damage had been done, including the destruction of the dynamo.

Nottingham.—LOAN.—The City Council has adopted a report of the Electricity Committee authorising application for sanction to borrow a further sum of £150,000, which is required for the general extension of mains in the city and district, transformers and switchgear in connection with the h.p. service, the erection of sub-stations, and for meters.

Palestine.—ELECTRICAL DEVELOPMENT.—In a report on the economic and financial situation of Palestine, issued by the Department of Overseas Trade, Mr. K. W. Stead, the Director of Customs in Palestine, gives some particulars of the growth of electrical power in that country during and up to 1925. The most important stimulant to local industry, he says, has been the establishment of electrical power stations at Tel-Aviv, Haifa, and Tiberias by the Palestine Electrical Co., Ltd. So great has been the demand for electricity at Tel-Aviv and Jaffa that the two engines, each of 500 h.p., which were first installed there, had to be supplemented by a third one of 250 h.p., and later by a fourth of 1,000 h.p.

Power is now supplied from the Tel-Aviv station to Petah Tikvah, the largest Jewish colony in the neighbourhood. The work of establishing a hydro-electric station on the Jordan was to be put in hand immediately. The first hydro-electric station, when completed, will have an output of 24,000 h.p.; others will be added as the necessity arises, up to a total capacity of 300,000 h.p.

Reigate.—Street Lighting.—The Highways and Works Committee has recommended the Town Council to instruct the electrical engineer to prepare a report upon the question of central overhead street lighting at Reigate and Redhill.

Spalding.—Special Order.—The Urban District Council has instructed its consulting engineers to take the necessary steps in conjunction with the Parliamentary agents to procure a Special Order authorising it to supply electricity in the rural district of Crowland and the parishes of Borough Fen and Newborough.

Special Orders.—Application has been made to the Electricity Commissioners for Special Orders by the following authorities:—The Weald Electricity Supply Co., Ltd., for the supply of electricity in certain parishes in the rural districts of Uckfield, Hailsham, Tonbridge, Maidstone, and Hollingbourne; Messrs Drake & Gorham, Ltd., to supply in parts of the rural districts of Chailey, Hailsham, and Uckfield; Mr. F. R. Hunter, in the urban district of Halesworth, and the parish of Holton; the Electric Supply Corporation, Ltd., to supply in parts of East and West Sussex.

The Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them authorising the Farnham Gas and Electricity Co. to supply electricity in the parish of Dockenfield and part of the parish of Frensham.

Thame.—Inauguration of Supply.—An electricity supply for the district was formally inaugurated by the wife of the chairman of the Urban District Council on February 10th. The supply is obtained from Aylesbury Corporation.

United States.—Hydro-Electric Development.—According to the *Electrical World*, the city of Seattle has filed with the Federal Power Commission an application for a licence covering its Skagit River development. According to the data submitted, the Ruby Dam, for which authorisation is sought, will produce a reservoir of 3,500,000 acre-ft. capacity. The head would be 445 ft. and the primary capacity 83,000 h.p. It is planned, however, to install six 54,000-h.p. sets. The Diablo Dam, forming part of the project, will back up the river to the Ruby Dam. The primary capacity is estimated at 108,000 h.p. Six 47,000-h.p. sets would be installed there. The Gorge Dam will create a reservoir holding 6,000 acre-ft. This water is to be used in the existing Gorge power plant. The primary capacity there is 150,000 h.p. At present 75,000 h.p. is installed. The ultimate installation proposed, however, is eight 37,500-h.p. sets.

Walton-le-Dale.—Street Lighting.—The Urban District Council on February 9th decided to ask the Lancashire Electric Power Co. to quote a price for converting the street lamps from gas to electric lighting.

Worcestershire.—Electrical Development.—During 1926 the Shropshire, Worcestershire and Staffordshire Electric Power Co. laid a total of 97 miles of cable. It is understood that the company's programme for cable laying during the current year will exceed this figure by at least 50 per cent.

Tramway and Railway Notes.

Aberdare.—Abandonment of Railless Cars.—The *Financial News* states that the Urban District Council is promoting a Bill this session to relinquish and discontinue permanently the whole of the railless-car routes within its district in respect of which Parliamentary powers have been obtained and the requisite overhead electrical equipment provided. The preamble of the Bill declares that "the running of trolley vehicles has been found impracticable and uneconomical." It is proposed to substitute motor-omnibuses on the routes authorised for railless cars.

Burnley.—New Cars.—The tramway manager has reported on the question of increasing the number of tramcars, and the Town Council has been recommended to authorise the purchase of five double-deck cars.

Bradford.—Fare Scheme Defeated.—The scheme for increasing the 1½d. fares to 2d. and reducing long-distance fares to an all-round figure of 3d., which has created considerable opposition, was defeated at a recent meeting of the Tramways Committee. The City Treasurer stated that some means must be found to stabilise the department's finances, as it is still faced with an increase of several thousands of pounds in its electricity bill for the half-year ended December last, and a loss in revenue of £15,000 during the general strike and coal strike periods.

Track Renewal.—The Tramways Committee has decided (subject to approval by the Corporation Estimates Sub-Committee) that the Leeds Road tramway track between Rushton Road and the Thornbury depôt shall be reconstructed, at an estimated cost of £2,709.

Railless Cars.—The Finance Committee has refused to consider a proposal that the substitution of railless cars on the Allerton tramway route should be deferred for a three-months' trial of motor-'buses.

Parliamentary Bill.—The Shipley Urban District Council has decided to support the Corporation's Parliamentary Bill for powers to extend its railless-car and motor-omnibus services to several districts beyond the city boundaries.

Continental.—Spain.—The Barcelona correspondent of the *Daily Mail* reports that the Northern Railway of Spain has recently placed an order for 22 electric locomotives. The electrical equipment is to be constructed in Switzerland and the mechanical parts in Bilbao by the Euskalduna Company. The locomotives are to be employed on the electrified lines from Barcelona to Manresa and to San Juan de las Abadesas, in the Pyrenees. Large sums are being spent on transport improvements in the country, and on the railways all main lines are to be provided with two roads. Large electrification schemes are being prepared, electrical energy being obtained by utilising the water-power resources of the country. The railway from Cerbère to Barcelona is to be electrified, as well as the coast line from Barcelona to Empalme.

Ipswich.—Railless Cars.—The *East Anglian Daily Times* reports that at a recent meeting of the Corporation the Electric Light and Transport Committee reported that the conversion of the gear for the use of the railless cars had entailed an excess expenditure over the estimates (£10,000) of £1,800. The extensions of the system to Grove Lane, Foxhall Road, London Road, Felixstowe Road, and Bramford Road had entailed an expenditure of £13,380. The needs of the service had also called for more vehicles than provided in the Act. In all, 35 vehicles had been purchased, at a cost of £53,500, and there were occasions when there were no spare vehicles available. The borrowing powers amounted to £45,000 for 30 vehicles, leaving an excess of £8,500, towards which £1,892 had been contributed out of revenue, leaving £6,608 to be provided by loan. The Committee anticipated that in order to cope adequately with the additional passengers and the new routes, and to provide spares for emergency, six further vehicles would probably be required in due course, at an estimated cost of £9,600. The Committee had had under careful consideration the occasions when interruptions to the service had occurred, and it had been found that these had been mainly due to the old feeder system being inadequate to meet the demands. It recommended the installation of a duplicate system of feeders throughout the system, at a cost of £2,130. The Committee asked for sanction to apply for loans amounting to £13,743 in connection with the system. The report was adopted by the Corporation.

Japan.—Railway Electrification.—It is reported that the Central Government has granted the application of the Toyama Prefectural Office for permission to electrify its railway, and work on the construction of the sub-station will commence shortly.

Sunderland.—Track Renewal.—The Town Council has decided to relay the tramway track in Fawcett Street, at an estimated cost of £9,000. The remainder of the carriage-way will also be laid with lithocrete, at an estimated cost of £4,250.

Telegraph and Telephone Notes.

Belgium.—Short-Wave Radio-Telegraphy.—The Société Belge Radio-Electrique, of Brussels, in its report for last year, states that it has established a short-wave wireless telegraph service between Belgium and the Belgian Congo, which is now working satisfactorily.

Canada.—Long-distance Telegraph Line.—The Canadian Pacific system has started work on a second trans-Canada telegraph line, 3,000 miles in length, extending from Montreal to Banfield, on Vancouver Island, passing through Sudbury, Fort William, Winnipeg, Moose Jaw, Calgary, Nelson, Penticton, Vancouver and Alberni. At Banfield the line will connect with the second Pacific Cable Board undersea circuit that goes to Fanning Island, Suva, Auckland, and Sydney. The work will be completed in about two months, at an estimated cost of about $423,520, says the *Financial News*, and will forge another link in the chain between Great Britain, Canada, New Zealand, and Australia.

Germany.—Cheaper Telephones.—Telephone installation fees are to be greatly reduced, and monthly rentals are to be cut from 5 to 12 marks to from 3 to 9 marks per month. Forty free calls will be allowed, after which the price per call will be 10.9 or 8 pfennigs per call, according to the zone, instead of a flat rate of 15 pfennigs as at present. Trunk calls for distances of 15 to 75 kilometres are to be reduced from 45, 90 and 120 pfennigs, to 40, 60 and 90 pfennigs, and after the expiration of the usual three minutes, conversations will be charged for per minute, instead of periods of three minutes. Between 7 p.m. and 8 a.m. long-distance calls are to be charged at two-thirds the day rates.—*Reuter* (Cologne).

Gibraltar.—New Telephone Line.—The Spanish Government has approved of the establishment of a telephone line between La Linea and Gibraltar.

Guatemala.—Telephone and Telegraph Systems.—The telegraph and telephone systems are operated by the Government as one unit. The combined systems reported a deficit of 13,477,666 pesos for the year 1925 (the latest figures available), says *Commerce Reports*. There were 261 telegraph offices operating in the Republic at the end of the year, of which 5 were inaugurated in 1925; the 11 new central telephone stations opened during the year brought the total in operation in the country to 87. Telegraph lines aggregated 6,871 kilometres, and the national telephone lines had a combined length of more than 3,603 kilometres. At the end of 1925 there were 1,992 telephones in use in the Republic, representing an increase of 775 instruments since 1923. Work on the new automatic telephone system in the capital city has begun.

Irish Free State.—Wireless Advisory Committee.—The preliminary arrangements are being made for the establishment of the Free State Advisory Committee under the provisions of the Wireless Telegraph Act. The Provisional Advisory Committee already in existence will be superseded by the new body. The Ministries for Education, for Lands and Agriculture, and for Posts and Telegraphs, are to be represented on the Committee.

Transatlantic Telephony.—Satisfactory Working.—The first month's operation of the Transatlantic radiophone service has been a commercial success, according to the management, which states that the receipts satisfactorily exceeded the expenditure, adding that Americans lived up to their reputation as extravagant telephone users, having made an average of nine calls for every five British calls.—*Reuter* (New York).

A commercial telephone service between Chicago and Detroit and London was inaugurated on February 12th.—*Reuter* (New York).

The Telephone Service.—New Belfast Exchange.—Negotiations for the sale of a very large block of property in Belfast have been completed, the purchaser being the British Postmaster-General, who requires the premises for a new central telephone exchange, and it is understood that the automatic system will also be brought into operation.

Radio Notes.

Belgium.—International Conference.—The engineers who met recently in Brussels under the chairmanship of M. Raymond Braillard, president of the Technical Commission of the International Radiophony Union, examined the subject of transmission interference on long wavelengths; provisional regulations were decided upon and a detailed programme of tests arranged. Another matter discussed was electrical interference caused by tramways, lifts, illuminated signs, &c., says *World Radio*. The Conference coincided with meetings of the Bureau and of the Juridical Commission of the Union, presided over by Herr Giesecke and Dr. Sourek respectively, and Radio Belgique entertained the delegates (among whom were representatives of Russian broadcasting).

Denmark.—Licence Fee Reduced.—The law relative to annual licence fees was recently revised: according to *Commerce Reports*, all apparatus acquired or constructed after October 1st, 1926, is subject to a fee of 5 crowns in the case of a crystal set and of 7.5 crowns in the case of a valve set, or set in which valve amplifiers are used. These figures represent a reduction of 50 per cent.

Germany.—Licences.—At the end of 1926 a total of 1,376,564 licences had been issued, the number of applications during December having been 39,442. Unlicensed listeners are said to be fewer in Germany than in any other country. The fee is payable monthly (2s.).

Licences.—P.O. Ruling.—In a written reply to a question in the House of Commons, Lord Wolmer, Assistant Postmaster-General, is reported to have said: "A receiving licence entitled the licensee to use apparatus in the premises occupied by him. One licence will cover any number of sets installed in the same premises for the use of the licensee, his family, or his servants, but any other person occupying a portion of the same house under a separate tenancy and desiring to install receiving apparatus must take out a separate licence. When a licensee runs telephone leads from his set to the house of a neighbour, or to any premises other than those in his own occupation, for the purpose of conveying broadcast programmes thereto, a separate licence is necessary for such premises."

Poland.—New Station.—The latest addition to European long-wave stations is that at Warsaw, transmitting on 1,013 metres with an input of 10 kW to the main oscillator valve, which was built by Marconi's Wireless Telegraph Co., Ltd. The transmitter (a QD8 set) was designed on the same lines as that at the Daventry station, the six main units being contained in aluminium frames: four are open and contain the valves for the independent drive, main oscillator, modulator and rectifier circuits, and the two enclosed units are the speech transformer and the coupling unit for the drive main oscillator grid circuit. The station belongs to the Polish Broadcasting Co., and has been built at Fort Mokotow on farm land belonging to the municipality. Power is obtained from the city supply at 3,000 volts, three-phase, being transformed at the station to 210 volts. The rectifiers, main modulator, and main oscillator valves are of the Marconi cooled-anode type, and the drive and sub-modulator of the glass air-cooled type. The aerial is carried on two self-supporting lattice steel masts 75 metres high, and the aerial current is 30 amperes. The range of reception in Poland is 75 miles with a crystal receiver and 375 miles with a two-valve receiver; the station has been heard in this country, when the B.C.C. stations were closed down, on a 2-valve receiver. Short wood poles were used to carry an earth screen which was erected to compare results with those obtained with an "earth" proper, and the latter was found to give the better performance.

Reality in Reception.—Birmingham Demonstration.—The second of the series of talks which Mr. Colin H. Gardner has been giving from the Birmingham station was particularly interesting. The first talk was accompanied by demonstrations by which it was hoped listeners would be enabled to ascertain what distortion was being caused in their receivers; a large number of reports of reception were received, which showed that in all probability only a very small proportion of listeners get from their sets anything like the degree of purity and full range of musical values that is possible with a well-designed instrument. One of the test transmissions comprised the notes of instruments which register a very low pitch, and the great majority of reports stressed the unsatisfactory nature of these notes. Only in cases of listeners using resistance-capacity coupled receivers in conjunction with loud-speakers of the cone type was satisfactory reception reported.

South Africa.—Johannesburg Station Closed.—Amid expressions of regret and appreciation, the Johannesburg broadcasting station, the most important in the Union, closed down on January 31st.

As the result of a conference of those interested in the resumption of broadcasting, three schemes have been submitted to the Minister of Posts and Telegraphs, who had promised to issue a licence for any scheme chosen by a representative committee. *The Times* understands that the Minister favours the proposal of the Mayor of Johannesburg that the cost of broadcasting shall be borne by the Reef municipalities. He is definitely of opinion that sooner or later the service must become a State-aided enterprise. While negotiations are proceeding, the Transvaal Radio Society undertook to resume the service from February 7th.

United States.—New Station.—New York City's newest station (WGL) was opened on January 30th, and marked the inauguration of the activities of the International Broadcasting Co., which operates the station; its power is 1 kW, and wave-length 442 metres, which figure may be changed to 422 m. if interference occurs.

New Company.—The new Atlantic Broadcasting Corporation, with headquarters in New York, has purchased the Grebe group of stations, including the new 5,000-watt transmitter WABC. The new organisation has its studio and reception rooms in Steinway Hall; all transmitters are located at Long Island. An elaborate mixing or fading system in connection with a large number of microphones, permits, says the *T. and T. Age*, the proper blending of the various elements of the broadcast presentation. The frequency control system of the 5-kW transmitter is of such stability that a change of even one-tenth of one per cent. in wave-length is not likely to occur.

Legislation Compromise.—A tentative agreement has been reached at Washington, where conferences have for months been considering the problem of air control and order. The agreement appears to have the support of adherents of the White Bill, which the House of Representatives passed, and of those favouring the Dill Bill, which the Senate passed. According to *World Radio*, it contains no provision for censorship, calls for the creation of a commission of five, the members of which are to be appointed by the President of the United States, and to serve for six years; each commissioner will represent one of five zones created. The Commission will have jurisdiction as to granting, renewal and revocation of all station licences and making regulations for a period of one year, at the end of which the Commission shall decide only controversial matters which the Secretary of Commerce of the United States places before it and appeals from decisions he has handed down. The decrees of the Commission are to be final, to be reviewed only by the courts. Complete control over operators and the issue of their licences is given to the Secretary of Commerce. All administrative functions are entrusted to him. After one year he will be given original jurisdiction over the granting and renewal of station licences in relation to which there is no controversy or appeal. The Commissioners will receive $10,000 a year for the first year, and thereafter $30 a day and travelling expenses.

Wireless Organisations Committee.—High-Power Stations.—At its second meeting on February 14th, the Wireless Organisations Committee decided to ask the Postmaster-General to take an early opportunity to assure listeners that a system of high-power regional distribution effective for the transmission of alternative programmes will be fully expedited so far as his department is concerned. The next meeting of the Committee will be held on February 28th.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the ELECTRICAL REVIEW containing the advertisement is given in parentheses below.

Contracts Open.

Australia.—SYDNEY.—April 6th. New South Wales State Railways. One 7,500-kW turbo-alternator. (B.X. 3179.)*
March 2nd. Wires and cables. (B.X. 3232.)*
MELBOURNE.—April 5th. Postmaster-General's Department. Condensers. (B.X. 3215.)*
March 30th. Victorian Railways. Lightning arresters. (B.X. 3213.)*
BRISBANE.—April 13th. Brisbane City Electric Light Co., Ltd. Transformers. (B.X. 3218.)*

Bedford. — February 28th. Electricity Department. Twelve months' supplies of e.h.p. and l.p. cables and incandescent electric lamps. (February 11th.)

Belgium.—SAINT GILLES, BRUSSELS.—March 1st. Municipal Council. Armoured cables, junction boxes, and electricity meters. Particulars (Cahier des Charges) for 5 fr. each lot from Service de l'Electricité, 40, Rue de Bethléem, Saint Gilles.

Bristol.—February 24th. Board of Guardians. Electrical fittings for six months. Mr. T. S. Lamb, clerk, St. Peter's Hospital.

Canterbury.—February 21st. Electricity Department. L.p. lead-covered and armoured feeder cables. (February 4th.)

Cardiff. — February 23rd. Electricity Department. Twelve months' supply of paper-insulated cables. (February 4th.)

Cheadle and Gatley.—March 1st. Electricity Department. Annual contracts for lamps, meters, and wood covering boards. (See this issue.)

Croydon.—March 3rd. Electricity Department. 12,000 tons of coal suitable for use on chain-grate mechanical stokers. (February 4th.)

Dublin.—March 2nd. Great Northern Railway (Ireland). Stores for nine months, including electric fittings, lamps, cable and wire. (See this issue.)

Dundee.—February 28th. Education Committee. Electrical installation for the new secondary school, Perth Road. Messrs. Thoms & Wilkie, architects, 21, South Tay Street, Dundee.

Egypt.—Egyptian State Railways, Telegraphs and Telephones. Chief Inspecting Engineer, Queen Anne's Chambers, Broadway, Westminster, S.W.1. Telegraph and telephone materials.—*Reuter's Trade Service* (Cairo).
CAIRO.—March 3rd. Ministry of Public Works. Two internal-combustion engines and accessories for the Egyptian Army Flour Mills, Tura, near Cairo. (A.X. 4187.)*

Harrogate.—February 28th. Electric lighting installation for St. Mark's Church, Leeds Road. Particulars from the Verger.

India.—March 22nd. India Store Department. Two 250-kW Diesel-engine alternator sets, with switchgear, transformer, &c. (See this issue.)

Leeds.—March 2nd. Tramways and Transport Committee. Materials, including electrical sundries required during year ended March 31st, 1928. General manager.

London.—METROPOLITAN ASYLUMS BOARD.—February 23rd. Installation of electric lighting at Millfield, Rustington, near Littlehampton, Sussex. (February 4th.)
STEPNEY.—March 3rd. Board of Guardians. Electrical fittings for 6 months. Mr. S. McClelland, clerk to the Guardians, Bancroft Road, Mile End, E.1.

Littlehampton.—March 8th. Sussex Electricity Supply Co., Ltd. One 150-kW Diesel engine and generator with auxiliaries, switchgear and cables. (See this issue.)

Long Eaton.—February 24th. Electricity Department. One 500-kW convertor set and one switchboard platform. (February 4th.)

New Zealand.—WELLINGTON.—March 4th. Poverty Bay Electric Power Board. Switchgear and transformers. (B.X. 3160.)*
April 26th. Public Works Department. Secondary battery for the Lake Coleridge scheme. (B.X. 3202.)*

Newark-upon-Trent.—February 22nd. Electricity Department. Gasfilled electric lamps for street lighting for 12 months. (February 11th.)

South Africa.—JOHANNESBURG.—March 19th. Municipal Council. Transformers. (B.X. 3219.)*
March 3rd. South African Railways and Harbours. Overhead line material. (B.X. 3224.)*
CAPE TOWN.—March 9th. Electricity Department. Insulated wire. (B.X. 3233.)*

South Elmsall.—March 19th. Electric lighting installation at Westfield Lane Council School. Education Department, County Hall, Wakefield.

Stoke-on-Trent.—March 8th. Electricity Department. De-aerating plant and electrically-driven boiler-feed pumps. (See this issue.)

Spalding.—February 26th. Urban District Council. 28 sets of centrifugal pumps (for sewage pumping), including electric motors, automatic starters, floats, valves, pipes, &c. Mr. C. F. Murphy, Lloyd's Bank Chambers, Morpeth.

Torquay.—March 11th. Electricity Department. Two water-tube boilers with chain grate stokers, induced draught plant, pipework and economisers. (See this issue.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Coventry.—Board of Guardians. Accepted:—
Two electric ovens (£187), one 2-pan fish fryer (£63), two 6-gallon hot-water urns (£24).—Jackson Electric Stove Co., Ltd.

Chesterfield.—Electricity Committee. Accepted:—
Cable (£1,360).—Hogan & Wardrop, Ltd.

London.—ADMIRALTY.—
Resistance rods.—Edison Swan Electric Co., Ltd.

LONDON COUNTY COUNCIL.—*Correction.*—We regret to find that in the list of tenders for the Lomond Grove School installation published here last week, through a printer's error we gave the amount of Messrs. Anderson, Angell & Co.'s tender as £327 instead of £322. This made it appear that the tender of Messrs. Dean & Co., Ltd., was the lowest submitted, although it was not accepted. The accepted tender was for £322, but Messrs. Dean's quotation was £324.

ELDER DEMPSTER LINE.
Twelve months' contract for the supply of "Osram" lamps.—General Electric Co., Ltd.

ST. PANCRAS.—Electricity Committee. Recommended:—
Cable (£967).—Standard Telephones & Cables, Ltd.

Portsmouth.—Education Committee. Recommended:—
Installation of electric lighting at Futcher School.—Southey, Ltd.
Electricity Committee. Recommended:—
Low-pressure cable (£575).—Johnson & Phillips, Ltd.
Repairs to 500-V battery (£807).—Tudor Accumulator Co., Ltd.
Plant, &c., at generating station:—

Name of tenderer.	Boiler.	Stokers, induced and forced draught plant.	Overhead bunker.	Steel building.
	£	£	£	£
Babcock & Wilcox, Ltd. (Recommended.) ...	**19,600**	**8,650**	2,785	5,015
Vickers Boiler Co., Ltd. ...	19,500	10,010	2,042	4,490
John Thompson Water Tube Boilers, Ltd. ...	20,940	6,328	3,157	4,032
Clarke, Chapman & Co., Ltd.	19,938	7,568	3,760	6,888
Simon Carves, Ltd. ...	24,503	6,789	1,827	4,277
Fraser & Chalmers Engineering Co. ... ... (a)	29,104	12,054	1,778	6,433
Ditto ditto ... ... (b)	24,799	11,487	1,778	6,433
British Niclausse Boiler Co., Ltd.	14,275	6,600	3,250	6,500
Peirson & Co., Ltd. (Recommended.)	—	—	**1,650**	**4,200**

East Ham.—Electricity Committee. Recommended:—
Two switches (£128).—A. Reyrolle & Co., Ltd.

Gravesend.—Electricity Committee. Recommended:—
Boiler (£12,647).—Babcock & Wilcox, Ltd.

South Africa.—CAPE TOWN.—Electricity Committee. Recommended:—
1,100 electric lighting poles, with wrought-iron tubes (£6,592).—V. Soper.
5 gross fuse carriers (£290), 1,000 street lighting fittings (£1,134), 1,000 street lighting tube sets (£101).—Griffin Engineering Co., Ltd.
6,000 galv. spindles (£115), 500 stay rods (£259), 5,000 shackle insulators (£215).—British Insulated Cables, Ltd.
5,000 insulators (£102), 3,000 lb. tinned copper binding wire (£133).—British General Electric Co., Ltd.

Tenterden.—Town Council. Accepted:—
Installing electric light at 24 houses (£165).—G. E. Wallis and Sons, Ltd.

Tring.—Urban Council. Accepted:—
Installing electric lighting at the market house and fire station.—Ackerman & Crawford, Leighton Buzzard (£40).

Weymouth.—Housing Committee. Accepted:—
Wiring 100 houses on the Westhan Estate (£5 8s. for parlour type and £4 16s. for non-parlour type).—Mr. P. W. Child.

Electricity Committee. Accepted:—
Distributor cables for Goldcroft Estate (£825).—Johnson and Phillips, Ltd.

Forthcoming Events.

British Electrical Development Association.—Friday, February 18th. Royal Society of Arts. 7.30 p.m. "Assisted Wiring Schemes." Mr. W. F. T. Pinkney.

Junior Institution of Engineers.—Friday, February 18th. 39, Victoria Street, S.W. 7.30 p.m. "Modern Concrete Construction." Mr. L. Turner.

Royal Society of Arts.—Monday, February 21st. 8 p.m. Cantor Lecture. "Photo-elastic Measurements of Stress Distribution." Prof. E. G. Coker, F.R.S.

British Industries Fair.—February 21st to March 4th. White City, London, W., and Castle Bromwich Aerodrome, Birmingham.

Institution of Electrical Engineers.—INFORMAL MEETING.—London. Monday, February 21st. 7 p.m. "National Busbars of Central Europe." Mr. R. O. Kapp.

(Mersey and North Wales (Liverpool) Centre).—Monday, February 21st. University, Liverpool. 7 p.m. "Recent developments in Radio Reception." Mr. J. H. Reyner.

(North-Midland Centre).—Tuesday, February 22nd. Hotel Metropole, Leeds. 7 p.m. "Notes on the 60,000-V Underground Network of the Union d'Electricité." Col. E. Mercier.

(North-Western Centre).—Tuesday, February 22nd. College of Technology, Manchester. 7.30 p.m. Faraday Lecture. "What is Electricity?" Prof. W. M. Thornton.

(Western Centre).—Joint meeting with the South Wales Institute of Engineers, &c. Tuesday, February 22nd. Cardiff. 4 p.m. "Electro-Farming or the applications of Electricity to Agriculture." Mr. R. Borlase Matthews.

Wednesday, February 23rd. Swansea Corporation Electricity Department Showrooms. 6.30 p.m. Mr. R. Borlase Matthews will repeat the lecture on "Electro Farming."

(South-Midland Students' Section).—Tuesday, February 22nd. Grand Hotel, Birmingham. 8 p.m.-2 a.m. First Midland Student Engineers' Ball.

Paisley Association of Electrical Engineers.—Tuesday, February 22nd. Town Hall, Paisley. 7.30 p.m. "Electricity in Medical Practice." Dr. W. J. C. Watt.

Illuminating Engineering Society.—Tuesday, February 22nd. Royal Society of Arts. 6.30 p.m. "Artificial Lights as an Aid to Aerial Navigation." Mr. H. N. Green.

Electrical Power Engineers' Association.—Wednesday, February 23rd. Engineering and Scientific Club, Wolverhampton. 7 p.m. "Boilers, Past and Present." Mr. G. W. L. Wolland.

Association of Consulting Engineers.—Wednesday, February 23rd. St. Stephen's Club, Westminster. 7 p.m. Annual dinner.

Electrical Wholesalers' Federation.—Thursday, February 24th. Savoy Hotel, Strand, W.C.2. 7.30 p.m. Annual dinner.

Birmingham Electric Club.—Friday, February 25th. Grand Hotel. 7 p.m. "Wireless Telephony." Mr. C. G. A. McDonald.

Institution of Engineering Inspection.—Friday, February 25th. Royal Society of Arts. 7.30 p.m. "The Economic Production of Steam by Electricity." Mr. C. J. Wharton.

Physical Society.—Friday, February 25th. Imperial College of Science, S. Kensington, S.W. 5 p.m. Guthrie Lecture. "Atomic Nuclei and their Transformations." Sir Ernest Rutherford, F.R.S.

National Association of Supervising Electricians.—Saturday, February 26th. Holborn Restaurant. Annual dinner.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—

MAGICOLOUR system of lighting
FARRINGDON lamp locking rings.
Moulded glass letters for use on illuminated signs.

We also have a request for the address of Messrs. Silcock and Tongue, formerly of Aston, Birmingham.

Notes.

The Electrical Engineers' Ball.

The twenty-third Electrical Engineers' Ball was held at the Hotel Cecil, on Friday, February 11th, and, as usual, was a splendidly organised and most enjoyable function, in which a large number of well-known members of the electrical profession took part. The arrangements made for the pleasure and comfort of the guests left nothing to be desired, and Messrs. A. M. Sillar and C. W. Hill, with their Executive colleagues, may be most heartily congratulated on having achieved so completely successful a result.

Iron and Steel Trades Development.

Sir William J. Larke (director of the National Federation of Iron and Steel Manufacturers), at a general meeting of the Birmingham Chamber of Commerce last week, spoke of the gradual recovery of the iron and steel industry. There were, he said, 150 blast furnaces working in this country at the end of January, and this was more than before the general strike. According to the incomplete figures available, the production of steel in January reached 720,000 tons, whereas in January, 1926, it was 640,000 tons. He said, however, that they must not imagine that because they had a period of four or five months of activity to look forward to, they were positively finished with industrial depression. It might be so; but a great deal depended upon themselves—upon whether they could found on this period of activity a complete and permanent industrial revival. He suggested that the Government should devote more aggressive attention to the export trade. Speaking of the development of the iron and steel industry within the Empire, Sir William emphasised the importance of pursuing a policy of co-operation with the Dominions and Dependencies. The Empire already absorbed 50 per cent. of the iron and steel exported from this country. The best thing for the industry in this country was that businesses of a similar kind in other parts of the Empire should be developed along the most economic lines possible.

Electrical Survey Costs.

Included in a Supplementary Estimate issued last week was an item of £14,000, representing the additional amount of fees and expenses of consulting engineers, and expenses of the technical survey for a general scheme of generation and transmission of electricity in Great Britain, including field surveys of Central England, and the Glasgow and Clyde Valley areas, carried out by the Ministry of Transport, making a total of £23,200. These fees are recoverable from the Central Electricity Board. Against the extra expenditure there is a saving under other sub-heads of £6,290, and increased appropriations in aid of £7,700, so that the net increase of the estimate is only £10.

National Association of Supervising Electricians.

At the annual general meeting of the Association on Tuesday last, the report of the Board of Control for the past year was submitted. It stated that the position of the Association was again improved, both financially and numerically. Many lectures had been delivered to the members, and many visits paid to works, &c. The competitions for the W. E. Highfield Shield, the N.A.S.E. Scholarships, and the Economic Premiums had been exceptionally successful. The number of members registering with the Employment Bureau was about 1 per cent. of the membership, and the positions secured through the Bureau carried salaries of £250 to £1,000 a year. Through the Operatives' Section 147 operatives were placed. New rules were drafted, and were to be settled at last Tuesday's meeting.

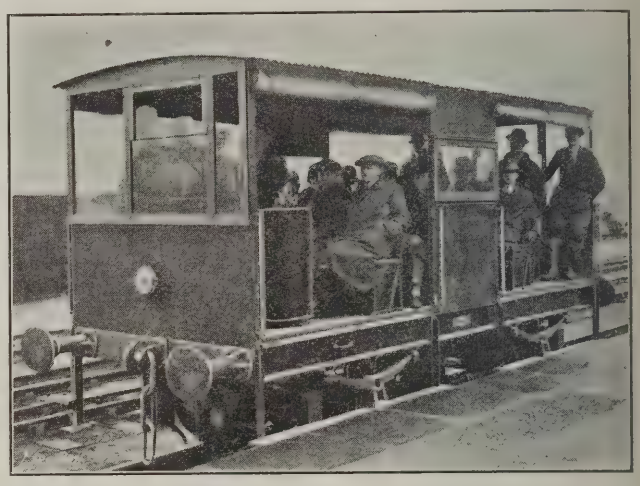
Lectures.

Prof. C. T. R. Wilson, University Reader in Electrical Meteorology at Cambridge, recently lectured on "Thunderclouds" at the Leeds University, explaining that between one and two thousand thunderstorms were generally, at any moment, in action in some place or other on the earth, producing more than a hundred flashes of lightning per second. Thunderstorms consequently formed an important factor in the physics of the earth and atmosphere. Photographs were shown of the apparatus used at Cambridge for measuring electrical phenomena. Automatic records of thunderstorms, says the *Yorkshire Post*, indicated the destruction of electric fields induced in the earth, and the record showed also the way in which the field was regenerated after such destruction. Flashes of lightning made a difference in the charge of the earth under a thundercloud of the order of 10,000 volts a metre. It was due to these sudden charges that one commonly felt very uncomfortable. The ordinary thundercloud consisted of a stratum positively electrified, separated by a neutral stratum from one negatively electrified, discharging by flashes of the order of a kilometre in length; the positive pole was at the top and the negative below. About a million kilowatt-hours was expended in a single flash of lightning, an enormous waste of useful energy, but one need hardly worry, remembering that it was only the 10,000th part of the energy which the sun supplied in the same time.

Mr. Henry McEwen read a paper on the effects of longitude in relation to electric lighting at a recent meeting of the Glasgow Corporation Electricity Department Engineering Society. He pointed out that in America, with its large extension in longitude, co-operation was arranged among power stations in neighbouring longitude zones where the times of largest demand were different. At Copenhagen electrical energy was obtained from Sweden across the 11 miles of the Little Belt. The problem of the mutual use of English and Irish power stations might be dealt with at some future time, though in that case submarine transmission of 50 miles was involved.

Appointments Vacant.

Linesman for the Bethesda Urban District Council; assistant mains engineer (£285) for the Lincoln Corporation Electricity Department; workshop superintendent for the Burma Electric Supply Co., Ltd.; mechanical engineer (£600) for the River Shannon Hydro Electric Development. (See our advertisement pages to-day.)



Extensions at Great Yarmouth.

The extensions to the generating plant and distribution system at Great Yarmouth, which are described in our last and this issue, were officially inaugurated by Alderman W. G. Knights, chairman of the Great Yarmouth Electricity Committee, on February 10th. At a celebration luncheon after the ceremony the Mayor of Lowestoft referred to the agreement which had recently been arrived at between Yarmouth and Lowestoft for the former town to supply the latter with electricity in bulk. Lowestoft had not the water facilities at its power station that Yarmouth had. The chairman, in reply, pointed out the advantages to both towns which would accrue from the arrangements. Mr. P. G. Campling, the engineer and manager of the undertaking, said that the total expenditure on the extensions would amount to something like £250,000. All the new plant was British. On behalf of the contractors, Mr. A. T. Brotherton, of the Brush Electrical Engineering Co., Ltd., presented the chairman with a suitably inscribed silver salver. Mr. J. Andrew Lee, of the Electricity Commission, paid a tribute to Mr. Campling for the work he had done on the undertaking.

The "Otley" Rail Car.

An electric rail car that will carry sixteen passengers and cost little to run, the invention of Electromobile, Ltd., was recently put on to the railway at Otley and, following preliminary runs, it carried a load of passengers to Pool, where it was inspected by representatives of the railway companies. Later it will go to Shoeburyness, where it will be used by the War Office on a branch line for conveying artillerymen to the gun ranges. The car is entirely self-contained. The traction battery which supplies the motive power is divided into sections which occupy the space beneath the passengers' seats. Whenever the car is waiting at a terminus, it can be put on charge simply by inserting a charge plug. The "Otley" car has open sides with side curtains, because it has been built to the specifications of the War Office. For ordinary passenger traffic, it could be fitted with an enclosed body, and for winter use electric radiators could be fitted. The firm is now engaged on the construction of a locomotive of similar type, but much heavier, required by the War Office for hauling naval guns. It will be capable of drawing a dead weight of 300 tons.

These vehicles are of interest at the present time when our railways are having to give serious consideration to the problem of retaining and winning back branch-line traffic. What is required is a vehicle with the seating accommodation of one or two 'buses, of which the running costs are very low, which can work with the ordinary rolling stock if necessary, so that a frequent service of small units can combat 'bus competition. It is to meet these conditions that the "Otley" rail car has been built: apart from the driver's

The "Otley" Rail Car.

seat at either end, with the brake and control gear, no useful space is taken up by the driving mechanism. The two electric motors are carried beneath the main frame, where each of them drives an axle through a countershaft. Each motor with its countershaft is carried on a bracket, pivoted at one end on the main axle and supported at the other end between helical springs that take up the initial torque at starting and stopping, and absorb the jar. In addition to screw brakes acting on the wheels, electrical braking is provided. The Exide-Ironclad battery makers are prepared to enter into a long maintenance contract, if required, so that costs can be accurately forecast. Below are the main dimensions of the car:—

Gauge	4 ft. 8½ in.
Wheelbase	9 ft. 0 in.
Wheel diameter	3 ft. 1 in.
Length over buffers	20 ft. 6 in.
Height over roof	10 ft. 7½ in.
Maximum width	8 ft. 2 in.
Weight, complete	10 tons
Tractive effort, maximum	2,000 lb.
Tractive effort, continuous	400 lb.
Battery capacity	33 kW
Average discharge pressure	200 volts
Number of cells	108
Capacity, ampere-hours	161
Speed at one hour rating	17 m.p.h.
Haulage capacity	6 tons

Ex-British Westinghouse Association.

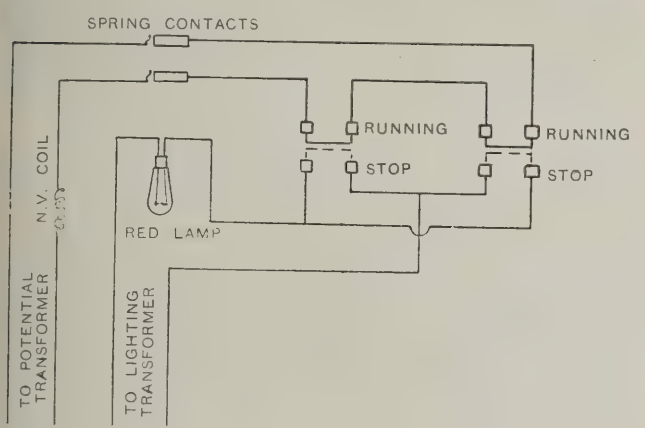
On March 11th the ninth re-union dinner of this Association will be held at the Hotel Cecil, Mr. L. R. Morshead presiding. Tickets (12s. 6d.) can be obtained from Mr. W. E. Warrilow, 40, Mildred Avenue, Watford, Herts.

Long Service.

The Siemens Magazine for February records a presentation to three members of the staff of Siemens Brothers & Co., Ltd., who had simultaneously completed 50 years' service with the firm—Messrs. A. Watts, W. Marsh, and A. Chard. Including these veterans, 26 men have served the company for half a century, and there are nine men at work still whose total period of service amounts to 464 years.

Research in the United States.

The annual report of the Director of the U.S.A. Bureau of Standards (Misc. Publication No. 75) covers a very wide field of activities. During the year ended June 30th last the Bureau tested 62,648 items for the public, involving 205,789 determinations, the fees amounting to $52,033. Tests for Government Departments and State institutions numbered 68,930, involving 253,671 determinations, valued at $301,833; and for the Bureau itself, 11,865 items, 33,532 determinations, valued at $66,192—grand totals, 143,443 items, 492,992 determinations, $420,058. The Bureau, in addition, inspected 1½ million incandescent lamps for other branches of the Government, and for its own work of research and standardisation tested 36,406 items, making 166,866 determinations, the value of which would amount to $254,988. Salaries amounted to $516,760.



Out of the many subjects dealt with we note that a special blue glass was developed for the use of workmen engaged in electric or acetylene welding and cutting, furnace work, and the like, which afforded sufficient contrast between the melt and the furnace walls whilst cutting out the harmful ultra-violet rays. Much valuable work was done in connection with the standardisation of radio apparatus, automobile headlights, dry cells, and other items. The use of chromium for plating steel printing plates was developed, the life of the plates being greatly increased thereby. New power plant and operating equipment costing $500,000 was urgently needed. The total expenditure during the year was $1,968,333.

Franklin's Rod.

A small portion of St. Paul's Cathedral has been sent "as a gift" to America. It is a section of the old iron lightning rod fixed under the supervision of Benjamin Franklin, and now superseded, says the *Evening News;* it connected the existing metal work between the ground level and the cross of the cathedral, and the specimen piece is about ten and a half inches long and weighs nine and a half pounds. Mr. E. J. Bolwell, clerk of works, said: "It will not be missed, and our friends on the other side expressed a keen desire to have this specimen of Franklin's work in a museum.

A Remote Safety Device.

The accompanying illustration shows the arrangement which has been adopted at the Birmingham works of Messrs. Henry Wiggin & Co., Ltd., for the remote safety control of a 750-h.p., 5,000-V, a.c. motor, driving a three-high rolling mill. The motor did not originally include any device for remote control, nor was there any interlock between the liquid starter and the truck-type switch panel, so that the switch could be

closed with the starter "on." It soon became evident that it was highly desirable that the men at the rolls should be able to stop the motor from one or more points within the mill, and that some safeguard should be provided against inadvertently closing the switch before opening the rotor circuit by turning the starter to the "off" position. The method adopted is to continue the no-volt release circuit to the various points from which it is desirable to stop the motor. At each of these points, connected in series, is a small change-over switch with two positions marked "running" and "stop." When the motor is stopped from one of the control points the change-over switch is reversed from the "running" to the "stop" position, thereby opening the no-volt circuit. This also closes a circuit in which is a red lamp placed so as to be easily seen by the operator at the motor switch. The liquid starter must be turned "off" before the lamp is extinguished by restoring whichever remote control switch has been used to the "running" position. The main switch may then be closed. The system was devised by Mr. H. Williamson, the works engineer.

B.E.S.A. Publication.

The British Engineering Standards Association has recently issued a specification for switchgear cells and cubicles constructed of moulded stone. It is divided into two parts, one dealing with cubicles constructed from pre-cast units, and the other with cubicles constructed in position. It defines the terms "concrete," "slabs," and "mouldings," and indicates the materials to be employed and the method of mixing in the preparation of "concrete." It also defines the finish of "slabs" and "mouldings," and lays down acceptance tests to be made at periods of from 4 to 12 weeks in the age of the slabs. In the case of mouldings, tests are to be taken on slabs taken from the same mix as the mouldings. The tests consist of the application of an evenly distributed load on a central area over the width of the slabs and parallel to the ends where they are freely supported. The general principles to be followed in the design of cubicles are also indicated. The specification is of special interest to all switchgear purchasers and manufacturers, since the sound construction of cells is of the utmost importance in connection with modern switchgear, when complete phase separation and also the separation of individual apparatus are essential features, which can only be properly attained by the use of good-quality materials employed in a suitable manner. Copies of this new B.S. specification may be obtained from the B.E.S.A. Publications Department, 28, Victoria Street, S.W.1. Price 2s. 2d. post free.

Association of Special Libraries and Information Bureaux.

On Wednesday, February 23rd, a meeting will be held at the Royal Institute of British Architects, at 6.30 p.m., when Mr. G. F. Barwick, late Keeper of Printed Books at the British Museum, who is supervising the compilation of a directory of sources of specialised information, will give an address on the progress of this work. The meeting is open to all persons interested; invitation cards can be obtained from the Secretary, 38, Bloomsbury Square, London, W.C.1. In order to hasten the completion of the first edition of the directory, libraries and other organisations, firms, and individuals who have special information on any subject are invited to communicate with the editor as soon as possible.

Before the address there will be an informal discussion on "Public and Special Libraries: their spheres of service and potential relationship," to be opened by Mr. J. D. Stewart, F.L.A., and Mr. J. G. Pearce, M.I.E.E. (chairman of Council).

The Central Electricity Board.

In the House of Commons, on Tuesday last, the Minister of Transport announced that the salaries attached to positions on the Central Electricity Board were as follows:—Chairman, £7,000 a year; other members of the Board, £750 a year.

The Basle Fair.

During the past year the new permanent Fair buildings at Basle have been completed, and consequently the annual Fair, which is to be held from April 2nd to 12th, will be larger and more comprehensive than before. The groups into which the exhibits will be classified include electrical supplies; lighting, heating, and sanitation; inventions and patents; and transport. Full information regarding the Fair can be obtained from the Commercial Division, Swiss Legation, 32, Queen Anne Street, W.1.

Mining Accidents.

In a preliminary statement issued by the Mines Department of the number of deaths caused by accidents in and about the mines and quarries of Great Britain during 1926, the total number of fatal accidents is given as 707, resulting in 728 deaths. Due, of course, to the prolonged coal stoppage, the figures are very low, as compared with those for 1925, which were 1,145 and 1,233, respectively. The number of deaths for 1926 is made up as follows: 648 for the mines under the Coal Mines Act, 1911; 13 for the mines under the Metalliferous Mines Regulation Act, 1872; and 67 under the Quarries Act, 1894. Only three deaths are attributed to the use of electricity; these occurred in the coal mines, two underground and one on the surface.

A New Cable Insulation.

For use in certain situations where abnormal conditions prevail, it has been found necessary to evolve a different class of insulation for cables to that used for the ordinary rubber-insulated ones. In this connection it is interesting to learn that Messrs. W. T. Henley's Telegraph Works Co., Ltd., have produced a compound insulating material, "Henlex," which is claimed to be capable of withstanding such drastic conditions as are met with in railway work and other situations where heat and cold vary over a wide degree, and also where the conductors are subjected to deposits of condensed moisture containing sulphur, salts and acids. The new material is tough and has a high tensile strength and dielectric resistance. Cable insulated with it is capable, it is claimed, of withstanding the pressure tests prescribed by B.S.S. No. 7. A sample of "Henlex"-insulated cable was immersed in a solution of caustic soda while it was subjected to a pressure of 500 V continuously for four months. At the end of that time the cable was examined and found in as good a condition as it was before the test. As a result of this experiment a length of 3-core 0.1 sq. in. "Henlex" cable was laid along a route where another type of cable had previously to be replaced every three or four months, and where salt water is present in the ground. The cable has been recently examined *in situ* after having been in constant use for over twelve months, and found to be in perfect condition. Other samples have been immersed, under working conditions, in solutions of sulphuric, hydrochloric, and nitric acids, ammonia, caustic soda, and common salt, in no case with deterious effects. Samples have also been boiled for five hours in a 10 per cent. solution of caustic soda, and others placed between wood blocks saturated with creosote for a period of one month, in each case with equally good results.

We have received a sample of single "Henlex" insulated wire from the makers. The conductor is covered with one thick coating of the insulation, which is protected similarly to that of ordinary v.i.r. cable by means of canvas taping and outside braiding. The exterior appears to have been treated with an unusually thick wax preservative, giving the cable an enamel-like appearance.

B.T.-H. Magnetos in Speed Record.

The car in which Capt. Malcolm Campbell recently created a new world's speed record (174.883 m.p.h.) was fitted with B.T.-H. polar inductor magnetos.

Late Legal.

NEUTRON, LTD.—Mr. Justice Romer, in the Companies Winding Up Court on February 15th, made an order for the compulsory liquidation of Neutron, Ltd., makers of crystal detectors for radio apparatus, on the petition of Macrae Bros., radio manufacturers, of Ealing, W. Mr. John Beaumont, for the petitioners, said the respondent company had a capital of £500, and owed his clients £538 on an unsatisfied judgment. There were other creditors for £2,600, and there was no opposition to the petition.

ELECTRIC LIGHT & POWER CONTRACTS FINANCE CORPORATION, LTD.—Mr. Justice Romer, in the Companies Winding Up Court on February 15th, dismissed the petition of Harold Saunders, Ltd., Birmingham, for an order for the compulsory liquidation of Electric Light & Power Contracts Finance Corporation, Ltd. Counsel for the petitioners said that their debt had been satisfied, and he knew of no support for the petition. He asked for the petition to be dismissed without costs.

CLAIM FOR METERS DESTROYED BY FIRE.—In the Mayor's City of London Court, before Mr. Registrar Dell, on February 10th, the City of London Electric Lighting Co., Ltd., made a claim against Mr. A. D. Soulsky, Mitcham, for £7 15s., the cost of two meters destroyed by fire. The plaintiffs' representative said that the loss occurred in a fire which took place at the defendant's factory in December, 1925. Under the contract the defendant became responsible for the loss. There was no appearance on behalf of the defendant, and judgment was entered for the plaintiffs for the amount claimed, to be paid in 14 days.

Institution Notes.

Institution of Electrical Engineers.

At the informal meeting held on Monday, February 7th, Mr. C. Lipman was in the chair, when Mr. R. Grierson opened a discussion on "Some Interesting Features in Modern Installation Work." He said he was a keen advocate of the Institution Wiring Rules, which he felt were a decided step towards a legal standard of material and workmanship. He made suggestions for their better understanding, but some of these, it transpired, had been anticipated, notably an abridged section dealing with installation work as distinct from standards for manufacturers.

Mr. Grierson's remarks were interesting and provocative, but the time at his disposal limited the survey chiefly to installations in conduit. The problems of condensation and earthing were presented in a bold manner, which readily created a topic for the subsequent speakers. Mr. J. F. Shipley said there was a demand for a cheap three-phase switch which would isolate a motor when one phase failed; these breakers had long been in service on the Continent. Mr. H. J. Cash, describing the official tests on tumbler switches, said that while practically all five-ampere single-way switches stood up, few of the two-way survived the same tests. Mr. F. C. Raphael thought there should be a smaller switch than the common five-ampere tumbler, as 95 per cent. of switches only controlled one light. Many others took part in the discussion.

At the informal meeting on Monday, March 7th, a discussion on "Wireless as a Factor in World Communication" will be opened by Captain P. P. Eckersley.

Institution of Public Lighting Engineers.

In connection with the forthcoming annual general meeting and conference to be held at Brighton from September 12th to 15th, it is proposed to hold an exhibition of street-lighting appliances (electric, gas, or other illuminant). Firms desiring to take part should make application forthwith to Mr. A. C. Cramb (President-Elect of the Institution), Electric House, 38, High Street, Croydon, stating their requirements as to floor space and if they require a supply of gas of electricity in connection with their exhibit.

Junior Institution of Engineers.

The Institution is incorporating in its weekly series of meetings a gathering of an unusual nature on March 4th. It recently celebrated its 46th birthday, and thus many of its original members are now "Seniors" in years if not in spirit, and in order that these may demonstrate their still youthful fervour the arrangements of the special gathering have been deputed to Mr. Walter T. Dunn, secretary for the first 27 years of the Institution's history, and a few other veterans. The exact nature of the programme has not been divulged, but in view of the prominent positions which many early "Juniors" now occupy in the profession, some interesting engineering and other experiences may be looked forward to.

On February 11th, Prof. K. Neville Moss, O.A.E., M.Sc. (honorary member) delivered a lecture to the Institution on the subject of "Physiology of Work Under High-Temperature Conditions." Referring in particular to experimental work carried out by himself in the mining industry, Prof. Moss described the effect of food, liquid, and air on the work done by a man, and explained for the purposes of his lecture the functions of respiration, metabolism, temperature regulation of the body, and sweating.

Institute of Transport.

EXAMINATIONS.—The Council of the Institute announces that examinations will be held in London and certain provincial centres on April 28th, 29th, and 30th, 1927. The last date for the receipt of applications is March 1st, and requests for the requisite forms should be addressed to the Secretary, 15, Savoy Street, Victoria Embankment, W.C.2.

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.

Mr. C. C. N. WALLICH, who until recently was station director at Plymouth for the British Broadcasting Company, has been appointed station director at Calcutta under the Indian Broadcasting Company, and will sail on March 4th. The Calcutta position is the senior station directorship of the Indian Company.

Mr. L. B. PAGE, of the Hull station, has been appointed station director of the Bombay station. He is also sailing for India on March 4th.

The Times contains the announcement of an engagement between Mr. JOHN MARRYAT, elder son of Mr. and Mrs. Howard Marryat, of 1, The Terrace, Richmond, and Miss MARIANNA AMY (Maisie), only daughter of Sir Edmund Nott-Bower, K.C.B., and the late Lady Nott-Bower, of Kelston, Richmond, Surrey.

The Prestatyn Urban Council has appointed Mr. W. R. KELLEY, of Lincoln, to the position of electrical engineer to the Council. There were 140 applications. Mr. Kelley is assistant mains engineer to the Lincoln Corporation.

Major F. H. MASTERS has relinquished the position of editor of the *Electrician* which he has held since 1919, and has joined the editorial staff of our contemporary *Engineering*.

The Manchester Corporation has appointed Mr. W. H DUNCAN, A.M.I.E.E., as mains engineer. Mr. Duncan joined the mains department staff of the Newcastle Electric Supply and Allied Companies in 1906, and since that date he has been associated with Mr. Charles Vernier (now chief engineer to the Macintosh Cable Co.) as a chief assistant mains engineer. Mr. Duncan, under Mr. Vernier, was in charge of the installation and subsequent maintenance of the first 3-core 20,000-volt cables laid in the world, and was also connected with the laying down of the Newcastle Electric Supply Company's extensive system of 20,000-volt overhead lines, and 6,000-volt and l.p. distribution networks. In 1917 he was appointed sectional mains engineer in charge of the Cleveland and Durham County Electric Power Company's system, which covers an area of 840 square miles. Since 1922 he has been closely connected with the installation of the first 66,000-volt underground and overhead transmission lines in this country.

Mr. C. L. DOUTHWAITE, late of W. T. Henley's Telegraph Works Co., Ltd., has been appointed manager of the joint Leeds branch of the London Electric Wire Co. & Smiths, Ltd., and the Liverpool Electric Cable Co., Ltd. He took up his duties on February 14th.

Fulham Borough Council electricity department recommends that Mr. E. T. HOWELL, of Tunbridge Wells, be appointed mains assistant.

The B.B.C. recently received a cable from Union Radio Station, Madrid, stating that Mr. LEE DE FOREST, who is in Europe, would address all European wireless transmitters on February 11th through E.A.J.7, Union Radio Madrid.

Mr. A. HILL, from the Western Point power station of the Salt Union, Ltd., has been appointed to the position of shift charge engineer to the United Alkali Co., Ltd., Widnes, recently advertised.

A presentation was made on January 29th to Mr. E. J. EDGAR on behalf of the staff and employés of the Belfast Corporation Electricity Department, at a smoking concert, by Mr. Johnstone Wright, the engineer and manager. Mr. Edgar has been appointed assistant executive engineer of generation to the Electricity Department of the Shanghai Municipal Council, and has been up to the present resident engineer at the Harbour power station, Belfast.

Obituary.—SIR JAMES KEMNAL.—The death of Sir James Kemnal, which was briefly reported in our last issue, occurred on February 8th at Sandbanks, Dorset. He had been ill since last September, and was in his 63rd year. He was born in London, a son of Mr. James Rosenthal, by which name he was known to electrical engineers for many years until he adopted that of Kemnal. His great interest in life was

the business of Babcock & Wilcox, Ltd., of which he was managing director. In addition to his connection with the British company of that name, he was a director of all the foreign B. & W. companies, also of Balfour, Beatty & Co., the Power Securities Corporation, the Power and Traction Finance Company (Poland), Ltd., and Worthington-Simpson, Ltd. He took a leading interest in matters relating to trade development in South America as president of the British and Latin-American Chamber of Commerce.

DR. J. R. ERSKINE-MURRAY.—We learn with feelings of deep regret of the death which occurred on February 12th, at Portsmouth, after a very short illness, of Dr. James Robert Erskine-Murray, F.R.S., the well-known authority on wireless telegraphy. He was 58 years of age. The funeral is to take place at Edinburgh to-day, Friday. We shall refer to Dr. Erskine-Murray's work more fully in our next issue.

HERR R. A. KOECHLIN-HOFFMANN.—The death is reported from Basle, at the age of 67 years, of Herr R. A. Koechlin-Hoffmann, president of the Swiss Co. for Electrical Industry.

MR. A. HANKINSON.—We regret to record the death, which occurred on January 24th, at Sydney, N.S.W., of Mr. Alfred Hankinson, aged 68. He entered the service of Messrs. Rd. Johnson, Clapham & Morris, Ltd., in 1875, and after being in their Manchester office for about 16 years, he went to Australia for reasons of health. In the early part of 1893, while on a visit to England, he arranged to open an office in Melbourne for his company, and owing to the success of this venture, offices were opened in Sydney, Brisbane, and Wellington (N.Z.). Mr. Hankinson was general manager of the Australian business of the company up to the time of his death, and in the course of his duties paid several visits to this country, being here as recently as last spring.

MR. T. W. BROADBENT.—We regret to record the death of Mr. Thomas William Broadbent, which, according to a Leeds paper, occurred on February 7th at his residence, Hillside House, Kirkheaton, near Huddersfield. Mr. Broadbent, who was 53 years of age, was the founder of the business of T. W. Broadbent, manufacturing electrical engineers, of Huddersfield, and he is described as the pioneer of electricity supply in a number of villages in the district. The business of T. W. Broadbent, Ltd., of which he was chairman and senior director, is being continued under the same style.

MR. T. F. DAVIES.—The death is announced of Mr. T. F. Davies, aged 34, of Laneside, Accrington, for several years electrical engineer to the Altham Colliery Co.

MR. W. H. DAVIES.—We record with regret the death, which occurred on January 26th, from pneumonia, of Mr. W. H. Davies, of Amersham, Bucks., representative of Messrs. Pritchett & Gold and E.P.S. Co., Ltd. He was district representative of the company for Northants., Bedford, Herts., Bucks., and Oxfordshire.

Will.—Mr. C. J. LEYLAND, a director of Parsons Marine Steam Turbine Co. and other companies, left £2,147 net personalty and £2,221 gross.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Carnegie & Watson, Ltd.—Private company. Registered in Edinburgh, February 9th. Capital £10,000 in 3,500 preference and 6,500 ordinary shares of £1 each. Objects: To acquire the business of Carnegie & Watson, motor and electrical engineers, 21, Mounthooly, Aberdeen. The first directors are:—A. H. Watson, 8, Seaforth Road, Aberdeen, engineer; Mrs. E. Carnegie, 28, Markland Road East, Aberdeen; W. Johnstone, 2, Strawberry Bank, Aberdeen, accountant. Secretary: W. Johnston. Registered office: 75, Spring Gardens, Aberdeen.

I. Kasha & Son, Ltd.—Private company. Registered February 4th. Capital £2,000 in £1 shares. Objects: To adopt an agreement with I. Kasha and L. Kasha, and to carry on the business of lamp shade manufacturers and metal workers formerly carried on by them as I. Kasha & Son, at Broadway Chambers, Hammersmith, W.6. The subscribers (each with one share) are:—I. Kasha, Broadway Chambers, Hammersmith, W.6; manufacturer; H. E. Needham, Broadway Chambers, Hammersmith, W.6, accountant. The first directors are to be appointed by the subscribers. Qualification, £100. Solicitors: H. R. Lamonby, 6, Portland Place, W.1.

N. Russell & Co., Ltd.—Private company. Registered in Edinburgh, February 8th. Capital, £2,000 in £1 shares. Objects: To carry on the business of electricians, mechanical, motor and general engineers, &c. The subscribers (each with one share) are:—N. Russell, 421, Great Western Road, Glasgow, electrical engineer; Alex. A. M. Turnbull, Great Western Road, Glasgow, electrical engineer. The first directors are not named. Qualification, one share. Registered office: 471, Great Western Road, Glasgow.

A. E. Ball & Co., Ltd.—Private company. Registered February 10th. Capital, £1,100 in 700 shares of £1 each and 800 shares of 10s. each. Objects: To carry on the business of radio and electrical engineers and manufacturers of and dealers in wireless apparatus and appliances, &c. The first directors are:—A. E. Ball, 125, Muswell Hill Road, N.10; J. B. Hobson, 19, Rokesley Avenue, N.8; Edith E. Ball, 125, Muswell Hill Road, N.10; Sarah C. Hobson, 19, Rokesley Avenue, N.8. Solicitors: Ernest W. Long & Co., 27, Lincoln's Inn Fields, W.C. Registered office: 10, Woodhouse Parade, North Finchley, N.12.

Peter Raven & Co., Ltd.—Private company. Registered February 9th. Capital, £3,000 in £1 shares (1,500 founders' and 1,500 ordinary). Objects: To acquire the business of an exporter and importer of and dealer in electrical and general engineering accessories, &c., carried on by J. Greenway, at 3, Stafford Street, Birmingham, as "Peter Raven & Co.," and to carry on this and the business of manufacturers of motors, wireless, and other appliances, &c. The permanent directors are:—J. Greenway, 3, Stafford Street, Birmingham, manufacturers' agent (chairman); T. E. Norton, 35, Russell Terrace, Leamington Spa, manufacturer. Qualification, £50. Solicitors: Orton & Son, Coventry.

King, Stringer & Co., Ltd.—Private company. Registered February 10th. Capital, £5,000 in £1 shares. Objects: To carry on the business of electrical, mechanical, and general engineers, electricians, suppliers of electricity for light, heat, power or otherwise, manufacturers of and dealers in wireless apparatus, &c. The permanent directors are:—A. C. King, 31, Somali Road, N.W.2, electrical engineer; J. S. Stringer, 21, Titchborne Street, W.2, dispatch superintendent; C. G. Hey, 104, Cromwell Road, S.W.7, consulting surgeon. Qualification, £50.

MacLean & Robb, Ltd.—Private company. Registered in Edinburgh, February 9th. Capital, £1,500 in £1 shares. Objects: To acquire the business of MacLean & Robb, plumbers and electricians, in Glasgow. The directors are:—E. MacLean, 496, Maryhill Road, Glasgow, plumber and electrician; A. Robb, 496, Maryhill Road, Glasgow, plumber and electrician. Qualification, £100 shares. Solicitor: T. Hay, 113, West Regent Street, Glasgow.

Stelmar Projection Lighting, Ltd.—Private company. Registered February 5th. Capital £5,000, in £1 shares. Objects: To adopt an agreement with L. J. Steele and H. Martin for the acquisition of patents relating to projection lighting, and to carry on the business of engineers, &c. The first directors are:—L. R. Moorshead, 78, St. George's Square, S.W.1, engineer; S. H. Rawlings, Devon Lodge, Clacton-on-Sea, engineer; C. S. Golding, 30, Julian Road, Folkestone, solicitor. Qualification, £20. Remuneration, £25 each per annum. Secretary: R. C. Palmer. Solicitors: Golding, Hargrove & Golding, 99, Cannon Street, E.C.4. Registered office: 99, Cannon Street, E.C.4.

Charles Mickleburgh, Ltd.—Private company. Registered February 5th. Capital £100, in £1 shares. Objects: To acquire the business of an electrical, gas, mechanical, and power engineer carried on by C. Mickleburgh, of 2, Woodfield Crescent, Paddington, W.9. The subscribers are:—C. Mickleburgh, Ivydene, 13, Portland Villas, Hove, engineer (retired), 99 shares; Miss D. M. Mickleburgh, 2, Woodfield Crescent, Paddington, W., 1 share. The first directors are to be appointed by the subscribers. Secretary: Miss D. M. Mickleburgh. Solicitor: N. Holman Boyns, 478, Harrow Road, W.9. Registered office: 2, Woodfield Crescent, Paddington, W.9.

Evalasio Distributing Agency, Ltd.—Private company. Registered February 5th. Capital £100, in £1 shares. Objects: To acquire the business of wholesale and retail wireless and motor accessory distributors heretofore carried on by E. F. Keal and W. H. Stevens as the "Evalasio Distributing Agency." The subscribers (each with one share) are:—Enid M. Horwood, 11, Heston Park Road, Heston, Hounslow, clerk; L. W. Parkin, 21, Albert Square, S.W.8, clerk. The directors are: E. F. Keal, W. H. Stevens, H. G. Evans, and G. H. R. Clements. Qualification, 25 shares. Remuneration, £10 each per annum (chairman £5 extra). Solicitor: W. H. Lane, 27, Chancery Lane, W.C.

Welwyn Wireless, Ltd.—Private company. Registered February 14th. Capital, £500 in £1 shares. Objects: To carry on at Codicote, Welwyn, Herts., and elsewhere, the business of wireless and general electrical engineers and manufacturers, &c. The permanent directors are:—E. H. Collingwood (managing director), Codicote, Welwyn, Herts., engineer; H. G. Cherry, Digswell, Welwyn, Herts., architect. Qualification, 10 shares. Solicitors: Rivington & Son, 1, Fenchurch Buildings, E.C.3. Registered office: High Street, Codicote, Herts.

J. T. Kemp, Ltd.—Private company. Registered February 10th. Capital, £6,000 in £1 shares. Objects:—To acquire the business of a manufacturer of and dealer in electrical equipment and appliances carried on by J. T. Kemp at 13, Derby Road, Nottingham, as "J. T. Kemp." The directors are:—J. T. Kemp, 15, Rolleston Drive, Nottingham; G. H. Hooke, 28, Florence Road, West Bridgford, Notts (both permanent managing directors, subject to each holding 1,000 shares). Solicitors: Huntsman & Donaldson, 1, Bridlesmith Gate, Nottingham. Registered office: 13, Derby Road, Nottingham.

Official Returns of Electrical Companies.

Horley and District Electricity Supply Co., Ltd.—Particulars filed of £5,000 debentures authorised December 30th, 1926, charged on the company's general assets, but excluding freehold office in Victoria Road, Horley, &c., the amount of the present issue being £2,500.

H. Lewis, Ltd.—Mortgage dated January 21st, 1927, to secure £1,000, charged on 4 & 5, North Street, Wisbech. Also debenture dated January 22nd, 1927, to secure £400, charged on the company's property, present and future, including uncalled capital. Holder: C. Saunders, "Ford," Norton Fitz-Warren, Somerset.

Barbados Electric Supply Corporation, Ltd.—Capital, £60,000 in 40,000 preferred and participating, and 20,000 ordinary shares of £1 each. Return dated December 17th, 1926. 35,172 preferred and 20,000 ordinary shares taken up. £34,672 paid on 34,672 preferred shares. £20,500 considered as paid on 500 preferred and 20,000 ordinary shares. Mortgages and charges, £19,000.

Reed, Evans & Co., Ltd. — Capital, £100,000 in £1 shares. Return dated December 31st, 1926. 92,292 shares taken up. £6,576 paid (being £1 per share on 657 and 4s. per share on 29,595 shares). £85,716 considered as paid (being £1 per share on 62,040 and 16s. per share on 29,595 shares). Mortgages and charges, nil.

Ejecta Valve Co., Ltd. — Capital, £5,000 in 3,000 ordinary and 2,000 participating preference shares of £1 each. Return dated December 31st, 1925 (filed January 20th, 1927). 360 preference and 2,008 ordinary shares taken up. £2,368 paid. Mortgages and charges, nil.

Atkins & Wallis, Ltd.—W. H. Clegg, of 31, Twyford Street, Caledonian Road, N.1, was appointed receiver and manager on January 21st, 1927, under powers contained in debentures dated February 26th, 1926.

Castle Fuse and Engineering Co., Ltd.—Satisfaction in full on January 25th, 1927, of charge on 72, Haigh Street, Liverpool, dated November 22nd, 1926, securing account current.

V. G. Middleton & Co., Ltd.—Satisfaction to the extent of £600 on December 31st, 1926, of debentures dated April 29th, 1920, securing £4,000.

British Di-Electric Co., Ltd.—Issue on January 17th, 1927, of £250 debentures, part of a series.

Pyramid Products, Ltd.—Particulars filed of £500 debentures authorised February 2nd, 1927, charged on the company's property, present and future, including uncalled capital, the whole amount being now issued.

Pickvance, Ltd.—Issue on January 31st, 1927, of £100 debentures, part of a second series already registered.

City Notes.

Metropolitan Railway Co.

The report for the year ended December 31st last records a gross revenue of £1,701,828 and a net income of £714,529. To the latter sum are added £51,402 brought forward, £50,000 from the general reserve towards the increased cost of coal and other expenses due to the coal stoppage, and £50,000 from provision made for income tax and not required for that purpose, making a total of £865,931. The balance available for ordinary dividend is £249,571. It is proposed to pay a final dividend of £1 10s. per cent. on the ordinary stock, making £3 per cent. for the year (as against £5 per cent. for 1925), leaving £22,211 to be carried forward. The Surplus Lands Stock dividend is £3 12s. 6d. per cent. for the year, as against £3 10s. per cent. In announcing the reduced dividend, the directors point out that, apart from the fact that 1926 was a difficult year, 1924 and 1925 were exceptional years on account of the revenue from the British Empire Exhibition traffic. The reconstruction of the Aldgate and Edgware Road stations was completed so far as the permanent way and platforms were concerned. In the case of the latter station, a contract has been let for new buildings on the street level. The company's Act authorising the construction of a relief line connecting the Harrow extension line with the Circle line was passed in August last. During the year one of the 5,000-kW turbo-generators at the Neasden power station was replaced by a 15,000-kW set with resulting economy. The report records the death of Mr. J. W. Wheeler-Bennett and the appointment to the board of Sir Edward Manville. The meeting was to be held yesterday (Thursday).

German Companies.

The report of the *Allgemeine Elektricitäts Gesellschaft* for the year ended September 30th, 1926, states that activity increased, and appeared to be a steady improvement. The "rationalisation" of working in various industries must have a favourable influence on the electrical industry. The year was entered upon with such a large stock of orders that it was possible to keep the works active at about 75 per cent. of their capacity. A favourable development of the inland business was probably to be expected from the rapidly growing purchasing power in the home market, the progressive electrification of industrial works, and the revival in the building trades. On the other hand, the foreign business continued to suffer from the new competition, and from the effects of the currency depreciation in France and Italy. The adaptation of the turbine works to the production of new types was carried out. The deliveries of steam turbines, turbo-generators, and allied machines were nearly double those of the previous year, but discretion was exercised in accepting new orders, as the prices obtainable were not always satisfactory. The orders in the turbine works represented a total of 600,000 kW. A main line electric locomotive was delivered to the Reich Railway Company, and other electric locomotives for the mountain sections in Silesia and Bavaria had proved satisfactory. The tramway department was well occupied. Important orders were received for driving motors and other equipment in connection with the decision of the Reich railway to electrify about 100 miles of the Berlin and suburban lines. Orders for generators of large and small output for hydro-electric works were received, and the production of l.p. cables was further improved. Large orders were received from the coal industry. It is considered that Germany is still only at the beginning of the consumption of electrical energy; a reduction in the price is necessary to secure a large increase in consumption. As previously reported, the net profits were 10,760,000 marks, as compared with 8,360,000 marks in 1924-25. It is proposed to pay 6 and 5 per cent. on the two classes of preference shares respectively, and 7 per cent. on the ordinary capital, the latter comparing with 6 per cent. in the previous year, leaving 465,000 marks to be carried forward.

The directors of the *Siemens and Halske Company* report gross profits of 16,120,000 marks for 1925-26, as against 9,590,000 marks in the previous year. After defraying general expenses, &c., there is a net profit of 15,350,000 marks, as compared with 8,890,000 marks in 1924-25. It is proposed to increase the rate of dividend from 6 per cent. to 10 per cent.

The *Siemens-Schuckert Works Company* earned gross profits of 13,360,000 marks, and the net profit is 12,170,000 marks, as against 8,950,000 marks; the dividend is 8½ per cent., as compared with 6 per cent. in 1924-25.

Stock Exchange Notices.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

North Metropolitan Power Station Co., Ltd.—£850,000 5 per cent. guaranteed debenture stock, 1957, issued at 100½ per cent., partly paid and fully paid.

Metropolitan Electric Supply Co., Ltd.—500,000 ordinary shares of £1 each, fully paid, Nos. 1,000,001 to 1,500,000.

Shawinigan Water and Power.—1,027,184 shares of no par value.

West Gloucestershire Power—£30,000 6½ per cent. participating preference stock.

The undermentioned have been ordered to be officially quoted:—

Shawinigan Water and Power Co.—1,027,184 shares of common stock of no par value.

Telephone Manufacturing Co., Ltd.—1,590,000 ordinary shares of 10s. each, fully paid, Nos. 410,001 to 2,000,000.

West Gloucestershire Power Co., Ltd.—£30,000 6½ per cent. participating preference stock.

The "Underground" Group.

Last week the companies forming this combine declared their final dividends for the past year. The total dividends are similar to those distributed in the preceding year, and the amounts transferred to reserve are also the same. The dividends are as follows:—

Metropolitan District Railway Co.—Ordinary stock: 2 per cent., making 3½ per cent. for the year. To reserve, £45,000.

London Electric Railway Co.—Consolidated ordinary stock: 1¾ per cent., making 3½ per cent. for the year. To reserve, £45,000.

City and South London Railway Co.—Consolidated ordinary stock: 1½ per cent., making 3 per cent. for the year. To reserve, £25,000.

Central London Railway Co.—Undivided ordinary stock and preferred stock: 2 per cent., making 4 per cent. for the year. Deferred stock: 4 per cent. (for the year). To reserve, £40,000.

Underground Electric Railways Co. of London, Ltd.—After making the full distribution upon its 6 per cent. first cumulative income debenture stock and 6 per cent. (free of tax) income bonds, this company proposes to pay 1½ per cent. upon its ordinary shares, the first distribution made upon these since the company's formation.

Westinghouse Brake and Saxby Signal Co., Ltd.

Lord Southborough (chairman), presiding at the recent annual meeting, said that in spite of difficulties engendered by the coal dispute they had managed to keep their works running. Several important contracts had been carried out during the year, including the apparatus for an electro-pneumatic signalling system at the Plaza Constitucional terminus of the Buenos Aires Great Southern Railway; and power signalling apparatus for the Charing Cross and Cannon Street stations of the Southern Railway. In the face of strong foreign competition they had been awarded the contract for the electrically-operated power-signalling installation at Cape Town and the provision of automatic signalling between Cape Town and Wynberg. Their associated company in India had received an equally important contract.

Singapore Traction Co., Ltd.

The first annual meeting was held on February 9th. Mr. L. W. Hawkins, the chairman, in presenting the report, said that the balance-sheet showed a strong financial position; it was believed that the cash in hand and British Government securities would be ample to finance the completion of the change-over to railless traction and certain extensions which might be found desirable. The directors did not regard it desirable to pay a dividend for the first year, even though the preference dividend was cumulative, as during the period of transition the current year's profits would be lower than those of the year under review. The report and accounts were adopted.

Chiswick Electricity Supply Corporation, Ltd.

The accounts for 1926 show a total revenue of £75,309, as against £73.804 in 1925. After providing £8,000 for depreciation there is a net profit of £19.852, to which is added £1,086 brought forward, making £20,938. It is proposed to pay a final dividend of 11 per cent., making 16 per cent. for the year (as compared with 15 per cent. for 1925); to refund £4,140 to consumers; to place £1,000 to general reserve; and to carry forward £1,658. The capital expenditure during the year was £11,865. The meeting was to be held yesterday (Thursday).

City of Buenos Aires Tramways (1904), Ltd.

The balance at credit of net revenue for 1926 was £82,614. It is proposed to pay a final dividend of 1s. 3d. per share (making 5s. per share, 5 per cent., for the year). The amortisation and general fund receives £5,500, and £15,114 is carried forward. Reference is made in the report to the adverse decision of Mr. Justice Rowlatt with regard to the payment of corporation profits tax by the company, and it is stated that the balance carried forward should more than cover the company's liability in this respect.

Companies to be Struck off the Register.

The names of the undermentioned companies will be struck off the Register at the expiration of three months, unless cause is shown to the contrary:—

Adnil Electric Co., Ltd.
"Cedes" Electric Traction, Ltd.
Electrical Industries, Ltd.
Leitner Electrical Co., Ltd.
Maxim Lamp Works, Ltd.
Portable Electric Motors (1919), Ltd.

Tyneside Tramways and Tramroads Co.

The report for the half-year to December 31st last records a surplus of receipts over expenses of £550. To this are added £914 brought forward and £500 from the special reserve, making £1,964. After deducting loan interest, &c., there remains £79. For the whole year there was a decrease of £6,520 in the traffic receipts, mainly due to the coal stoppage. The number of passengers carried fell from 7,230,581 to 6,167,679.

Power Securities Corporation, Ltd.

The report for 1926 shows a gross income of £99,905 and a net profit of £78,008. To the latter amount was added £12,944 brought forward, making £90,952. The directors propose to transfer £20,000 to reserve and to pay a dividend of 6½ per cent. on the ordinary shares (as in 1925), leaving £16,952 to be carried forward. The market value of investments is said to be in excess of the balance-sheet value.

North Metropolitan Electric Power Supply Co.

The directors recommend the payment of a dividend on the ordinary shares at the rate of 10 per cent. per annum, as last year. The reserve has been credited with £100,000 out of revenue, and £55,620, representing the premium on shares issued during the year, compared with £150,000 in the previous year.

Quebec Power Co.

The dividend on the common shares for the quarter ending March 31st has been raised to 1¾ per cent. (against 1½ per cent.), thus placing the shares on a 7 per cent. basis. Present holders are to be offered 23,784 new common shares (making $10,000,000) on the basis of three new shares for each 10 held.

Pennsylvania Water and Power Co.

The total revenue for 1926 was $3,103,673, and the amount available $1,424,626. After meeting interest, a total dividend of 8 per cent., depreciation ($230,052), and sinking fund, and contingent fund ($200,000), a balance of $34,877 is carried forward.

Electrical and Industrial Investment Co., Ltd.

The profit for 1926 was £21,635 (against £17,300), and to it is added £31,490 brought forward, making £53,125. After meeting the preference and preferred ordinary dividends a dividend of 9d. per share (75 per cent.) is declared on the deferred shares, and £36,750 is carried forward.

Montreal Light, Heat and Power Consolidated.

The report for 1926 shows a gross revenue of $18,907,382 and a net revenue, less fixed charges, of $7,082,567. Dividends absorbed $5,135,041, and $1,869,482 has been transferred to capital and surplus account. Reference is made in the report to the re-arrangement of capital made during the year.

Laurentide Power Co.

The report for 1926 shows a total revenue of $1,483,747 and an available balance (including the amount brought forward) of $730,344. Dividends totalling 5 per cent. have been paid and $100,000 is allocated to depreciation.

Uxbridge and District Electric Supply Co., Ltd.

It is proposed to pay a dividend of 8 per cent. on the ordinary shares for 1926, as for the previous year. £15,000 is put to depreciation fund, and £1,824 is carried forward.

London and Suburban Traction Co., Ltd.

The directors announce that they are unable to recommend the payment of the dividend on the 5 per cent. cumulative preference shares.

Armstrong, Whitworth Scheme Sanctioned.

In the Chancery Division last week, Mr. Justice Romer sanctioned the scheme of arrangement prepared by the board of Sir W. G. Armstrong, Whitworth & Co., Ltd.

Submarine Cables Trust.

The trustees announce that they have decided to distribute the trust funds among holders of coupons of reversion at the rate of £153 2s. 6d. per coupon.

Stocks and Shares.

Monday Evening.

The Home Railway dividends make an interesting feature in Stock Exchange markets that are, generally speaking, firm and active. No cessation is noticeable in the stream of capital which flows steadily into Stock Exchange securities. All the good stock finds a ready welcome. The new North Metropolitan Power Station fives, offered under the Trade Facilities Acts, and at the high price of 100½, were quoted at a discount when dealings started, but the scrip was quickly absorbed, and the price hardened to a small premium.

The Underground Railways of London has provided the pleasantest disappointment of the present Home Railway dividends, the company declaring a "maiden" of 1½ per cent. on its £1 shares. The District has done very well, maintaining its previous 3½ per cent. for the year. Similar dividends to those of 1925 are the London Electric's 3½ per cent., City and South London's 3 per cent., and Central London's 4 per cent. on the deferred, these all being for the full twelve months of

1926. The London General Omnibus dividend of 3 per cent., tax free, makes 6 per cent., tax free, for the year. The Associated Equipment will pay 8 per cent., tax free, on the ordinary, as against nil. These are good results, especially in view of the heavy cuts in their dividend rates made by the Great Western, "Brum," and Southern Railways. Districts have risen 3 to 58, Undergrounds ⅛ to 14s., and the income bonds to 104. Central Londons have put on a point, at 71.

Metropolitan consolidated, like Districts, also boasts a gain of 3, the price strengthening to 64½. The report for 1926 showed the receipts to be nearly £300,000 down, while expenses were reduced by £34,000. To pay 3 per cent. (as against 5 per cent. the year before) the Metropolitan has to take £100,000 from reserve and to carry forward £22,211, some £29,000 less than that in February, 1926.

There is a touch of quaint irony in the fact of 3 per cent. being paid for last year by the Great Western, London, Midland, Scottish, and the Metropolitan, the prices of which stand at 86, 76, and 64½, respectively; while Districts, upon which the company has paid 3½ per cent. out of its real earnings for the year, are quoted at 58. It need hardly be added that in the case of the first-named trio it is taken for granted that future results are not likely to be anything like so bad as the depressing dividends declared in respect of the general strike and the coal stoppage year. The whole of the Home Railway market has adopted a more cheery aspect than of late, on the assumption that, with the worst known, any change must be for the better. This consideration served to bring in a few buyers and to impart an all-round firmness to prices.

Mexicans have not repeated their dramatic advances of a week back, when the Light and Power Company's preferred gained 12 and the common 8½ points, but the prices are maintained, and the first mortgage bonds have put on 3. The seconds are higher at 89½; Mexico Trams have risen to 20½, and the 5 per cent. bonds to 67. Sidros have come into renewed demand, and are up to 14½. Brazilian Tractions jumped a further 4 points to 122. Barcelona Trams are higher at 43½. Amongst other dollar stocks, Shawinigans weakened a trifle; Montreal and Pennsylvania shares have gone ahead.

British Columbia deferred at 162½ is 4 higher, following its rise of 4½ last week. The preferred at 126½ is 2 better. Anglo-Argentine Tramways first and second preference have gone up 2s. 6d. to 3, at which price the seconds yield 10 per cent. on the money. The 5 per cent. debenture, which is quite a reasonable second-class investment, returns 7 per cent. at its enhanced quotation of 71½. Movements such as those mentioned in this and the preceding paragraph point plainly to the present-day demand for speculative investment and frankly speculative issues. It will be said, of course, that, in nearly all the stocks and shares enumerated, the markets are limited, and that, in consequence, a demand will cause movements disproportionate to the orders causing them. This is a just argument, but prices would not be put up so vigorously if there were not a pressing public demand for the stocks.

London and Suburban Traction preference are unchanged at 6s. 6d., the passing of the dividend causing no great surprise. Nothing has been paid on these since March, 1924. London United Tramways 4 per cent. debenture holds its price at 45½. British Electric Tractions have not altered.

Electricity supply shares are a quiet market. County ordinary at 28s. 6d. have gained another sixpence. The company's scheme for exchanging £100 first debenture and £100 second debenture for £115 and £112 new 4 per cent. Consols, respectively, goes before the stockholders' meetings on the Thursday in this week. Proprietors have the option of assenting or not, but there are sound reasons why they should effect a conversion that ought to turn out profitably for them. Idle speculation may intrigue its imagination with the possibility of the company making some new issue of its own after the debenture scheme is out of the way; no rumour of such a thing has been mentioned in the market.

Kensingtons are better at 24s. 6d., and Urbans rose to the same price. In the provincial list, Newcastle-on-Tyne ordinary at 21s. 3d. are 9d. better, and Yorkshire Electrics show 1s. gain at 29s. On the other hand, Yorkshire (West Riding) Trams are flat at 8s. 9d.

On the death of the Babcock & Wilcox managing director, Sir James Kemnal, the price of the shares dropped from 53s. 9d. to 52s., rallying later to 52s. 6d. The fall in the price is an eloquent testimonial to the faith which Babcock shareholders reposed in his remarkable powers. Very few changes have occurred in the list of manufacturing companies' shares. Enfields are a shade better at 75s. Automatic Telephones eased off to 53s. 9d. International Telephones are 44s. 6d., and the "B" shares 42s. Any declines in prices that occur, and for which no explanation is obvious, are nowadays attributed to the effect of sales by people who want to realise money for the purpose of putting the cash into the oil market, where a lively boomlet was in progress until reaction overtook the market to-day (Monday).

Nothing of importance is occurring amongst cable stocks and shares, where the disposition is somewhat dull. Great Northerns make an exception with a 5s. rise to 26¾. Marconis revolve narrowly around 15s., and Canadian Marconis keep about 3s. 6d. Rubber shares are quiet. Vickers had a crisp rise, and other issues in this group are better, upon trade prospects.

The Electrical Imports of Peru.

THE following figures show the values of the imports into Peru of electrical goods and apparatus in 1925. Comparative figures for 1924 are also given, together with a note of increases or decreases. The Peruvian £ = about 20s.

	1924. £P	1925. £P	Inc. or dec. £P
Electrical accessories, e.g., switches, cutouts, plugs, lampholders—			
Total	37,000	33,000	− 4,000
From Germany	16,000	22,000	+ 6,000

Machinery Imports of the Belgian Congo.

THE following figures, showing the imports of electrical and industrial machinery into the Belgian Congo in 1925, are taken from the recently issued official statistics. The figures for 1924 are added for purposes of comparison and notes of any increases or decreases are given. It will be noticed that some very remarkable increases are shown.

Electrical machinery and apparatus.—

High-pressure Cable Practice.

An interesting paper, "Super Tension Cable Dielectrics," was recently read before the Engineering Society of University College, Southampton, by Mr. A. I. Tracey, A.M.I.E.E. The lecturer dealt with the necessity of keeping the size of high-voltage cables down to practical limitations and thereby subjecting the dielectrics to much higher relative stresses than had previously been the practice. Foreign matter in a highly-stressed dielectric, he said, had a cumulative effect which finally caused breakdown, either by the particle expanding or piercing it, or by starting a rise in temperature and causing breakdown in that manner. Several kinds of extra-high-pressure cables now in use were described and their relative merits compared.

The British Industries Fair.—I.

Exhibits at London and Birmingham.

ON Monday next, simultaneously in London and Birmingham, there opens what can be claimed to be the largest trade exhibition ever held in this country. This year's British Industries Fair eclipses all its predecessors in size and variety, and this is especially true of the electrical section at Birmingham, which is now thoroughly representative of the industry. The accompanying illustration (fig. 1) presents a view of the extensions which have been made to the Castle Bromwich buildings to cope with the greatly enhanced demand for more space by the electrical manufacturers. The extensions to this and the Hardware Section represent an additional floor space of 120,000 sq. ft.

Fig. 1.—Building Extensions at Castle Bromwich, Birmingham.

While the exhibition is not primarily intended for the introduction of novelties, being a demonstration of the staple products of British manufacturers, there are a number of inventions and devices which are making their first appearance.

The Fair is a means of demonstrating to buyers from foreign countries and the Dominions the capabilities of British industry, and it certainly does this in a very effective way. A strictly businesslike atmosphere prevails, and the public is only admitted on certain days and at certain times. Therefore a buyer who wishes to discuss business can do so unhampered by a crowd of mere sightseers. While the main object in view is the export market, the importance of the home buyer is not overlooked. Practically every day of the exhibition will be marked by visits of representative trade associations whose members are responsible for a large proportion of the home demand for all kinds of products. These Associations, while mainly attracted by the sections dealing with their own particular requirements, are put into touch with other sections, often to their mutual benefit. For instance, it will be seen from the official programme which we reproduce below that a number of Associations whose attendance should interest electrical exhibitors are paying official visits. We may mention in this connection the export merchants' organisations, and the ironmongers' and hardwaremen's associations. We consider that it will be worth the while of any of our readers to pay a visit to the show, and would remind them that a card of admission to the Birmingham Fair, combined with a voucher for reduced railway fares, was circulated with each copy of the ELECTRICAL REVIEW of December 31st last. Readers who have mislaid their cards can have others if they will apply to us. We commence below some notes upon this year's functions and exhibits; in both directions considerable improvement and extension is indicated.

THE BIRMINGHAM SECTION.

Official Birmingham Programme.

The following is the official programme of functions for the Birmingham section :—

February 21st.—Official opening by the Lord Mayor of Birmingham.

February 22nd.—Visit of the Prince of Wales; Sir Philip Cunliffe-Lister, K.B.E. (President of the Board of Trade); Lord Mayors, Lord Provosts, Mayors, Provosts and Town Clerks of other industrial towns; Birmingham Association of Building Trades Employers.

February 23rd.—Birmingham Consular Association; British Export Society, London Export Merchants; Birmingham Export Merchants; Manchester Export Merchants; Liverpool Export Merchants; Sheffield Export Merchants; Metal Thread Screw Manufacturers' Association; National Hardware Association.

February 24th.—Visit of the Prime Minister.

February 25th.—Association of Consulting Engineers; Association of Mining Electrical Engineers; Incorporated Association of Electric Power Companies; Institution of Electrical Engineers; Municipal Tramways and Transport Association; Tramways and Light Railways Association.

February 26th.—Electrical Power Engineers' Association; Meter Engineers' Technical Association; National Association of Supervising Electricians; Birmingham and District Association of the Institution of Civil Engineers; Institution of Electrical Engineers (Students' Section).

February 28th.—Council of Birmingham Chamber of Commerce; Electrical Contractors' Association; Electrical Contractors' Association of Scotland; Electrical Wholesalers' Federation; Illuminating Engineering Society; National Register of Electrical Installation Contractors.

March 1st.—Association of British Chambers of Commerce; Bankers and Bank Managers; Birmingham and District Master House Painters' Association; Gunmakers' Association; Midland Home Grown Timber Merchants' Association.

March 2nd.—Ironmongers' Federated Association; British Cast Iron Research Association; Birmingham and Wolverhampton Hardware Factors' Association; Retail Trade Section of Birmingham Chamber of Commerce; Lord Mayor's reception and dance to exhibitors and buyers.

March 3rd.—Electrical Association for Women; Institution of Quarry Managers; British Electrical Development Association; Incorporated Municipal Electrical Association; Provincial Electric Supply Committees of the United Kingdom.

March 4th.—Sir Worthington-Evans, Bt., G.B.E., Secretary for War; Birmingham Chamber of Commerce banquet.

The Exhibits.

British Thomson-Houston Co., Ltd.

On this stand are shown many electric motors and control equipments for industrial drives selected from the wide range which has been designed to meet to modern requirements of various industries. The whole of the company's exhibits, including "Fabroil" silent pinions, "Tungar" rectifiers in

various sizes for the charging of accumulators from an a.c. supply, as well as other items of electrical equipment, are displayed so that each piece of apparatus is seen by visitors approaching the stand from any direction. Concise particulars with reference to each exhibit are displayed adjacent to the exhibit. The motors shown are of various types, and range from fractional h.p. machines to representative examples of machines for group or individual drive of industrial plant. For single-phase a.c. circuits, the B.T.-H. repulsion induction motor is designed to start up easily under heavy load and run at high power factor at constant speed. Occupying a position of prominence on the stand is the "No-Lag" induction motor for three-phase circuits. This motor, in addition to possessing all the advantages of the ordinary slip-ring induction motor, is designed to run at unity or leading power factor.

A new range of motors (Type U) is represented by motors both for d.c. and a.c. circuits. These motors possess many interesting features, both mechanical and electrical, such, for example, as ball and roller bearings, spigoted end shields, special windings and brushgear. A.c. and d.c. motors of the same ratings identical in all essential dimensions can be supplied, if required. There are no joints in the rotor cage, and as only one metal is used, both for bars and end rings, the likelihood of fracture due to unequal expansion of

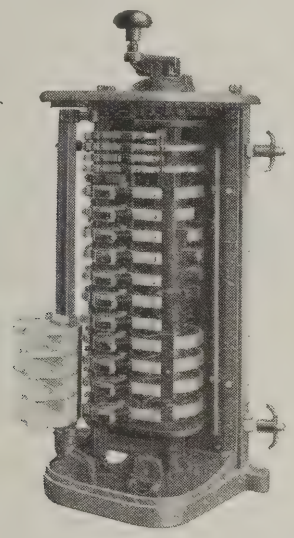

Fig. 2.—A B.T.H. Drum-type Controller.

dissimilar metals is avoided. The rotor is, therefore, practically indestructible under service conditions. The motor control gear exhibited comprises numerous types for a.c. and d.c. motors, and is mostly of the pillar type for floor mounting, although in many instances it can be supplied also for wall mounting. The equipments cover the requirements for all sizes of electric motors from 0.5 to about 250 h.p. Included in the range of motor-control equipments is a reversing drum controller of new design (fig. 2), which has been developed for use with a.c. or d.c. motors operating industrial equipment, such as cranes, hoists, and the like. When the front cover is removed, by the release of four spring catches, the whole of the inside of the controller is accessible. The cable space is claimed to be much larger than in any previous design, and other important points include a mica-insulated barrel shaft and finger bar, an easily removable cylinder, and large and renewable finger tips. Another interesting exhibit is that of a new type of light unbreakable resistance in which the grids are so graded that the appreciable temperature resistance coefficient usually associated with all unbreakable resistances does not adversely affect the equipment with which they are used. B.T.-H. control pillars are represented by examples for a.c. and d.c. motors. The arrangements in the "Type ATP" control pillars for slip-ring induction motors up to about 250 h.p. comprise a "dead man's handle," which must be firmly gripped during the starting operation; a drum-type starter with controller-type fingers; starting resistances; contactor-type circuit breakers with an improved form of blow-out and fitted with overload relays; triple pole, double break, isolating switch; complete safety interlocks; simplified wiring, and cable bushes or outlets for screwed conduit, the whole being mounted in a sheet-steel case. By the provision of a robust slow-motion device, starting up cannot be carried out too rapidly, and the gear is fully interlocked. An equipment of the oil-immersed pattern for starting slip-ring induction motors is also shown. This is for motors up to about 40 h.p., although larger panels are manufactured, and comprises an oil-immersed circuit breaker and oil-immersed rotor starter. An improved form of Y-delta air-break starter for squirrel-cage motors is also exhibited. A neat starting panel for d.c. motors up to about 18 h.p. is that designated "Type CDM." Contained in a dust-tight and weatherproof cast-iron case are a starting rheostat, line switch, two fuses, low-voltage release and overload relay. The cover is interlocked with the main switch, and the line terminals are shrouded. Switchgear for use where totally-enclosed, dust-proof and drip-proof enclosure is required is also shown, two patterns being exhibited—one, "industrial" and the other "flame-proof" for use in fiery mines. A complete switchboard may be assembled by bolting together the required number of units.

Metropolitan-Vickers Electrical Co., Ltd.

The display of this company and its associate Metro-Vick Supplies, Ltd., is designed to show the wide range of manufactures produced by the organisation. The parent company exhibits examples of its heavier equipment, including several types of motors. Standard d.c. motors for industrial service (Type X) form one part of the exhibit. These are made in sizes ranging from 0.5 to 250 h.p., and are particularly applicable to the driving of machine tools, either for long continuous periods or where there are frequent reverses and stops. Shunt, series, and compound designs are shown, each class having its particular applications. The squirrel-cage and slip-ring motors shown represent a recent development of design for general industrial use. Another special type of motor shown is described as a "Utility" motor. This is designed to have the same dimensions for approximately the same power, whatever type of circuit it is to be employed upon; the rating is about ¼ h.p., and ball bearings are employed. Closely related to the motor section is that comprising starting gear. The d.c. starters exhibited are the "S5D" for motors up to 0.5 h.p., and the "S8D" for powers of from 1.5 to 3 h.p. The smaller starter is of the protected type, fitted with no-volt release, arranged for wall mounting, and is manufactured on mass production lines. Incorporated in the larger pattern are no-volt and adjustable overload releases. The "SD" starters are also made in sizes ranging up to 50 h.p. (500 V). The "S.L.S." switch is a new design of air-break starter for squirrel-cage motors from 1 to 10 h.p. It can be connected as a star-delta, series-parallel, or direct starter for single-, two- or three-phase machines, giving protection against overload, interrupted service and incorrect operation. Simplicity is the main feature of its construction. The switch mechanism is of the drum-controller type, giving two breaks per pole. The starter can provide good service in many industries where individual motor drive is employed. Another interesting exhibit is a combined stator and rotor starting panel for industrial motors of up to 300 h.p. Here, again, the design has been simplified to reduce initial and maintenance costs. The switch mechanism is of the free-handle type, giving two breaks per pole under oil. The con-

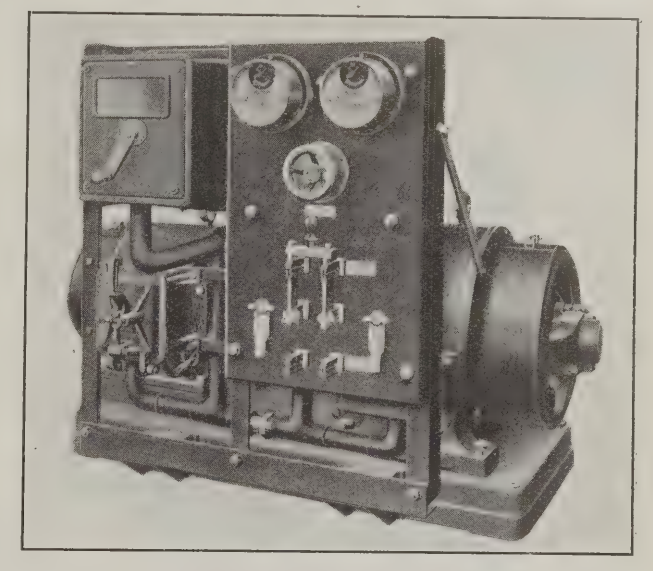

Fig. 3.—A M-V. Single-operator Welding Set.

tacts are of the rolling butt type and self-cleaning. Provision is made for the mounting of instruments. Our illustration (fig. 3) shows a single-operator arc-welding set complete with control gear and switchboard. The motor is arranged for either d.c. or a.c., and the generator has notable self-stabilising characteristics by which it maintains an arc giving constant heating effects without the use of a resistance. This saves energy and makes it easy for the operator to strike and maintain the arc. The company also makes up multiple-operator sets, in which case the supply to a number of welders is from a common set, and each welder has a separate stabilising resistance.

The company also displays its improved system of protection for coal-cutting machines. This comprises a special gate-end starting box, containing a main contactor with protective and re-setting devices, a control switch for mounting on the coal cutter and a standard form of trailing cable with suitable standard terminal plug. Complete control of the gate-end apparatus is effected by means of the control switch on the coal cutter.

The principal features of the Metro-Vick Supplies section of the stand are two "Cosmos" electric cookers. The smaller is suitable for a family of 4-6 persons, and the other for from 6-10 persons. Both models are fitted with the new "Cosmos"

boiling plate, which, upon test and in service, has proved to be very efficient and reliable. The main point in this plate is the use of a special insulating material, crystalline magnesium oxide (or hydroxide), which is made up in tube form to contain the coiled heating element. By a special process the material and the element are caused to come into intimate thermal contact. A later development is shown—a double-ring enclosed boiling plate. A number of "Cosmos" radiant fires are shown, as well as irons, jugs, toasters, fans, and wiring accessories. The last include "Emvee" lampholders, cord grips, switches, ceiling plates, &c., most of which have been described in our pages. "Cosmos" lamps and valves form another interesting section.

Gent & Co., Ltd.

Amongst the most interesting exhibits here are examples of "Pul-syn-etic" electric clocks for home, office, or industry, with automatic bell-ringing apparatus; "Reflex" control for existing workmen's recorders; "Duplex" control for existing turret clocks; "Tangent" electric motor sirens for large factories, workshops, or offices, in sizes ranging from ¼ to 4 h.p., and intended for fire alarm, time signals or any other emergency call signals. There is also shown a large selection of incombustible bells, hooters, and keys for industrial uses, and the mining engineer will be interested in the display of bells, relays, keys, telephones, &c., all of which are incombustible and flame-proof. The Parsons-Sloper telephone, which is displayed, is intended for intercommunication purposes and ensures secret conversation on an ordinary single-line wiring installation. The wireless exhibit includes the "Touchstone" loud-speaker, which is claimed to reproduce every note from the highest to the lowest. There are also battery eliminators and many other radio accessories. The company again shows its "staff locator," by means of which the attention of principals or staff in large or small factories can be attracted.

General Electric Co., Ltd.

This company again has a large and varied display of its manufactures which conveys a good impression of the manifold activities associated with the initials "G.E.C." It must be said, however, that the company's principal exhibit is its Witton works, to which all visitors to the Fair are invited. The stand has a length of 100 ft. and is divided into five sections, which are lettered from "A" to "E." Section A comprises a complete range of "Osram" lamps and valves. The lamp range embraces practically every type of lamp forming the regular output of the company's works at Hammersmith, *viz.*, lamps of standard vacuum and gasfilled type, automobile and ship types, sign and striplight lamps, &c., including the white, pearl, and colour-sprayed patterns. The range of valves covers both the transmitting and receiving types, and

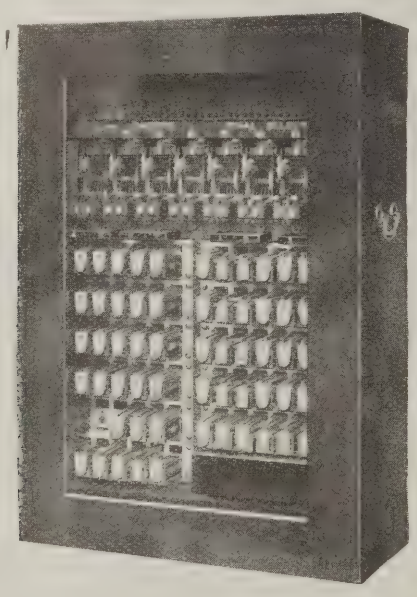

Fig. 4.—A "G.E.C." Automatic Exchange.

a number of "Gecovalves." The Osram receiving valves include the new D.E.P. 215, the D.E.H. 612, and D.E.L. 612 "Steep Slope" types, which have just been placed on the market. The K.L.1 type, embodying revolutionary principles, is shown. This has an indirectly-heated cathode, and is operated direct from a.c. supply mains. Section B comprises "Magnet" household electric appliances, which cover practically every ordinary home requirement. The items include electric irons, kettles, toasters, boiling plates, grillers, cookers, washers and wringing machines, cleaners, various designs in electric fires and electric fans, and the most recent addition to the list of "Magnet" household appliances, an electric refrigerator, which is shown in operation. Section C is used as a reception room and for staff purposes. In Section D a variety of the smaller electrical accessories is on view. Included among them are a number of electric lighting accessories, such as switches and fuseboards, and a working model of a motor-driven switch operator. Industrial electrical accessories are represented by recent developments in switches and fuses, circuit breakers, starters, and measuring instruments. A selection of samples of bakelite moulded insulation products, specimens of wires and cables, &c., also appears in this section. Section E contains a display of the company's telephone productions, such as the standard type, table type, wall type, intercommunication type, &c. In addition there is a varied show of electric bells and bell indicators—of the household, colliery, ship, and similar patterns; specimens of miners' lamps, and Leclanché and dry cells, batteries and accumulators. A selection of "Gecophone" wireless sets, components and accessories, is also on view in this section, including several of the most successful lines introduced this season. A 25-line automatic telephone exchange is shown in operation (fig. 4).

Mawdsleys, Ltd.

This company is showing various sizes of its patent d.c. dynamos and motors, including a vertical high-speed machine. It is also exhibiting examples of the "Creedy" patent binary convertor arranged to convert from a.c. to d.c. current in one machine. This machine consists essentially of a squirrel-cage induction motor and a d.c. generator in one frame, the d.c. side having all the characteristics of a separate generator. This result is obtained by a special method of winding, the rotor consisting of an ordinary d.c. winding with certain cross connections. The chief advantage of this convertor is that the d.c. side can be given all the characteristics which can be obtained from an ordinary generator, that is, it can be shunt wound for battery charging, compound wound, series wound, or with reverse compound characteristics such as are required for electric welding. An example of the binary convertor specially wound for welding is shown in operation. Other exhibits include an ordinary rotary convertor for use in welding, a small motor with self-contained reduction gear giving a reduction of 16 to 1, and the "Mawdsley" patent lightweight "showman's" dynamo.

Yorkshire Switchgear and Engineering Co., Ltd.

This company is showing two steel kiosk transformer substations. One of these is for a 3,000-V single-phase system, the other for 11,000-V, three-phase, and both are complete with all necessary gear. A variety of oil-immersed circuit breakers, for voltages up to 11,000, is shown, together with cubicle, pedestal, and other mountings for indoor use. There are examples of oil-immersed fuse isolators which cheapen the cost of connections to a h.p. system in the case of small consumers. A 30-A, 6,600-V, three-phase equipment is shown which may be used with ordinary wire fuses or with the company's patented spring fuse, and as the switch mechanism is of the quick-break type, the equipment may also be used as an oil switch to break its rated load. High-pressure specialities for outdoor use include fuses for 11,000-V circuits and quick-break automatic isolating switches with overload trip, whilst the low-pressure exhibits include a sub-station panel for 1,000 A at 500 V and steel feeder pillars for network subdivision. Examples are shown of the company's combined service switch-fuse and end strain, of which many thousands have been supplied for Home, Colonial, and foreign use on systems employing overhead distribution. A varied selection of the company's specialities for use on transmission line and railway electrification work is also on view.

M-L Magneto Syndicate, Ltd.

This exhibit falls roughly into three classes—small permanent-magnet generators, pneumatic-electric miners' lamps, and synthetic resin mouldings. The machines in the first class have a permanent magnet field system, and consequently no difficulties arise on high-voltage machines due to the fragile nature of the fine wire which would be necessary for the field windings. The constancy of the working flux in this type when used as a generator permits the voltage to be directly proportional to the speed, which will remain constant when supplied at a given voltage and under a given load. The direction of rotation can be reversed by reversing the polarity of the supply leads, which varies from the method with the orthodox type. A particular application of this type of machine is found in the M-L anode convertor exhibited, which forms a substitute for dry batteries normally used for supplying anode current to wireless receiving sets. This machine consists of a small motor-generator, with suitable l.t. and h.t. smoothing circuits, and regulating resistances contained in an aluminium case, the current being supplied from an ordinary l.t. filament battery. On account of the use of the permanent field, the current consumption is low and the drain on the battery small. The machine can be supplied for any secondary pressure up to 300 volts, and is also supplied with a tapping switch on the h.t. side, this permitting a simultaneous operation on a low-frequency amplifier at a high voltage and a detector or high-frequency amplifier at a reduced voltage; the voltages and the two circuits can be varied independently. The pneumatic-electric miners' lamps are a further development of the application of cobalt steel magnets to small generators. The lamps, which are capable of giving up to 100 c.p., consist of a small revolving-field alternator, direct coupled to a compressed-air turbine. They are fitted with a patent safety device which automatically short-circuits the generator in the event of any breakage or interference with the protecting glass over the lamp.

THE LONDON SECTION.

In the Fair as a whole this year nearly 1,600 British manufacturers are displaying their products: of that number some 600 are in the Birmingham Section, so that the London section, which is housed at the White City at Shepherd's Bush, consists of over 900 exhibitors. Of course, all the stands are not of electrical interest; of those that will appear electrically to the visitor, the great majority are featuring broadcast radio-telephone apparatus and accessories, the number of exhibitors in this class being about 60.

Brownie Wireless Co., Ltd.

The principal items on this stand are the No. 2 model crystal receiver and two-stage note magnifier (fig. 5), and a special appeal is being made to foreign and Colonial buyers; it is significant that the Company has found it necessary to publish instructions in booklet form in no less than 16 different languages. Part of the display is devoted to mouldings:

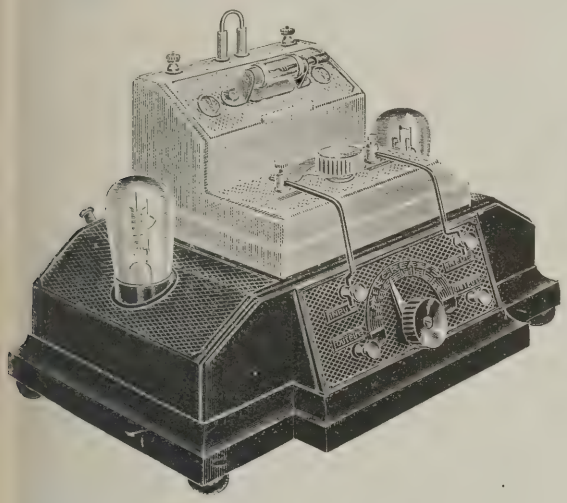

Fig. 5.—A Crystal Receiver and Two-stage Note Magnifier.

while ostensibly a manufacturer of wireless equipment, the firm has for some time had a special department which undertakes moulding by contract, in bakelite, fireproof and plastic. This department is equipped with machinery that includes special hydraulic presses working up to 750 tons pressure and capable of high-speed production.

Synchronome Co.

At the entrance to the Watch and Clockmaking Section, the Synchronome Co. has an impressive display of electrical impulse dials of all kinds and sizes, ranging from the domestic to the turret clock. The almost life-long devotion of Mr. F. Hope-Jones to the application of electricity to horology has carried the Synchronome system far, and the display is devoted to its commercial uses. To demonstrate the absence of mechanical clockwork, a turret dial of 10 ft. diameter is simulated, the figures being represented by twelve small electrical impulse dials in operation and the great hands driven by a movement which is so small as to be concealed by their central bosses. Weather-proof high-temperature enamelled dials are also exhibited, some shown mounted in pairs, back to back, to represent huge watches; they form effective bracket clocks, and the silent operation of electrical impulse dials is demonstrated by a reproduction of those used throughout the studios of the British Broadcasting Corporation at 2LO: placed close to the microphone, they advance in seconds and are of 18 in. diameter, yet they cannot be heard by the most sensitive receiver.

Dowsing Radiant Heat Co., Ltd.

Samples of special electrical heating appliances are on view, including irons for the use of tailors, dressmakers, laundries, and milliners, as well as branding irons, soldering irons, water heaters, radiators, and certain electro-medical appliances, such as the "Solarium" electric sun bath.

Mr. A. Hinderlich.

Devoted to crystals and their applications, on this stand detecting crystals are shown in great variety, also a re-issue of the most successful type of crystal detector, and an outstanding novelty is an actual 23-metre transmitting station, arranged for quartz control, which unit is shown in operation. Quartz crystals arranged as wave-length standards for the calibration of wave-meters, &c., on broadcast and short waves are featured as well.

Telegraph Condenser Co., Ltd.

The Company's range of condensers includes the Mansbridge and mica types; suitable patterns for use with radio battery eliminators, for "smoothing" at various voltages, and others for high-frequency work and for power-factor improvement purposes.

Mr. R. H. Dent.

The "Ardente-acoustique" devices shown represent improvements in electrical aids for the deaf. A new earpiece is the size of a shilling and the microphone is no larger than a florin, being as useful in a hall as in general conversation. The new auditorium type, for use in public halls, &c., where the acoustic properties are poor for deaf people, is very small, and so constructed that hearers can sit in any part of the hall. It is mellow and true-to-tone for music and words, meetings, &c.

Read Radio, Ltd.

This firm makes the 4-valve ".Real" receiving set, which is neat in appearance and, although it is portable, does not betray the fact that it is a wireless instrument when carried; it has one control and will receive the local station, Daventry, and Radiola at comfortable strength. The new 4- and 5-valve sets (fig. 6), described as very selective, have been designed

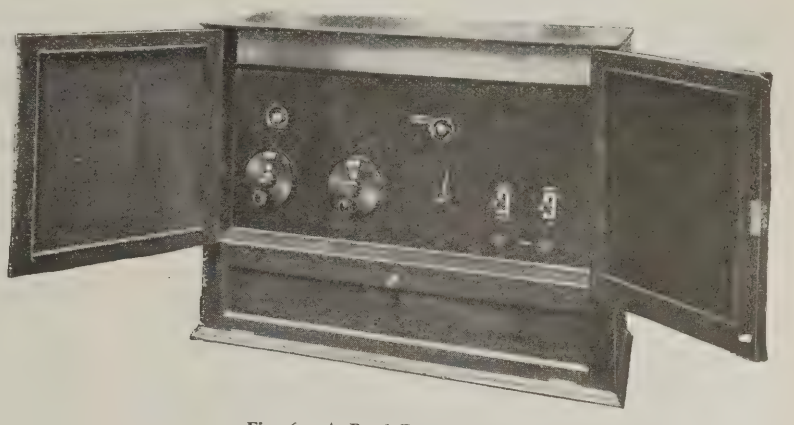

Fig. 6.—A Read Broadcast Receiving Set.

to enable the user, when situated at a reasonable distance from the local station, to cut it out and hear Continental stations. Both instruments embody two high-frequency valves that are claimed to be controlled in an original manner. No reaction is employed, and their manipulation is simple.

Ever-Ready Co. (Great Britain), Ltd.

The company has arranged two exhibits—a comparatively small stand is devoted to its range of wireless dry batteries and accumulators, whilst on a double stand is a display of the other manufactures, including batteries of all types, motor-car lighting accessories, and portable lamps.

Electrolux, Ltd.

The home cleaner bearing the above name yields high suction efficiency and calls for little physical effort on the part of the user in the course of work. There are no screws to adjust, the bag is totally enclosed, dust and dirt cannot get near the motor or fan, the suction will pick up solid bodies without affecting the machinery, and the user has no weight to carry. Without mechanical moving parts to call for attention and without noise or vibration, the company's refrigerator performs, in the home, the full duty of the most elaborate mechanical ice plant for the preservation of foodstuffs, beverages, and for the making of ice for the table or the sick room.

"Attracta" Electrical Co.

Various signs for window display and outside use are shown, including the "Flash-o-Graph" type which has the advertising matter embossed at the back of a polished plate-glass panel; the latter is mounted on a metal stand fitted with a 60-watt "Tubolite" lamp, and every time the auto-flasher operates the letters on the glass are effectively illuminated. The "Luminous" changeable letter sign consists of overlapping slats spaced apart and arranged to form a screen between the electric lamps inside the sign and the observer, so that the screen (on which the letters are hung) is illuminated while the light source is concealed from direct view. The "Nigrasine" animated sign has a design or wording outlined with glass tubing, through which is pumped (by means of small electric motor) coloured liquid and air bubbles, and is very effective by day as well as night; a new illuminated type is being shown for the first time, the advertising matter being stencilled out and backed with glass tubing arranged horizontally: coloured liquid courses through the tubes and is illuminated from behind, striking quite a new note in illuminated signs. The principle can be adapted to window reflector signs.

A.C. Measuring Instruments.

The more important developments in the design and construction of indicating and recording, as distinct from integrating, meters; and an account of some of the authors' investigations.

By Lieut.-Col. K. EDGCUMBE, R.E. (T.A.), Vice-President, and F. E. J. OCKENDEN, Graduate I.E.E.

(*Abstract of Paper read before the* Institution of Electrical Engineers.)

(*Concluded from page* 234.)

Synchronous Motor for Timing Purposes.—The advantages of driving the charts of graphic meters by means of a synchronous motor have been alluded to, but it is only recently that a sufficiently compact self-starting synchronous motor has become available. Such a motor, due to Mr. H. E. Warren (fig. 3) has a laminated field magnet A which carries a winding B and is provided with two short-circuited copper rings CC, which produce a rotating field in the air-gap. A steel disk D is caused to rotate in the air-gap under the influence of the rotating field, not owing to eddy currents generated in it, but to hysteretic drag. The speed increases until synchronous speed is reached, when north and south poles are induced at definite points in the steel ring and the coercive force is so great that considerable mechanical force is required to pull it out of step. The disk is geared to the spindle E in such a way that, at the working frequency, this spindle revolves once per minute. All the moving parts are enclosed in a dust-tight housing F, containing oil. The construction is such that the entire motor, together with its housing, can be removed and replaced by a new one, should occasion arise, without

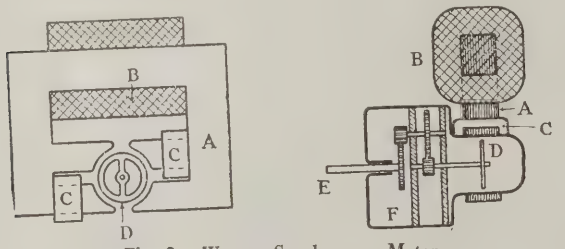

Fig. 3.—Warren Synchronous Motor.

disturbing any of the other parts. The overall dimensions are 2 in. by 2½ in. by 2½ in., and the power consumption is normally about 3 watts at a power factor of about 0.4. The torque exerted at the spindle E, before the rotor will drop out of synchronism, is well over 500 gramme-cm., which is about 1,000 times as great as the normal torque of a powerful spring-driven 8-day graphic-meter clock.

In order that the speed may be precisely one revolution per minute, it is essential that the frequency of the power supply should be correct; momentary fluctuations are of no consequence, so long as the average frequency is maintained at a constant value. This is ensured by installing at the power station an accurate clock combined with a synchronous motor in the same case; the hands of the two mechanisms may be mounted concentrically on the same dial, or the clock and motor may act differentially upon a single hand, which by its sense of rotation shows the difference in speed between clock and motor. The attendant has only to note, occasionally, the position of the tell-tale hand, and if the motor is seen to be running in advance of the clock he slightly lowers the speed of the generator, or *vice versa;* it is found easy to keep the average frequency correct to within 15 seconds per day, which would correspond to a precision better than 1/50th of 1 per cent. in the case of an indicating frequency meter.

Apart from the convenience of driving timing mechanisms, the advantages of maintaining correct frequency are daily becoming more important. For the driving of many classes of machinery, notably in textile factories where the output depends upon the maintenance of a minimum speed, but one which cannot be greatly exceeded without impairing the product, everything depends upon the maintenance of a correct motor speed. In paper mills, again, the quality and texture of the product are intimately bound up with the speed of drive. If the system frequency is kept truly constant in the way indicated, the electrical drive gives an exactness of speed which cannot even be approached by any other known method. Again, when sections of a large system have on occasion to be run in parallel with one another, much time can be saved and shocks to the system avoided, if the frequency of all sections is standardised, so that they can be instantly thrown into parallel without a lengthy and often laborious preliminary adjustment of speed.

Given standardised frequency, innumerable uses for timing motors will suggest themselves: graphic and maximum demand meters are examples, but a still larger field of usefulness is in connection with time switches, where the demands on the clock are severe and the question of winding and regulating is a serious one; these troubles entirely disappear if the time switches are driven by synchronous motors. In the United States of America, where the use of this system is rapidly extending, several central stations are encouraging their consumers to use synchronous motors for operating time recorders and multiple clock systems in factories and large institutions, and even for the more humble domestic clock. A consuming device with a load factor of 100 per cent., even at a power factor of 0.4, is not altogether to be despised. Warren synchronous motors have been applied with great success to the construction of time meters for the measurement of short intervals of time down to 1/20th second, in connection with relays, circuit breakers, integrating meters, &c. A spindle is driven from the synchronous motor at a steady speed of one revolution per second; that is to say, on a 50-cycle system the rotor is geared down 50/1. A pointer, which is carried round by friction with this spindle, is normally held stationary by means of a clutch which can be released by a solenoid.

Instrument Transformers.—Voltage transformers differ but little from power transformers, and present few special difficulties to the designer. Current transformers, on the other hand, represent an entirely different problem which affords considerable scope for ingenuity. Although the design has some effect upon minimising both magnetising and iron-loss currents, each depends, ultimately, upon the nature of the material used for the core, so that it is in this direction that the designer must turn. Fortunately, during the last few years several new and promising iron alloys have become available. Fig. 4 shows, for three different materials, the relationship between the flux density expressed in gauss and the magnetising current expressed in ampere-turns per centimetre length of iron path.

Curve I refers to a brand of silicon-steel which is much used in this country for instrument transformers, and is quite suitable for all voltage transformers and for the majority of current transformers, but the silicon-steel to which Curve II refers shows a reduction of about 25 per cent. in magnetising current so that a current transformer constructed with this material would have a phase displacement smaller by 25 per cent. Curve III refers to a nickel-iron alloy ("Mumetal") in which the magnetising current is so much lower that the phase displacement will be less than 18 per cent. of that for the transformer having a core of material I.

The iron-loss characteristics of the three materials are somewhat similar to the magnetising-current characteristics of fig. 4, except that neither of the silicon steels I or II shows any great improvement over the other. The great improvement brought about by proper annealing is clearly seen. Although it is possible to obtain satisfactorily annealed transformer iron in the sheet, it is invariably found that after stamping into rings both the magnetising and iron-loss currents have very markedly increased (the former by perhaps 25 per cent.) so that it is necessary to re-anneal the finished rings.

The design of iron-cored current transformers for radio frequencies cannot be dealt with in any detail. Owing to eddy currents, the depth to which the flux penetrates the iron laminations rarely exceeds an effective depth of ½ mil, so that the permeance of the magnetic circuit depends rather on the number of laminations than on the total thickness of the iron, thus leading to the use of the thinnest possible stampings; for example, 1½ lb. of 12-mil sheet is no more effective than 4 oz. of 2-mil sheet.

In order to keep the iron loss at radio frequencies within reasonable limits, it is essential that the total flux should be small, although the effective flux density may be fairly high.

Owing to the above-mentioned phenomenon the flux density tends to remain constant over a wide range of frequency, the flux penetrating more deeply into the iron at the lower frequencies. For a given core, the ratio variation tends to decrease with increasing frequency. Whilst 20 mils is a convenient thickness of stampings much used for power frequencies, a thickness of 5 mils is to be preferred for radio frequencies. It should be noted that, owing to the leakage inductance of the transformer, the secondary induced voltage increases with the frequency, such increase being relatively greater at low burdens, as evidenced by the ratio falling off less rapidly with increasing frequency than is the case at the heavier burdens. To ensure a uniformly low flux density, it is essential that the entire length of the iron circuit should be covered by the secondary winding and that the fields due to the primary and secondary windings should effectively coalesce; for currents exceed 10 amperes the number of primary turns is few and the leakage flux becomes so great

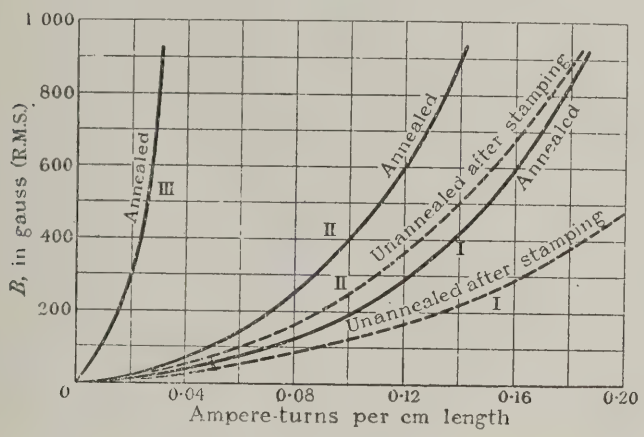

Fig. 4.—Transformer Iron B/H Curves, a.c.

that the iron overheats and the ratio error exceeds the permissible limits. This difficulty can be overcome by completely surrounding the iron core and the secondary winding by a single-turn primary, as shown in fig. 5, which represents a 1,000-ampere current transformer as installed at the Rugby wireless transmitting station. The current enters at A, passes up the central tube B, which threads through the core C with its secondary winding D, and thence returns by way of the outer shell E to the other terminal F.

Some ingenious methods have recently been proposed for lessening the phase displacement in current transformers, but usually at the expense of constancy of ratio. Even with this limitation, such expedients are sometimes useful, particularly for use with wattmeters on loads of very low power factor, since it is usually easier to comply with requirements as to ratio than as to phase.

A preferable solution, in the authors' opinion, lies in the design of a normal current transformer, but provided with a core of nickel-iron (see Curve III in fig. 4). The characteris-

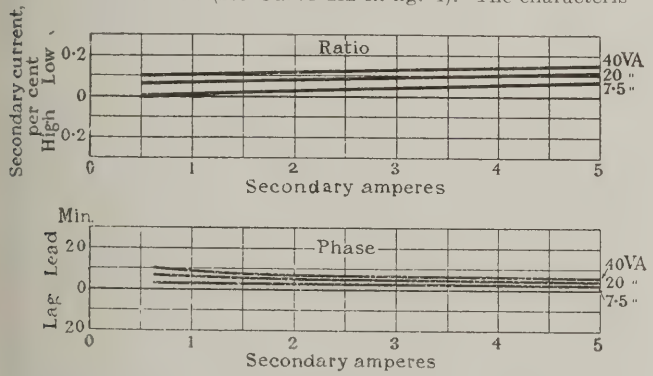

Fig. 6.—Ratio and Phase of "Precision" Current Transformer with Non-inductive Burden.

tics of such a transformer are remarkably good, as will be seen from the ratio and phase curves given in fig. 6 for a transformer wound for 1,200 ampere-turns at rated current. The characteristics may be summarised, for burdens of 7½, 20 and 40 volt-amperes, respectively, at 50 cycles, as in Table I.

TABLE I.

From rated current to 1/5th rated current.			From 1/5th rated current to 1/10th rated current.

Phase Displacement in Minutes (Lead).					
3	6	8	4	8	10

Whilst the cost of a nickel-iron current transformer is necessarily very much higher than that of one having a silicon-steel core, yet for precision work, either in current measurements or for use with a wattmeter, the extra cost may be fully justified. For example, the above current transformer used in conjunction with the "Precision" moving-iron ammeter described in an earlier part of this paper will have a combined electrical accuracy of 0.15 per cent. throughout the working range, at any ordinary frequency; or, if used with a wattmeter at a power factor as low as 0.2, the error due to the transformer would not exceed 0.5 per cent. and would probably be less, owing to the fact that a wattmeter forms a somewhat inductive burden.

The difficulties of designing a satisfactory bar-type* current transformer for a small primary current are considerable. It, however, presents advantages from the point of view of insulation, capacity to withstand short-circuits, immunity from damage by surges, as well as cheapness and general convenience in erection. If the primary current is low, there being only one "turn," B must be relatively high and/or the cross-sectional area of the core unduly large, which will lead to a large phase displacement unless a material with a high permeability is used. The nickel-iron alloy of Curve III in fig. 4

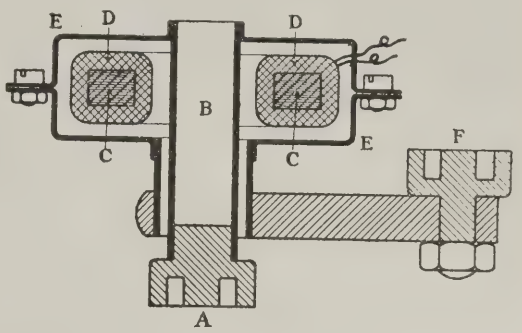

Fig. 5.—Radio-frequency Iron-cored Transformer.

fulfils this condition. A bar-type current transformer for use with an indicating or integrating wattmeter, which may form a secondary burden of from 2 to 5 volt-amperes, entails reasonable accuracy: down to 1/10th rated current the ratio must be correct to within ½ per cent. and the phase displacement must not exceed 90 minutes. In the case of a transformer for use with ammeters and relays, ratio alone need be considered; it will have to be correct to within 1 per cent. down to 1/10th rated current with a burden of 10 volt-amperes. Fig. 7 shows the ratio curve of a bar-type current transformer designed on these lines and having a ratio of only 60/5, with a burden of 10 volt-amperes at 50 cycles: it possesses more than the required accuracy in spite of the excessively low value of the primary current, and the shape is of interest when compared with a more normal curve. If the iron loss varies as B^2, the transformation ratio of the current transformer will be constant at all currents (the curve will be a horizontal straight line). If n in the expression Iron Loss $= kB^n$ is less than 2, as is the case with silicon-steel, the curve will slope downwards: for the nickel-iron core of fig. 7 the ampere-turns are low, so that the flux density at rated current is relatively high and the value of n changes from about 2.2 at low flux densities, resulting in an upward slope of

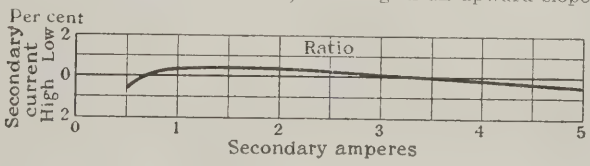

Fig. 7.—Ratio of Bar-type Current Transformer, 60A.

the curve, to 1.8 at high flux densities, resulting in a downward slope. At secondary currents between 1 and 2, the ratio curve is sensibly horizontal, indicating that the value of n is approximately 2.

Instrument Overloads.—Under modern conditions, the overloads to which measuring instruments may be subjected are extremely severe; in fact, fault currents of 20 times the rated carrying capacity must be regarded as quite normal, and of 100 times as by no means uncommon. When it is remembered that the watts dissipated in a meter carrying 32 times its rated current are 1,000 times what they were at rated current (that is, watts become kilowatts) it might be thought that meters would often be "burned out." Experience shows this to be a comparatively rare occurrence, however, and that it is mechanical damage to the moving parts which is most to be feared.

The behaviour of current transformers under short-circuit conditions must therefore be carefully considered with respect to both mechanical and thermal stresses. For example, in current transformers the leading-in conductors of which pass through a single insulator, thus not only saving cost but also improving the insulation, if the distance apart of the two con-

* Variously called "single turn," "straight," "straight through," "bar," "bushing," "stud," "open primary," &c.

ductors is ¾ in. and their length 12 in., the force of repulsion, should the momentary short-circuit amount to 50,000 amperes (r.m.s.) would be over 2½ tons. In this respect a concentric arrangement of the leading-in conductors is much better calculated to withstand the stresses. None of the current transformers tested, with the exception of the bar type, were mechanically capable of withstanding the momentary applica-

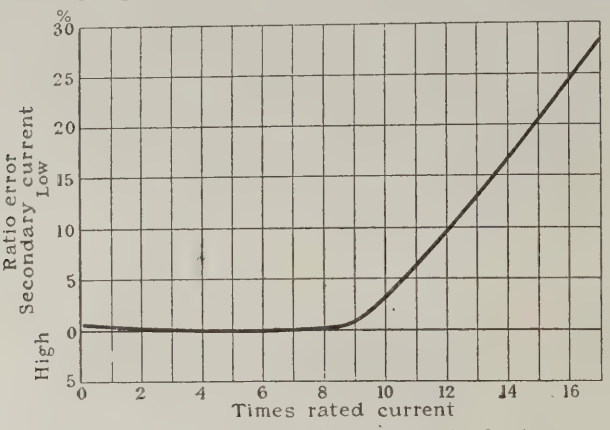

Fig. 8.—Ratio of Current Transformer under Overload.

tion of a current equal to that which they would withstand for ½ sec. from the point of view of overheating alone. All, however, safely withstood 100 times the rated current and may therefore be considered satisfactory.

To obtain data from which the point of break-away from proportionality could be determined, experiments were carried out, and fig. 8 shows the ratio error of a transformer up to 17 times the rated current; up to about nine times the rated current (at which point the secondary output would be 2,400 volt-amperes) the ratio is reasonably constant, but above that point it falls away sharply. Thus, the point of break-away from proportionality depends upon the primary ampere-turns and the dimensions of the core, and is therefore largely under the control of the designer.

A really severe fault must be cleared within a very short

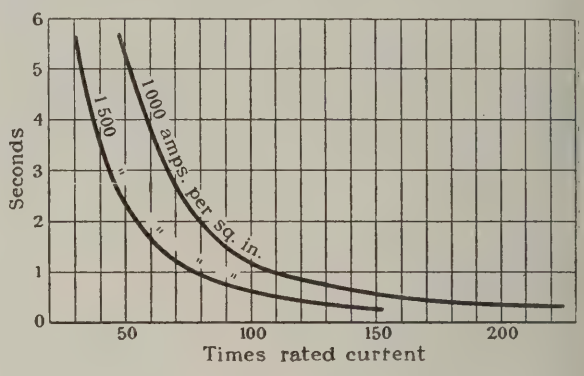

Fig. 9.—Heating of Current Transformer by Heavy Overload.

space of time or any transformer in its path will inevitably be destroyed through over-heating.

Fig. 9 shows the length of time which will elapse before the temperature has risen by 200 deg. C., with various overloads and for current densities of 1,000 and 1,500 amperes per square inch, respectively, at rated current. Air-cooled transformers have been assumed, as oil-insulated or compound-filled transformers are not so satisfactory in this respect.

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

A "Pin Jack" Voltmeter.

Whilst the necessity for providing electrical measuring instruments for use in connection with broadcast radio-telephone sets has not hitherto been generally realised, the time seems to be approaching when their important influence on the correct operation of receivers will be accorded due consideration. To ensure the best results, valve makers' values should be adhered to closely, and it is obviously unsound to rely on trial and error methods in the adjustment of three separate voltages: a voltmeter greatly facilitates such control, but it is necessary that it be of a suitable high-resistance pattern that is capable of checking the p.d. under normal working conditions. An instrument marketed by the Weston Electrical Instrument Co., Ltd., specially for radio service,

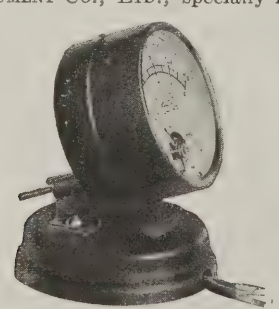

Fig. 1.—Weston High-resistance Voltmeter.

to aid the regulation of filament and plate voltages, for checking batteries, and the location of circuit faults is shown in fig. 1. Each instrument is supplied with a pair of pin jacks for mounting upon the back of the panel of the set by drilling two holes, which need not be exactly spaced because the terminals at the back of the voltmeter are made adjustable so that they can be plugged in with ease; when valve filaments are controlled by separate rheostats, it is advantageous to provide a pair of jacks for each. For checking the high-voltage plate battery, the voltmeter is withdrawn from the panel jacks and plugged into its high-range stand as indicated in fig. 1, the stand being connected to the battery by flexible leads. The instrument has a double scale, the 6-volt range having a resistance of 750 ohms, and the 200-volt range a resistance of 25,000 ohms; thus, the meter requires but 8 mA for full-scale deflection. It should be pointed out that the range shown in the illustration is not now the standard.

"Cosmos" Valves.

One of the most recent of the thermionic valves marketed by Metro-Vick Supplies, Ltd., is the DE.50 dull emitter. It is a good all-round stable type for circuits for which "shortpath" valves are not suitable; if substituted for a bright valve, the filament current will be reduced to about ½. The filament current is 0.09 A at 6 V; the anode voltage is from 30 to 100 V, 3 volts grid bias, and amplification factor 9. The mutual conductance is approximately 0.45 mA per volt, and the anode impedance about 20,000 ohms.

To the "shortpath" range has been added the SP.16/R (red spot) general purpose valve, which is claimed to be specially useful in reflex transformer- or choke-coupled sets. At 2 volts its filament current is 0.09 A; the anode voltage may be from 20 to 120 V, 4.5 volts grid bias, and the mutual conductance (slope of characteristic) is 0.4 mA per volt, the anode impedance being 16,000 ohms.

For incorporation in filament battery eliminators and for h.p. plate accumulator charging purposes the SP.41/U half-wave a.c. rectifier has been designed, with a total emission of more than 0.5 ampere, so that a long life may be expected. It is fitted with a standard 4-pin cap, the anode being connected to the anode pin and the grid pin having no connection. The filament takes 1.25 A, the maximum anode voltage being 250 V r.m.s., and the d.c. output 25 mA. For full-wave rectification the SP.42/U double-anode pattern is available, one anode being connected to the anode pin and the other to the grid pin of the standard cap. The filament takes 2.25 A, the maximum anode voltage being 250 V r.m.s. per anode, and the d.c. output 50 mA. Both these rectifiers are provided with a dull-emitting filament which should be heated through a 4-volt transformer or suitable rheostat.

The bulbs of all the above-mentioned valves are clear, the "getter" on an electrode extension plate apparently not depositing to any extent on the glass.

A Battery Charger.

A radio battery charger which enables electric light users to recharge their accumulators, both those used in the filament and plate circuits, at home from the ordinary lampholder, into which the device is plugged, easily and cleanly at low

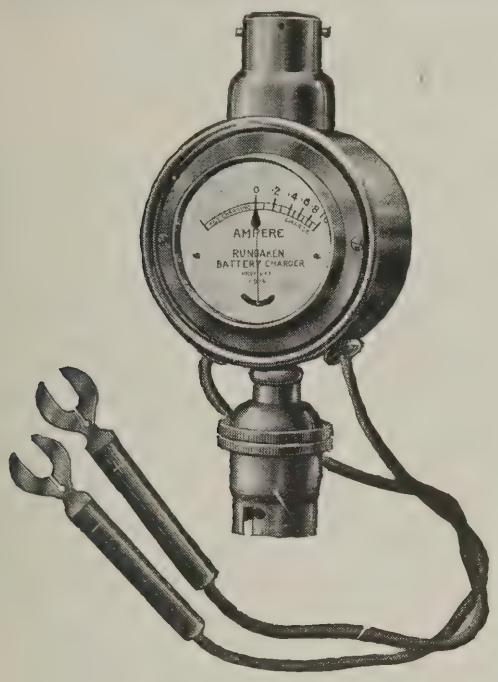

Fig. 2.—The Runbaken Battery Charger.

cost, is shown in fig. 2. The indicator prevents incorrect connection, and also indicates the amount of current passing into the cells. The model illustrated is suitable for use on d.c. mains only; it is marketed by the Runbaken Magneto Co.

The Baty Condenser.

The condenser illustrated in fig. 3 is a product of Mr. Ernest J. Baty. It consists of two aluminium plates, one of which is adjustable by screw, and the spindle tension is also adjustable; there is $\frac{3}{4}$ in. of insulation between the plate supports. It has a scale of 360 deg., and can be used over more

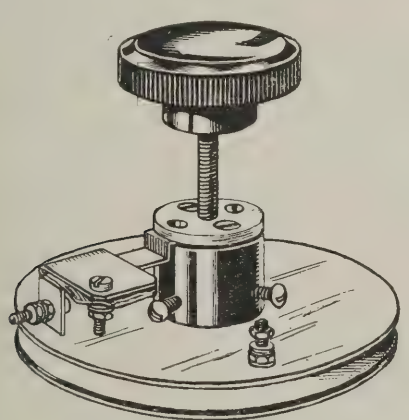

Fig. 3.—The Baty Condenser.

than one turn if desired; its weight is small and range large; it will tune one coil from 250 to 1,200 metres. The condenser alone, or the complete tuned-anode unit (coil, condenser, and grid condenser), are available, the total space occupied in the latter case being only 3 by 1 in., and the grid plate is entirely shielded at all positions.

Diesel Engine Users' Association.

At a meeting on February 4th, the newly-elected president, Mr. Geoffrey Porter, A.M.Inst.C.E., made an interesting statement concerning the growth of the Association during the period which had elapsed since his first term of office as president. The total horse-power of heavy-oil-engines represented by the membership of the Association at the present time was over 200,000 h.p., and was nearly 10 times what it had been in 1916. As recently as 1916 an individual capacity of 80 b.h.p. per cylinder had been usual, whereas at present engines were being installed for marine purposes of 1,250 b.h.p. per cylinder, and in the case of the nine-cylinder engine at Hamburg the power of each cylinder was over 1,600 b.h.p.

The Electromobile Association.

The First Public Meeting.

THE first public "Informal Meeting" of this Association was held at the Royal Society of Arts on Friday last.

The chair was taken by Mr. J. H. C. Brooking, M.I.E.E., who, in opening the meeting, said that it was very appropriate that it should take place on the eightieth birthday of that doyen in electrical science and industry, Edison, a man of wide vision, who foresaw a great future for electromobiles and who had done so much for their advancement. It must be recognised that while electricity had progressed in many ways it had not advanced to anything like the same degree in connection with electromobiles as it had in other directions. He imagined that the chief troubles were, in the first place, the high price of the vehicles, and, in the second place, the difficulties with regard to charging. The Association was arranging competitions, and the awarding of premiums for the best papers read before it during the year.

Mr. J. C. Elvy (secretary of the Association) then read a paper on "The Use of Storage-Battery-Type Electromobiles; in its course he quoted a statement of the President of the Institution of Electrical Engineers to the effect that it was "doubly regrettable that a form of transport which avoided the importation of fuel from abroad and which positively improved the load factor was so neglected in this country." Electromobiles were destined to become the prevailing type for town transport, and charging stations would have to be provided to some extent in anticipation of the coming demand in every town. Nerve specialists and medical experts were agreed as to the evils of present-day road transport. Again, what better agency than electricity could one find for propelling pleasure boats? Bathers at seaside resorts would welcome the absence of oil and fumes. Turning to another class of marine work, the silent action of electric craft would appeal to river and waterway vigilance police patrols. Electromobiles in the form of trucks in warehouses, docks, railways, and factories had already proved an unqualified success. Reverting to town transport, it could not be denied that the electromobile was the ideal for pleasure and business, passengers and goods. It was suitable for practically every class of business—for, amongst others, provision distributors, bakeries, laundries, breweries, chemists, and door-to-door deliveries and collection in streets. The German Post Office had scrapped hundreds of horse vans in favour of electromobiles. As regards price, maintenance, and running costs, they could be regarded as having established their ascendancy over other types of vehicles in the case of town traffic. By means of their more extended use, petrol would be conserved for civil, naval, and military aviation, where its objectionable features were not so pronounced. The reason for the low rate of depreciation in the case of electromobiles was not far to seek when one considered the multiplicity of working parts and the intense vibration of a petrol engine, which resulted in the crystallising of the metal work of the chassis and general deterioration of the whole vehicle. The advantage of electric power for accelerating was evident to anyone observing the progress of a steam train, with all its fussiness, compared with an electrically-propelled train, when both started simultaneously from a station. The medical profession would find the electromobile ideal for ambulance and general visiting work; there would be no delays occasioned by difficulty in starting, or troubles due to frozen radiators and water jackets. Electric taxicabs were successfully used abroad, and they were a commercial possibility in this country; it had been reported that in Berlin another 500 such taxicabs were being placed on the streets. Signs were not lacking that the world was passing from the petrol age to the electrical age in matters of transport.

After the reading of the paper, a long and interesting discussion took place, mainly directed, at the suggestion of the chairman, not to the advantages of electrically-propelled vehicles, but to endeavouring to discover the obstacles in the way of their wider use.

The Electrical Clinometer.

Prof. Henry Briggs gave a lecture and demonstration on "Surveying Boreholes by Electrical Clinometers" to the Scottish Division of the Institute of Mine Surveyors at the close of the annual business meeting held recently in Edinburgh. He alluded to the growing need of very precise means of measuring small deflections of boreholes from the vertical, giving instances of cases in which boring engineers had been required not to exceed a deflection of half an inch per 100 ft. of depth. The fact that the holes were of small diameter made it essential that instruments should be evolved which would descend the hole, the indications being transmitted to the surface of the ground, where the observations were taken. One of the instruments demonstrated was designed for trench warfare purposes, and it enabled the course of a more or less horizontal hole to be ascertained to within about seven minutes of arc.

The Institution of Electrical Engineers.

Annual Dinner and Reunion in London.

THE annual dinner of the Institution of Electrical Engineers was held on February 10th at the Hotel Cecil, London. Applications from members to attend were received in such large numbers that all the tickets were soon disposed of, and none could be issued to non-members, other than the official guests. H.R.H. the Prince of Wales, K.G., was the guest of honour, and Dr. W. H. Eccles, F.R.S., president, occupied the chair; the company numbered 619, only seven ticket holders being absent.

Following the loyal toasts, proposed by the Chairman, the "Institution of Electrical Engineers" was toasted by the Prince of Wales, who remarked that he owed a debt of gratitude to electrical engineers: last year as president of the British Association he had to deliver a very lengthy address, at the end of which Lord Balfour expressed the hope that his year of office would be marked by some striking scientific achievement. Months went by and nothing seemed to happen, and he began to feel that his presidential year was doomed to failure; and then, about a month ago, came the very sudden announcement that, as a result of the labours of electrical experts in this country and in the United States of America, the Atlantic had been finally bridged by wireless telephony, and to-day anybody in Great Britain could (at a price) call anybody in America whenever he cared. He was confident that before next August some of those present would produce triumphs which would be no less epoch-making; when one read of the excitement that was aroused by the opening of the first transatlantic cable, it seemed surprising how calmly everybody had accepted this wonderful achievement of being able to call up the United States of America. In the presidential address to which he had referred, he pointed out that, though the period of preparation by research before science could offer the world some new benefit might be long, yet the scientific machine was always running quietly in the laboratory. They knew, and he knew, as the general public could never know, the amount of hard work and brain-power expended in keeping that machine running, and when it finally produced some striking invention for the use of civilisation, those behind the scenes could appreciate, as no outsider could, the difficulties which had been overcome and the patient skill which had been exercised over a period lasting, perhaps, many years. Individual effort, by itself, would not keep the machine running smoothly, and were it not for the existence of the various scientific and technical institutions, it might even come to a standstill; that emphasised the value of the Institution. It bridged the great gulf between pure science and practical science, and it was up to the great industries to take up and use what electrical engineers invented, and also up to the community to try them out.

The President, Dr. W. H. Eccles, in responding, said that the Institution, which numbered nearly 13,000 members, was very closely in touch with every electrical activity of the country, and the speech of His Royal Highness was a compliment to the present status of the whole profession and recognition of its rising prestige. The growth of the electrical industry in this country, and in the Empire, had been indeed remarkable: in less than a century the capital invested had risen from nothing at all to no less a sum than about one thousand millions sterling. There were men with them that day who could remember the beginning and the time when electrical engineers were of no importance at all. The growth of heavy-current electrical engineering might be measured by the fact that more than seven hundred millions sterling was invested in the electrical equipment of this country. If the economic forces calling to-day for the wider use of electricity in mills and factories were given free play, that capital outlay would probably be doubled within the next twenty years.

For many of them the immediate question was: Could Britain, which was the workshop of the world during the steam age, take a leading place in the expanding electrical age? The question could be answered by glancing at the electrical record of the past year or so. Last year Englishmen laid in the Pacific the longest submarine cable in the world of the most modern type; the Post Office opened its wireless station at Rugby, and "beam" service with Canada had been opened successfully; in design and construction those stations were far in advance of foreign practice. Lastly, a transatlantic telephone service had begun. That was their telegraph record for one year. Next, in respect of electricity supply, several big organisations had installed new plant more efficient than any other in Europe, though not quite up to some of the exceptional plant in America. Statistical returns showed that this country was leading in the electrical export trade of the world, and manufacturers booked orders in 1926 amounting in value to twenty millions sterling. Thus they might claim that their electrical capabilities as a nation were proved.

Dr. S. Z. de Ferranti remarked that "Our Guests" on that occasion were so many, so distinguished, and time was getting so short, that he could not refer to them in the way he would like to do. To Prof. C. Fabry, president of the Société Française des Electriciens, they wished to convey, and asked him in turn to convey them to his Institution, their very best wishes and hope that it would progress and flourish. The Minister of Transport, the Rt. Hon. Wilfred Ashley, had done a great amount of work in connection with the new Electricity Act; owing to legislation in the past, and various other reasons, electrical development had not gone along the lines many of them would have wished: an endeavour was now being made to straighten this out. The technical difficulties did not appear to him to be serious, but there were no doubt great difficulties in reconciling all the divergent interests and getting everybody to work together for the common good. Their principal guest that evening they were more than delighted to have with them; his presence was the recognition of a great industry, and also a personal encouragement to every one to give the best possible electrical service to the country at large.

Lt.-Col. Wilfred Ashley, Minister of Transport, in responding, said that in this country intense loyalty to the Throne was fortified by admiration for the King's eldest son. He was a man who did not shirk hard work and who had travelled to good purpose. The Electricity Act had caused other members of the Government and himself a good deal of trouble last year; there might be some who questioned the wisdom of its provisions, but the answer was provided by the President, who had pointed out that manufacturers in this country exported no less than twenty million pounds worth of goods overseas during the discussion on the Bill: now that it had become an Act, they hoped that amount would be quite doubled. On the chairman and on the members of the Board would depend largely the success or failure of the Act, and he hoped that the selections he had made, after many consultations and deliberations, commended themselves; above all, they would endeavour to carry the several interests with them rather than to compel those interests to come into the scheme against their wish. It now rested with all interested in electricity to sink petty differences and to come together.

Prof. Ch. Fabry (President, Société Française des Electriciens), on rising to respond, said it was a very agreeable duty to express best thanks on behalf of the Société for the invitation accorded to its President. When he crossed the Channel he was impressed by superficial diversities between this country and his own, but after a few minutes' talk with scientific and technical men he was much more impressed by the similarity of their ideals, which was especially true of their two societies. Forty years ago his Society decided to award a medal of renown to a distinguished man for work on pure and applied electricity. The medal was awarded once every three years, and on February 4th, by a unanimous vote, it was awarded for the present year to a man who was not an engineer, but every electrical engineer knew what he owed to Sir Joseph J. Thomson.

During the dinner the British Imperial Orchestra rendered a selection of music. The Prince of Wales subsequently joined in the members' reunion in the Victoria Hall. Those present included Lord Southborough, Lord Rayleigh, Viscount Falmouth, Sir S. Chapman (Secretary, Board of Trade), Mr. A. M. Samuel (Secretary, Department of Overseas Trade), Sir R. T. Glazebrook, Marshal Sir H. M. Trenchard (Chief of Air Staff, Air Ministry), Sir W. H. Bragg, Sir E. Rutherford (President, Royal Society), Sir J. Snell (chairman, Electricity Commission), Sir J. Devonshire, Sir J. Cook (High Commissioner, Australia), Rear-Admiral Sir A. E. M. Chatfield (Controller, Admiralty), Hon. J. S. Smit (High Commissioner, South Africa), Rev. W. F. Norris (Dean of Westminster), Sir W. P. Rylands (President, Iron and Steel Institute), Sir S. Demetriadi (chairman of Council, London Chamber of Commerce), Mr. J. McNeill (High Commissioner, Irish Free State), Mr. E. F. C. Trench (Vice-President, Inst. C.E.), Sir T. H. Holland (Rector, Imperial College of Science), Sir G. E. P. Murray (Secretary, G.P.O.), Col. T. F. Purves (Engineer-in-Chief, G.P.O.), Sir G. Hume (chairman, L.C.C.), Sir Hugo Hirst, Sir F. Heath (secretary, Dept. of Scientific and Industrial Research), Major-Gen. H. F. Thuillier (Director of Fortifications, War Office), Sir J. E. Petavel (Director, N.P.L.), and the presidents of the leading Institutions and Societies.

Correspondence.

Electricity Supply Tariffs.

In the articles on the above subject which appeared in your issues of January 28th and February 4th, Prof. W. Cramp hardly does justice to British electricity supply undertakings when he compares their charges with the charges made in Switzerland for similar supplies.

He says that in Basle an engineering works with a load factor of 20 per cent. and a maximum demand of 1,000 kW would pay 0.86d. per unit, and that "most English undertakings would charge at least 1.2d. per unit," although in Darlington the charge for such a supply would be 0.66d. per unit. He also mentions a case of a works requiring four million units per annum, with a load factor of 50 per cent., and gives the price in Basle as 0.68d. per unit, and in this country as 0.91d. per unit, whereas the charge in Darlington, under such conditions, would be 0.42d. per unit. Surely the British prices quoted by Prof. Cramp are not representative.

For household cooking the Swiss charge is said to be 0.768d. per unit, for an off-peak load supply and with a special meter at a rental of 3s. per quarter. The Darlington charge for a cooking supply, assuming that it is not used more in winter than summer, is 0.75d. per unit, without any peak-load period restriction, and with a meter rental of about 1s. 6d. per quarter.

The Swiss charge for domestic lighting is given as 5.3d. per unit during peak-load periods, and 1.92d. per unit during the remainder of the day, the peak load periods amounting to 8 hours per day in winter and 3½ hours per day in summer. In Darlington the lighting charge is 1.5d. per unit for 8 months of the year, *i.e.*, February to October, and one-half the number of units used during this period is supplied at 1.5d. per unit during the darker four months, the remainder of the units used during the darker four months being charged at 3½d. per unit. In addition, there is a service charge of 2s. 6d. per quarter, which includes the rent of one meter. The average cost of domestic lighting (not lighting and cooking or heating) is about 2d. per unit, plus the service charge. The average cost per unit for lighting in Switzerland is not given in the above-mentioned articles, but apparently it will amount to about twice as much as in Darlington.

The standard charge for low-pressure power supply in Darlington is £3 per kW of maximum demand per annum, plus 0.25d. per unit (no coal price or other adjustment), and this is the rate at which the above costs per unit have been calculated. There is also an alternative power rate for small, or low-load-factor, consumers of 1d. per unit for the first 3,000 units per quarter and 0.75d. for the remainder. The heating and cooking rate is similar in form to the lighting rate, but the lower charge is 0.75d. instead of 1.5d. per unit, and the higher charge is 1.25d. instead of 3.5d. per unit.

As electricity is being supplied at the above rates from a comparatively small power station which has been built up by gradual extensions during the last 26 years, and which has no water power, or waste heat, or linking-up arrangement, or even a natural supply of condensing water, and is situated where coal is not as cheap as in many industrial districts, there does not appear to be any good reason why electricity should not be supplied in most towns in this country at lower prices than those given by Prof. Cramp for Switzerland, and without the use of time switches.

The time-switch system of charging has obvious advantages, but it is to be feared that, in this country, the cost of providing and maintaining and attending to the time switches would more than neutralise their advantages, except in special cases.

The seasonal system of charging, referred to above, is, of course, an attempt to obtain most of the advantages of the time-switch system without the cost of additional apparatus. With this system the average charge per unit to consumers whose demand occurs during the winter peak-load period, usually falls as their load factor rises, and when a lighting demand does not occur during the winter peak-load period it is usually from a consumer who uses electricity as much in the lighter as in the darker months and consequently the average charge per unit to such a consumer will be low. Also, the average charge per unit to a cooking consumer who takes a supply regularly all the year round is lower than to a heating consumer who only uses electricity during cold weather.

J. R. P. Lunn,
Engineer and Manager,
CORPORATION ELECTRICITY DEPARTMENT.

Darlington, *February 7th*, 1927.

I notice on page 166 of the ELECTRICAL REVIEW, February 4th, in the very interesting article of Prof. W. Cramp on "Electricity Supply Tariffs" at Basle, Switzerland, that, under the charges for cooking, the householder rents a special meter for recording energy used for cooking purposes at about 1s. per month, *i.e.*, 12s. per year. He has to pay 2.4d. per unit between 6.30 a.m. and 9 a.m., *i.e.*, current used for cooking breakfast; he also has to pay the same price per unit for current used between 4.30 p.m. and 8 p.m., when, even if a full dinner is not cooked, most consumers would cook fish or something light, and during other hours when, in the majority of homes, there is little cooking done because the breadwinner and most members of the family are away from home, he gets current at a little over ¾d. per unit.

Prof. Cramp then asks: "Who would cook by gas if we had such a tariff here?" I think it might safely be said that everybody would. Most supply undertakings, without any restriction whatever as regards hours, are to-day supplying current for cooking and heating purposes at from 1½d. down to 1d. per unit with, in most cases, no meter rent, but it must be borne in mind that British undertakings generally do not charge, as the Swiss appear to be doing, a price of approximately 2½d. per unit for current when, in practice, cooking is usually carried on.

After having made this little criticism, I would like to emphasise how very interested indeed I have been in the article, and I think the thanks of the industry generally are due to Prof. Cramp for having taken the trouble to translate the electricity supply tariff of a typical town of Switzerland and for placing the matter so well before us.

While electricity supply undertakings in both countries are, no doubt, very desirous of improving load factor, the principles on which we are working in this country to attain that end appear to be quite at variance with the Swiss idea.

In Switzerland, apparently in order to induce consumers to improve the load factor of the undertaking, they have many different and sometimes complicated systems of charging, involving a multiplicity of metering equipments. Here I think there is a strong tendency to simplify the methods of charging and reduce the amount of capital outlay on apparatus on consumers' premises.

J. T. H. Legge,
Chief Engineer, SHROPSHIRE, WORCESTERSHIRE AND STAFFORDSHIRE ELECTRIC POWER CO.

Smethwick, *February 8th*, 1927.

I have read with much interest Prof. W. Cramp's article entitled as above, appearing in your issue of the 4th instant, but there is one point which I cannot pass over without comment.

On page 165, he gives particulars of a highly attractive load, from the point of view of a supply undertaking, for which the best terms that could be obtained worked out at 0.91d. per unit, with coal at 12s. 6d. per ton. The author adds: "the corresponding charge in Basle would be, at the most, 0.68d. *No more need be said.*" (The italics are mine.)

The inference is, I take it, that current for such a load is more costly in this country than in Switzerland.

Prof. Cramp has certainly been unfortunate, but if he will offer the same load in Yorkshire, he will have no difficulty in obtaining the required supply from any one of the leading supply authorities, such as Leeds Corporation, Sheffield Corporation, or the Power Company, at a price not exceeding 0.52d. per unit, with coal at 12s. 6d. per ton.

R. Allan S. Thwaites.

Leeds, *February 7th*, 1927.

A Knotty Problem.

As one of the general public of a small town where a supply of electricity has recently become available (at 230 volts, d.c.), I desire to avail myself of the advantages of electricity, and asked three contractors to estimate for the wiring of my business premises (draper and outfitter). My property is rather old, and I should require forty lights installed.

The estimates I received were consistent, but each contractor specified a different wiring system, each claiming that his own was superior. Also two consultants varied in opinion, so how am I, without experience of the technical details and difference of the many systems used, to choose between them and get the best?

Could you, please, give your valued opinion?

As far as I can ascertain, screwed conduit is universally accepted as the superior job; but where do "grip conduit," "C.T.S.," the many lead-covered systems, and "Maconite" stand? In what order should they be placed, electrically, irrespective of costs? If there is nothing to choose between them, why so many? I should be pleased if you would give this letter publicity in your correspondence columns.

Perplexed.

February 10th, 1927.

River Water—or Cooling Towers?

Mr. J. N. Waite refers to fig. 2 in Mr. I. V. Robinson's and my book on "Condensing Plant."* The figure in question gives in curve form approximately comparable values of varying vacua for varying inlet water temperatures. I agree that the curves do not show a great variation from Mr. Waite's figures; but I had in mind, in questioning Mr. Waite's figures, a calculation in which due allowance was made for the respective capital charges, &c., of a riverside installation and a cooling-tower plant. I based my difference of approximately 1 per cent. due to additional circulating-pump power consumption in favour of the river plant on a 10,000-kW unit allowing some 6 per cent. more water for the higher

* "Condensing Plant," by R. J. Kaula and I. V. Robinson. Messrs. Isaac Pitman & Sons, London.

vacuum and 25 feet additional head for the cooling towers, and arrived at an additional power consumption figure of 75 to 80 kW.

However, the main point at issue between us relates to the question of relative turbine efficiencies.

As far as I am aware, the turbine makers' decision to confine their guarantees to one set of terminal conditions—and this applies to the inlet conditions as well as to the exhaust conditions—was based on what appeals to me as very sound reasoning, namely, that the conditions for such a vitally important guarantee should be clear cut and unequivocal. It is open to a prospective purchaser to call for alternative tenders for two units, each designed for its respective vacuum, and he will then be able to determine the practicable thermal gain due to the lower temperature of cooling water in respect of the turbine, and I repeat that he will find the difference to be of the order of 7 to 8 per cent. on full load, and not of 4 per cent. as Mr. Waite suggested. That is to say, the thermodynamic efficiency of the two units will be practically the same. If he bases his comparison as Mr. Waite is doing on one turbine designed for one condition and run under another condition, he will get misleading results. A turbine designed for a back pressure of 1.2-in. Hg is obviously too small to be run efficiently on a back pressure of 0.9 in. Hg, and a turbine designed to work on 0.9 in. Hg is too expensive to be installed for a back pressure of 1.2 in. Hg.

I am of the opinion that Mr. Waite has arrived at a false conclusion to some extent by relying on comparative tests carried out on the same units, but mainly so by relying on tests carried out on turbines that represent conditions of the past rather than those of the present when dealing with a rapidly progressive form of machinery.

R. J. Kaula.

Erdington, *February 7th*, 1927.

Power Supply for Wireless Sets.

In reply to the further letter of "Interested," in your issue of February 11th:—

(1) As to whether I admit the competence of an eminent musician to judge by ear the quality of a set: This depends entirely on circumstances. If any person, musical or otherwise, gave an opinion based simply on listening to a set, I would not accept it for a moment. If several musical people listened to *two* sets, with facilities for instant change-over, I would accept their statement that one was better than the other. If they classed them as equal, I should admit that the difference between them was not more than 33 per cent. in amplitude of any frequency that the loud-speakers in use could reproduce.

(2) On his amended statement, that he is getting reproduction pleasing to himself and professional musical friends with his apparatus, I have no comment to offer, except that one cannot usefully discuss in the ELECTRICAL REVIEW matters of musical taste.

(3) Regarding the makers of his apparatus, I gather from his letters that his set is made by the Western Electric Co. that was—now Standard Telephones and Cables, Ltd.; and that, because my employers have standardised that firm's cone loud-speaker, I am to admit the high quality of his set without proof, on the ground that the Standard Telephones made it. With the best will in the world towards Standard Telephones, I will make no such admission. I believe that the Kone loud-speaker is really good, because I have tested it. I am sure that Standard Telephones *can* make an exceptionally good receiver; but I have not tested any of their receivers, and I do not know how long ago "Interested's" set was designed, nor whether it was designed for first-class loud-speaker work as that is understood to-day. The assurance of some of my acquaintances on the engineering side of that company would go a long way towards convincing me, if "Interested" could obtain them.

(4) I must congratulate "Interested" on a neat touch of humour in his sentence about "museum specimens." None the less, I would advise him to go and listen to that particular specimen—it might be an education in how wireless sets ought to sound.

(5) As to the word "distortionless," unfortunately I have not at hand a copy of my letter of January 7th. Perhaps I used the word loosely to mean "substantially distortionless." I took him up on the point because he claimed his set to be "*absolutely* distortionless," which it certainly is not.

(6) Twice your correspondent refers to me as "laying down the law." This is a misuse of the phrase. I was stating a fact accepted by those who have studied the subject. Does a book on geography "lay down the law" when it states that the world is round?

(7) His final contention is at last a claim which can be tested; that he can, with 0.75-watt d.c. on the anode in his set, get results equal or superior to those obtained with other receivers with 4 watts.

This I can take up. It is self-evidently an absurd contention, but if he persists I am prepared to discuss conditions for a trial, and I should be grateful if you, Sirs, would assist in such discussion. Apart from matters connected with such a test, I do not propose to continue this correspondence.

P. K. Turner.

Blackheath, *February 12th*, 1927.

A Handicap to Electrical Progress.

In view of the wonderful efforts that are being made in England to popularise the uses of electricity, the following facts may be of interest.

A relative of mine, an important salaried official of one of the large insurance companies, moved lately to Leicester. He was fortunate enough to be able to lease a house equipped both for gas and for electricity.

On going to the Gas Department (municipal) to get his cooker connected up, he was asked for £4 deposit. On his protesting, this was reduced to £2, which he paid.

On going upstairs to the Electricity Department and asking to have his house connected up, he was asked for a deposit of £5. No amount of remonstrance reduced this sum, and on his insisting on seeing an official of authority he was informed that the only concession that could be made was the substitution of a guarantee by a responsible ratepayer. As a stranger, this course was not open to him, and in disgust he decided to use gas, which he does.

The house in question is wired for 12 lamps at the outside, so a reasonable quarter's account might be £2 10s. This makes a £5 deposit sound very silly. In fact, as a publicity story, this incident is such a pearl that one can only hope that the Corporation, by these benighted methods, makes up on the gas swings what it loses on the electric roundabouts, and recompenses its gas manager accordingly.

Ivan Fawcett.

Cardiff, *February 11th*, 1927.

The Tricity Restaurant.

To-day I lunched at the Tricity Restaurant, and would like to congratulate the proprietors on the excellent—indeed, magnificent—way in which the place is equipped and run. The carpet, the lighting, the warming, the service, and the cooking are all splendid—*but* is it equally splendid as a piece of propaganda?

It would be if England were chiefly populated by well-off people, instead of by rather badly-off strugglers. I feel sure that if one of these moderately poor citizens were to visit this restaurant he would be confirmed in the still prevalent opinion that electric cooking can only be afforded by the immoderately rich.

I spent 4s. 1d., plus 7d. in tips, for the following:—

About 6 oz. of consommé,
5 oz. of sole (in 2 oz. of sauce),
2 cu. in. of potato chips,
2 small rolls.

This works out at about 5.28 shillings per pound, and I was still hungry, so I bade a reluctant farewell to Lucullus and visited a near-by temple of Bacchus, where bread and cheese provided the necessary calories at a much more modest cost per unit.

Who will start an electric restaurant to demonstrate what can be done at prices which the majority of prospective consumers can afford to pay?

M.I.E.E.

Westminster, *February 11th*, 1927.

[An electric restaurant at popular prices was opened last year in Ludgate Hill by the City of London Electric Lighting Co., Ltd., in connection with its showrooms.—EDS. ELEC. REV.]

Local Exhibitions and the Public.

Your comments on the above subject in your current issue are very timely. It is to be hoped that they will be read and followed by those demonstration engineers who, apparently, cannot conceive of any method of impressing the layman other than attempting to "blind him with science."

Once an interested visitor to an exhibition has had a piece of apparatus demonstrated to him, the only other material consideration, from his point of view, is one of £ s. d. In this connection a very simple indicating device can be used which makes an immediate appeal to the prospective customer. This device consists of an ordinary ammeter, without ampere scale, but scaled to read in "pence-per-hour," thus giving an instant indication of the cost of using any piece of apparatus demonstrated.

The system is equally applicable to a.c. and d.c. supplies as, in the former case, consuming devices taking any appreciable current would be a unity power factor load.

The instrument is not expensive since most manufacturers would be prepared to supply it at the price current for an ordinary ammeter of the same capacity, and there is no doubt that a visible indication of the cost of using any piece of apparatus is not only more convincing than a verbal one, but constitutes another revelation to the visitor of "the wonders of electricity."

Frank Rostron.

Oldham, *February 11th*, 1927.

[The device referred to by our correspondent is certainly effective, and should not be much more costly than an ordinary ammeter. It has already been employed, but its use could be extended with advantage.—EDS. ELEC. REV.]

Legal.

Carlton Main Colliery Co., Ltd.

MR. JUSTICE ROMER, on February 11th, had before him a petition by the Carlton Main Colliery Co., Ltd., Barnsley, Yorks., for sanction to an extension of its objects, one of which was to take powers to conduct a general electricity undertaking.

His LORDSHIP said that in his view the powers asked for were too wide. If the company had the statutory powers which he learned that it was applying for elsewhere, it would be able to go to London and pull up the streets there, provided it got the consent of the local authorities. He did not think that that was what the company wanted, and he would adjourn the petition for evidence to be produced as to the powers being asked for. He suggested that the company should confine those powers to what it really wanted.

The petition was adjourned for 14 days.

British Thomson-Houston Co., Ltd., v. G. Clynes & Co.

MR. JUSTICE ROMER, in the Chancery Division on February 9th, heard a motion by the British Thomson-Houston Co., Ltd., for an injunction restraining Messrs. G. Clynes & Co., Leeds, from infringing its leading-in wire and gasfilled lamp patents.

Evidence was given that the necessary papers were served at the address given as the defendants' address, and that a representative of the plaintiff company bought lamps that were said to be an infringement of the plaintiffs' rights. But an affidavit was also read by a woman named Brown that there was no such company as that of the defendants.

His LORDSHIP, in the absence of any further evidence for the defence, granted an injunction against Clynes & Co.

Electricity Theft Charge Dismissed.

IN the Falkirk Sheriff Court, last week, judgment was given in a case in which a local publican was charged with the theft of electricity from the Falkirk Corporation by altering the index of the meter and preventing it registering the quantity supplied.

Sheriff ROBERTSON said that the Electric Light Order, 1901, under which the charge was brought, presumed the existence of some artifice or device to prevent correct registration by the meter. As the prosecution had not shown that such an artifice or device had been used by the defendant he must find the charge "Not proven."

Compensation for Marconi Company.

IN the High Court, Dublin, last week, Marconi's Wireless Telegraph Co., Ltd., appealed against a reinstatement clause in an award of £4,640 made in its favour by a county court judge. The matter related to the destruction of the appellants' Clifden wireless station in 1922, and the company now stated that it did not propose to continue the station, and would accept £2,000 in lieu of reinstatement. The award was varied by allowing the company an extra £2,050. The Galway County Council, against which the award was made, was given leave to appeal to the Supreme Court.

Published Specifications.

Compiled expressly for this journal by a firm of Chartered Patent Agents. The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1925.

13,948. "Replacement type electric fuses." G. P. Dennis. March 1st, 1926. (264,217.)

18,579. "Radio-frequency amplification systems." A. E. White (Thermiodyne Research Laboratories, Inc.). July 21st, 1925. (264,304.)

22,801. "Electric switches." F. B. Cox. September 12th, 1925. (264,552.)

23,115. "Electric telegraphs." H. Pein. September 16th 1925, (264,553.)

23,567. "Automatic switches for use in telephone or like systems." Automatic Telephone Manufacturing Co., Ltd. (Automatic Electric Co.). September 21st, 1925. (264,556.)

23,792. "Telephone systems." Automatic Telephone Manufacturing Co., Ltd., and J. E. Ostline. September 23rd, 1925. (264,557.)

25,853. "Electric switches." J. A. Crabtree. October 16th, 1925. (264,564.)

25,906. "Telephone systems." Standard Telephones and Cables, Ltd., A. M. Searle, J. H. E. Baker, A. H. Cameron, W. R. Moscrip, A. J. Chanter and P. I. Wyndham. October 16th, 1925 (264,565)

26,094 "Composite welding-sticks for electric arc welding." W. J. Mellersh-Jackson (Soudure Autogene Francaise). October 19th, 1925. (264,571.)

26,106. "Aerial systems for use in wireless telegraphy and telephony." C. S. Franklin and E. Green. October 19th, 1925. (264,572.)

26,133. "Thermionic valves." Edison Swan Electric Co., Ltd., and T. W. Price. October 19th, 1925. (264,576.)

26,206. "Electric heating elements." Bastian Meter Co., Ltd., F. J. C. Allen, and A. E. Salisbury. October 20th, 1925. (264,581.)

26,219. "Electrical inductance coils and the manufacture thereof." Coto-Coil Co. August 31st, 1925. (257,564.)

26,335. "Telephone systems." Standard Telephones and Cables, Ltd. (Bell Telephone Laboratories, Inc.). October 21st, 1925. (264,593.)

26,362. "Variable condensers." B. Hesketh. October 21st, 1925. (264,595.)

26,379. "Systems of radio broadcast distribution." E. F. Colladay. October 28th, 1924. (242,266.)

26,418. "Variable capacity electrical condenser." F. E. Bancroft. October 22nd, 1925. (264,598.)

26,481. "Electrical measuring instruments." C. Bornmann. January 14th, 1925. (246,104.)

27,113. "Method of making high-resistance units." Dr. S. Loewe. November 6th, 1924. (242,625.)

27,275. "Current-limiting devices." W. J. Davis and T. F. Stent. October 30th, 1925. (264,605.)

27,759. "Secret telegraphic, telautographic, and photo-telegraphic wire or wireless systems." Soc. des Etablissements, E. Belin, and E. Belin. November 4th, 1925. (264,611.)

27,991. "Switching apparatus for telephone systems." Automatic Telephone Manufacturing Co., Ltd., J. Savin, and R. E. Boyd. November 6th, 1925. (264,616.)

28,068. "Electrically-driven pumps." L. S. J. Thompson and Mather and Platt, Ltd. November 7th, 1925. (264,619.)

28,293. "Electric signalling." A. J. King and Metropolitan-Vickers Electrical Co., Ltd. November 10th, 1925. (264,621.)

28,333. "Regulatable shunt motor for alternating-current with rotatable commutating poles." J. Sousedik. November 10th, 1925. (264,622.)

29,450. "Electric telegraph transmitters." G. Miniotti. November 22nd, 1924. (Addition to 189,267.) (243,386.)

30,907. "Anode batteries." J. Lewy. December 6th, 1924. (244,127)

30,908. "Anode batteries composed of pocket-lamp batteries." J. Lewy. December 6th, 1924. (Addition to 244,127.) (244,128.)

31,765. "High-frequency signalling systems." British Thomson-Houston Co., Ltd. January 27th, 1925. (Patent of addition not granted.) (246,808.)

32,214. "Method of increasing the ohmic resistance of pure iron, especially electrolytic iron." Siemens & Halske Akt. Ges. January 9th, 1925. (245,753.)

1926.

2,265. "Attachment means for lamp casings." British Thomson-Houston Co., Ltd., A. P. Young, and A. G. Salisbury. January 26th, 1926. (264,659.)

3,137. "Automatic electric devices influenced by direction of current flow." English Electric Co., Ltd., and A. R. Blandford. February 3rd, 1926. (264,666.)

4,499. "Telegraph and telephone conductors." A. Davidson and E. S. Heurtley. February 17th, 1926. (264,675.)

5,188. "Transformers." Johnson-Williamson Laboratories, Inc. April 11th, 1925. (250,544.)

7,231. "Transformer coils." R. S. Handelmaatschappij, Stokvis & Zonen. February 2nd, 1926. (264,685.)

7,789. "Arc-rupturing devices." Metropolitan-Vickers Electrical Co., Ltd. (Westinghouse Electric and Manufacturing Co.). March 20th, 1926. (264,363.)

7,937. "Alternating-current motors." Himmelwerk Akt. Ges. March 23rd, 1925. (249,565.)

9,086. "Electric discharge tubes." Naamlooze Vennootschap Philips' Gloeilampenfabrieken. April 18th, 1925. (250,928.)

9,191. "Correcting devices for use in synchronous telegraphy." Muirhead and Co., Ltd., F. H. Muirhead, E. S. Heurtley, and J. V. Foll. April 7th, 1926. (264,694.)

9,951. "Electric induction furnaces." J. R. de Zubiria. April 29th, 1925. (251,608.)

10,069. "Electric current converting systems." British Thomson-Houston Co., Ltd. April 18th, 1925. (250,965.)

10,529. "General arrangement of electric condensers." M. Sieverts Fabriks Aktiebolag. May 15th, 1925. (252,137.)

11,439. "Electric power transmission systems." British Thomson-Houston Co., Ltd. April 30th, 1925. (251,653.)

11,864. "Electrodes for electric furnaces." Norske Aktieselskab fur Elektrokemisk Industri. May 15th, 1925. (252,153.)

12,273. "Electrically-heated warming-pan." H. Höck and G. Höck. May 12th, 1926. (264,713.)

12,411. "Stopping devices for electric lifts." J. Mair. May 14th, 1926. (264,714.)

13,824. "Electrically-operated hammers and the like." A. Soulier. June 2nd, 1925. (253,110.)

14,066. "Electric discharge devices." British Thomson-Houston Co., Ltd. June 3rd, 1925. (253,126.)

14,363. "Automatic ignition circuit cut-out and lubricating-oil short-supply alarm attachment for automobile engines." E. A. M. Gibson. June 7th, 1926. (264,725.)

14,480. "Loud-speaking telephones." Lissen, Ltd., and R. P. Richardson. June 8th, 1926. (264,726.)

15,431. "Armouring for single-core alternating-current cables." Felten and Guilleaume Carlswerk Akt. Ges. October 10th, 1925. (259,536.)

15,637. "Vibrating diaphragm for sound recording and reproducing apparatus." P. G. H. D'Amour. June 20th, 1925. (253,943.)

16,768. "Headlights for motor vehicles and the like." A. Ringham. July 5th, 1926. (264,391.)

16,977. "Radio receiving systems." Standard Telephones and Cables, Ltd. July 7th, 1926. (264,392.)

17,005. "Multicore high-tension cables." Pirelli & Co. September 2nd, 1925. (257,895.)

18,949. "Acoustic diaphragms." L. Lumiere. August 1st, 1925. (256,252.)

19,033. "Acoustic diaphragms." L. Lumiere. September 28th, 1925. (Addition to 256,252.) (258,842.)

22,540. "Lead cable presses." F. Krupp Grusonwerk. Akt. Ges. October 13th, 1925. (259,934.)

22,647. "Thermionic tubes." British Thomson Houston Co., Ltd. October 8th, 1925. (259,550.)

23,119. "Electric insulators." J. Wilfort. September 20th, 1926. (264,758.)

23,835. "Electric motor combined with a rotary air suction or compressing device." G. O. Lehmann and A. Borsig Ges. September 27th, 1926. (264,422.)

24,405. "Device for rectifying alternating current." Naamlooze Vennootschap Philips' Gloeilampenfabrieken. October 7th, 1925. (259,565.)

25,744. "Generating systems for high-tension electric currents." G. T. Thurneyssen. October 16th, 1925. (259,986.)

28,543. "Means for the electric ignition of internal-combustion engines." J. Bethenod. November 18th, 1925. (261,738.)

29,339. "Globe fittings for electric lamps." A. Chalmers. November 20th, 1926. (Cognate application 29,593/26.) (264,437.)

29,730. "Electric welding devices." International General Electric Co., Inc. November 24th, 1925. (262,112.)

31,005. "Electrical welding machines." E. G. Budd Manufacturing Co. December 7th, 1925. (262,484.)

Trade Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from February 9th :—

Tunomophone. No. 472,414. Class 8. Radio-telephonic receiving apparatus. —M. E. Elliott, The Thistles, Kemps Lane, Beccles, Suffolk.

The Fez Cap. No. 473,332. Class 8. Radio telephonic apparatus.—M. Lyon, Sudbourne Hall, Orford, Suffolk.

Virite. No. 476,392. Class 8. Electric cables.—Edison-Swan Cables, Ltd.

Sapian. No. 768,592. Class 13. Sparking plugs, &c.—La Société pour l'Industrie d'Accessoires, Paris. (British representatives: D. Young & Co., 11-12, Southampton Buildings, Chancery Lane, W.C.2.)

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

ARMTHORPE.—Kinema, dance hall and billiard saloon; Garside & Pennington, architects, Pontefract.

AUDENSHAW.—Extensions, Delta Works; Mr. Austin Hopkinson, M.P.

BARNET.—Secondary school, Queen's Road; Herts Education Committee. Elementary school, Potters Road, East Barnet; Herts Education Committee. Elementary school, Underhill; Herts Education Committee.

BRADFORD.—Electrical fittings for botanical laboratory, &c., at Hanson School; education director. Proposed new club premises, with dance hall, &c. (£6,000); secretary, Idle and Thackley Constitutional Club, near Bradford.

BRISTOL.—58 houses at Woodland Way, for Corporation; Gibbs & Davies, Bissicks & Fletcher, and Roe & Gadd. Offices for Customs Department, City Docks; city engineer.

BURY.—Housing scheme (224); J. A. Settle, borough engineer.

CAMBRIDGE.—Schools, Brunswick (£43,096), for the Borough E.C.; J. Honour & Son, Ltd., builders, Tring. School (£13,024); Johnson & Bailey, builders.

CANNOCK.—Housing scheme (40), St. John's and Hunter Roads; Messrs. W. Harrison, Ltd.

CARDIFF.—Dance hall at Cathays, for Mrs. B. V. Sheppard; T. W. Price, architect, 35, Fields Park Road.

CASTLE DOUGLAS.—Electric lighting at the Town Hall; T.C.

CHEDDAR.—Reservoir, &c. (£650,000); Bristol Waterworks Co.

CHESTERFIELD.—Additional 50 houses, Highfield Hall Estate, for the T.C.; Rollinson & Sons, architects, Corporation Street. Conversion of old telephone exchange into municipal offices; Mr. Thomas Smith, Mansfield. Installation of electric lighting, Eyre Street Schools; Corporation architect.

DUMBARTONSHIRE.—New public hall at Duntocher, to cost (£4,500); clerk, Old Kilpatrick Parish Council, Dumbarton.

DUNOON.—Extensions at Hospital, including electric lighting, X-ray apparatus, and new operating theatre; medical superintendent.

EASTBOURNE.—30 houses, Hutment site; borough engineer.

EDINBURGH.—Additions and alterations at St. Anthony's School, Leith, to cost £6,400; master of works, Education Authority.

FARNHAM ROYAL (Bucks).—Factory, Buckingham Avenue, for Slough Estates, Ltd.

FOLKESTONE.—Dancing hall, Dover Road, for Lloyd Forsyth; J. L. S. Dahl, architect.

GLASGOW.—New hall in Bridgeton, for Salvation Army; Officer Commanding, Glasgow.

HARROGATE.—Electric light installation, St. Mark's Church; churchwarden.

HARTLEPOOL.—Housing scheme (42), Howard Street; borough surveyor.

HEMSWORTH.—Additional 500 houses, for the R.D.C.; surveyor.

HOOKERGATE.—Secondary school, Townley Estate, for Durham E.C.; director of education, Durham.

HORFIELD (near Bristol).—108 houses; Messrs. Jennings.

IRISH FREE STATE (Co. Tipperary).—Rebuilding Anner Castle; J. Hearne & Son, builders, Waterford.

(Dublin).—New Gallery, at Science and Art Museum, Kildare Street; T. Cassidy, secretary, Public Works.

IRLAM (Lancs.).—Works extensions, Liverpool Road, for the Hulme Patent Advertising Match Co., Ltd.

KILLAMARSH.—Housing scheme (600), for J. & G. Wells, Ltd., Eckington Colliery.

LETCHWORTH.—Secondary school, Spring Road; Herts Education Committee.

LIFTON (Launceston).—Re-erection of flour mills, for S. Coles.

LINCOLN.—Municipal offices, for the T.C.; borough surveyor. Houses (40), Doddington Road, for Horton & Co.

LIVERPOOL.—Houses (200), for the T.C.; W. H. Davey and Co., builders, Runcorn.

LONDON (Becontree, E.).—Shops on Dagenham section; Mr. J. G. Tilley.

(East Ham, E.).—60 houses, Central Estate, for Corporation; Mr. S. E. Moss.

LONDON—*continued.*

(E.C.).—Post Office buildings, Houndsditch; Postmaster-General.

(St. Pancras, N.W.).—Offices for Weights and Measures Department, Euston Road (£28,000); L.C.C. architect.

(Greenwich, S.E.).—Operating theatre, Woolwich Road Hospital, for the B.G.; William A. Pite, Son & Fairweather, architects, 12, Carteret Street, Queen Anne's Gate, Westminster.

(Lewisham, S.E.).—Large departmental stores on site of Messrs. Strouds, Ltd., premises; Royal Arsenal Co-operative Society, Woolwich, S.E.

(Shooter's Hill, S.E.).—Isolation accommodation, Brook Hospital; Carrington, Thomas & Co., Ltd., Beckenham, for M.A.B.

(Southwark, S.E.).—Shops on Tabard Street Estate, for L.C.C.; Mr. R. J. Rowley, of Tottenham.

(Woolwich, S.E.).—Additional 113 houses, for the T.C.; borough surveyor.

(W.C.).—Theatre on the Meux Brewery site, corner of Oxford Street and Tottenham Court Road; the Casino Theatre, Ltd.

LONGRIGGEND.—Sanatorium extensions, with electrical work, for Lanarkshire C.C.; P. C. Smith, architect, District Offices, Hamilton.

MALTBY.—Secondary schools, for West Riding E.C.; director of education, County Hall, Wakefield.

MARKET HARBOROUGH.—Factory extension, Little Bowden; W. Symington & Co., Ltd.

MINEHEAD.—Secondary school, for Somerset E.C.; A. J. Toomer, county architect, Lloyd's Bank Chambers, Weston-super-Mare.

MISTLEY.—Extensions at Brunswick House Asylum; L.C.C. architect.

NORTON (Stockton-on-Tees).—Kinema, Norton Avenue, for the Norton Cinema Co., Brandon.

NOTTINGHAM.—Elementary school for 1,000 at Lenton Abbey Housing Estate; Education Committee.

OCKENDON.—Mental hospital; West Ham Corporation.

PERRANPORTH (Cornwall).—Hotel on Rean Sands (£25,000); H. L. Wilson, solicitor, Truro.

PLYMOUTH.—Extensions to the South Devon and East Cornwall Hospital (£40,000); general superintendent. Electric wiring, Stonehouse Town Hall; borough engineer. 172 houses, St. Budeaux, for dockyard men; Admiralty. Proposed silo, suction plant and deep water berth; Port Development Committee.

PONTEFRACT.—Houses (500), for the T.C.; builders, J. W. Halliday, Worksop; Hibbert & Sons, Barnsley; T. W. Senior & Sons; F. W. Atkinson, Brigg; and John Stockhard, Cudworth.

PRESTWICH.—Housing scheme (50); M. A. Piercy, architect, Town Hall.

SALISBURY.—Houses (90), for the T.C.; Clarke & Co., builders.

SEAHAM.—Seaham Hall, conversion to sanatorium; Durham C.C.

SHEFFIELD.—Eighteen new schools; Education Committee. Housing scheme (158); W. G. Davies, city architect.

SOUTHPORT.—Housing scheme (56 further houses); borough engineer.

STALYBRIDGE.—100 houses, Harrison Estate; borough engineer.

STEYNING (Sussex).—Houses (56), for the R.D.C.; White and Co., builders, Haywards Heath.

STOCKPORT. — Public washhouses (£7,000), electrically equipped, for the T.C.; borough surveyor.

STOCKTON-ON-TEES.—Municipal buildings, for the T.C.; Lanchester, Lucas & Lodge, architects.

STRETFORD.—70 houses, King's Road and Ravenswood Road; Mr. W. R. Rochelle and Mr. G. A. Russell.

SWINDON (Wilts).—Houses (69), for A. J. Colborne, builder.

TAUNTON.—Maternity home, Canon Street, for the T.C.; Samson & Colthurst, architects, 1, Hammet Street.

THORNE (Doncaster).—Rebuilding works, for the British Moss Litter Co., Ltd.; John Clayton, builder.

TUNSTALL.—Extensions, Alexandra Pottery, Scotia Road; Johnson Bros., Ltd.

UPTON (Yorks).—Additional 262 houses; Housing Corporation of Great Britain, Ltd.

WATFORD.—Extensions, Girls' Grammar School; Herts Education Committee.

WELWYN.—100 houses, Garden City; R.D.C. surveyor.

WINCHESTER.—Housing scheme (42), for the T.C.; city surveyor.

The

Electrical Review

VOL. C. FEBRUARY 25, 1927. No. 2,570.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

Our Advertising Competition.

ON Thursday last week the judging took place in connection with our second advertising Competition. On this occasion the judges were:—Mr. J. W. Beauchamp, Director and Secretary of E.D.A.; Mr. W. F. T. Pinkney, of the Newcastle-upon-Tyne Electric Supply Co., Ltd.; and Mr. H. T. Young, of Messrs. Troughton & Young, electrical contractors, Knightsbridge.

In this series the subjects of the advertisements were divided into three classes, namely: Class I, generating plant, switchgear, batteries, and heavy machinery in general; Class II, fittings, switches, lamps, heating and cooking apparatus and general accessories; Class III, instruments, meters, telephones, cables and wires, and miscellaneous apparatus. The results were as follows:—

FOR THE BEST SIX FULL PAGES.

CLASS I.—*Prize*, £50. Awarded to The British Thomson-Houston Co., Ltd., Rugby, whose advertisements were prepared by Mr. A. L. M. Ayers, manager of the advertisement department.

CLASS II.—*Prize*, £50. Awarded to The Ormond Engineering Co., Ltd., whose advertisements were prepared by Messrs. Bertram Day & Co., Ltd.

A special award of £25 in this class was made to Messrs. W. T. Henley's Telegraph Works Co., Ltd., for their "ISCO" advertisement.

CLASS III.—*Prize*, £50. Awarded to The Stella Conduit Co., Ltd., whose advertisements were prepared by Messrs. H. P. Pope, Ltd., of Birmingham.

FOR THE BEST SIX HALF PAGES.

As there were not sufficient entries in each of the three classes, they were all judged as one class.

First Prize, £25. Awarded to The Varley Magnet Company, whose advertisements were prepared by Messrs. E. Walter George, Ltd., of High Holborn, London.

A special award of £15 was made to The Midland Electric Manufacturing Co., Ltd., whose advertisements were prepared by Mr. John F. Preston, of Birmingham.

The report of the Judges will appear in our next issue; in the meantime, the Directors of the Electrical Review wish to record their grateful thanks to them for the painstaking efficiency with which they carried out the difficult task of deciding the relative merits of so many excellent entries.

The Growth of the Fair.

Some idea of the remarkable progress that the British Industries Fair has made in the estimation of our manufacturers may be gathered from figures indicating the number of exhibitors in London and Birmingham this year compared with last year's total. At Birmingham the number of exhibits has increased from 400 to 600, while in London the number of firms exhibiting has grown from 600 to 900. The whole of the available space at the White City, London, has been absorbed; it is understood that the number of firms exhibiting would have been larger still but for the limitation of accommodation. At Castle Bromwich, Birmingham, the actual increase in space occupied is larger than the percentage increase in number of exhibitors. There, however, there is practically unlimited site extension accommodation at the disposal of the authorities, and the Birmingham Chamber of Commerce is prepared to add more and more buildings as the popularity of its part of the Fair grows.

It seems certain that the Government Department concerned with the future of the Fair and the Birmingham Chamber will have to consider together this important question of site and space as the Fair reaches the greater place which it seems destined to occupy in relation to our export and Home trade development. Seeing that London has reached its space limit and Birmingham has by no means done so, it might be as well to transfer some of the London trades to Birmingham next year.

Large as the Fair is to-day, the fact remains that approximately 1,500 firms is not an adequate representation considering the vast number of British manufacturing concerns who should be interested in a National Market designed to attract hosts of overseas buyers. The larger the number of firms regularly taking part, the more permanent will be the basis upon which the Fair will be built up; to that end those missing from the present demonstration would assist the authorities in making future plans by intimating their interest at an early date.

Cheapen Electricity!

The price of electrical energy is one of the most important topics of the time—and one of the most difficult to discuss without going deeply into details. No two areas of supply are alike; local conditions and the past history of an undertaking exercise great influence over the position of affairs to-day, and when we meet with anomalies, as we frequently do, it is unsafe to stigmatise them hastily and without examining the relevant facts. In this respect the supply of electricity differs fundamentally from that of gas and similar commodities, which can be produced at one time, stored, and distributed at another time; the load factor and the nature of the load must be taken into account, and the "average revenue obtained per kWh" is only part of the story.

It is true that the Weir Report, signed in May, 1925, pivoted largely upon the average price charged to consumers for all purposes, which was stated to be (in 1923) 2.047d. for statutory undertakings, relating to rather more than half the total electricity consumed in this country; the remainder probably cost much less, and the true average may have been well under 1.5d. The greatest stress was laid on the estimate that by 1940, under the conditions existing when the Report was drawn up, the average price for public supply would probably not be lower than 1.75d., and certainly not less than 1.5d., and the scheme put forward in the Report was expected to reduce the average price in 1940 (or when the consumption reached 500 kWh per head) to "1d. or under."

The Return of Engineering and Financial Statistics issued by the Electricity Commissioners for the years 1924 and 1925 showed that the revenue from sale of energy of all statutory undertakers in 1923-24 was 1.86d. and in 1924-5 1.75d.—a marked reduction in two years. It will be seen that if this high rate of progress could be maintained, by 1931 the goal aimed at by the Weir Committee of 1d. per kWh would be attained without the help of any new Act or Board. Perhaps we shall have the opportunity to witness the event, for it is generally held that the operations of the Central Electricity Board cannot produce much effect in less than five years. The revenue from power units in 1924-5 averaged 1.07d.

We repeat, then, with increased confidence, the claim that we have previously made that, on the whole, electricity is relatively cheap in this country. The same truth is proclaimed from time to time by those who visit other countries where electricity is supposed to be cheap. Nevertheless, we are far from satisfied with the position. The fact remains that the charges for lighting, and for domestic uses, are often higher than they should be. We would urge electricity supply undertakers to take their courage in both hands and offer their domestic consumers really attractive terms. They will be surprised at the result—but they will have no difficulty in balancing their accounts. They are far too cautious, and wait for the demand to reduce the price instead of reducing the price to increase the demand.

Ductile Tungsten in the United States.

It will be observed with interest that, according to a recent decision of a United States Court, the Coolidge patent for the production of tungsten wire ductile in the cold state has been declared invalid, on the ground that the ductility is a natural property of the metal and is not patentable. This decision follows that of the House of Lords two years ago, which was based on similar reasoning. Apparently the legal view was that tungsten wire, if it existed, was inherently ductile, and its production was merely the result of normal progress in the art of the metal-worker.

Apart from commercial considerations, our sympathies are with the inventor of the process which made the drawn-wire lamp practicable and effected a great forward step in the history of the incandescent lamp. The injury is aggravated by the fact that the Edison Medal for 1926 was awarded to Dr. Coolidge in December last for the origination of ductile tungsten and the improvement of the X-ray tube, and he has felt obliged to decline that great honour owing to this adverse decision. Whilst we do not question the propriety of his action in this matter, we feel that the fact is regrettable; the distinction was well earned, and it is unfortunate that the award should be nullified merely on the ground of a legal interpretation of the claims of his letters patent. Dr. Coolidge's electrical confrères are well aware of the real value of his work on the tungsten lamp, which is in no way affected by the Court's decision.

Over the Loetschberg on a 4,500-h.p. Locomotive.

Modern electric railway practice, embodying the use of a new Sécheron locomotive employing 12 motors in 6 units, and a new quill spring drive.

By THEODORE RICH.

THERE is a general impression that all the important railways in Switzerland are owned by the Federal Government, whereas there is a considerable mileage of line still owned and operated by private companies; one of the most active of these is the Bernese Alps Railway, which owns the Loetschberg Railway, as well as one route from Berne to Thun, a line from Berne to Neuchatel, and an important link between Legnau and Moutier on the Délémont-Berne line. The Loetschberg tunnel route differs from the St. Gothard and Mont Cenis routes in that it was designed from the start for electrical operation. From Spietz, where the Loetschberg section begins, to Brigue, not far from the entrance to the Simplon tunnel, the distance is 74.4 km. (46.2 miles); the maximum grade is 1 in 37, with an average of 1 in 57 on the north side and 1 in 48 on the south, the altitude reached being 1,242 metres (3,400 ft.). The minimum curvature is 300 metres, 55 per cent. of the line being on curves. The main tunnel has a length of 14.6 km. (about nine miles).

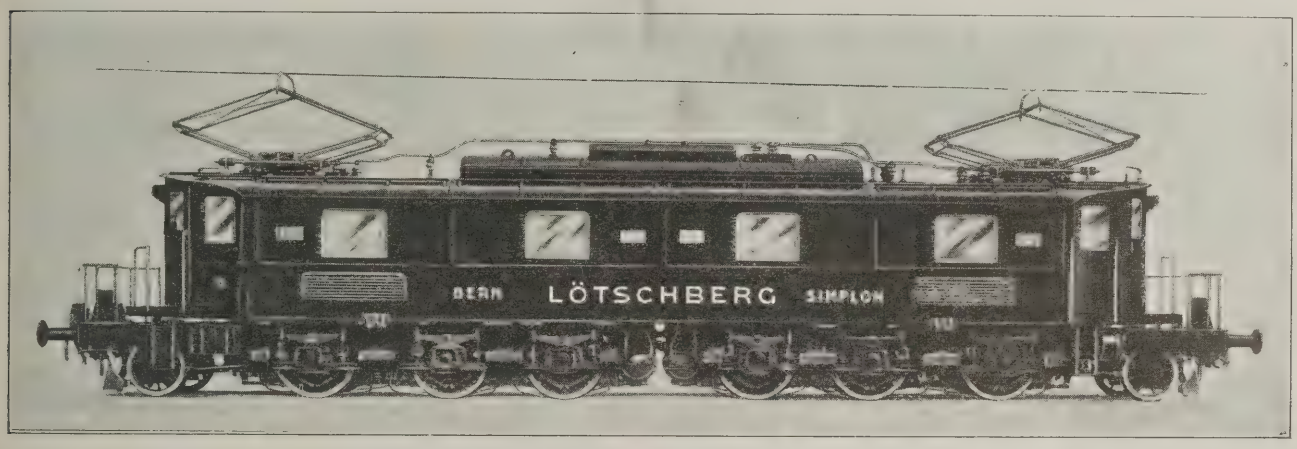

Fig. 1.—A 4,500-h.p. Sécheron Locomotive.

The Sécheron Locomotive.

Until recently the traffic was mainly handled by 2-10-2 locomotives crank-connected to two twin gear-driven dummy shafts, with two single-phase motors of a combined capacity of 2,500 h.p., rated on a 1½-hour basis; these locomotives were designed to haul 300 tons each, three round trips Spietz-Brigue and back in the 24 hours on the standard schedule without overheating. The traffic on the line has been gradually increasing, and instead of using two shorter trains, or one train with two locomotives, it was decided that a material saving in operating costs would come about through the use of a locomotive of a more powerful character; two locomotives were therefore ordered from the Sécheron Company (Société Anonyme des Ateliers de Sécheron) at Geneva, to haul a load of 560 tons up a grade of 1 in 37 at 50 km. (31 miles) per hour. Fig. 1 shows one of the locomotives. It is arranged with six driving axles, and leading and trailing axles, fig. 2.

The total weight is 141.6 metric tons, with an adhesion weight of 114.6 metric tons, or 19 tons per axle The total length over the buffers is 20.26 metres (66 ft. 5 in.), and the diameter of the driving wheels is 1.35 metres (about 52 inches). The gear reduction is 1 to 5.866. There are 12 motors in pairs, fig. 3, each 375 h.p., giving a combined capacity of 4,500 h.p. at 50 km. per hour at the driving axles on a 1-hour rating, or 3,700 h.p. continuously. The motors in each group are arranged permanently in series. The maximum speed is 75 km. (46.6 miles per hour), although the numerous twists and turns on the line will not allow of such a speed being used in practice.

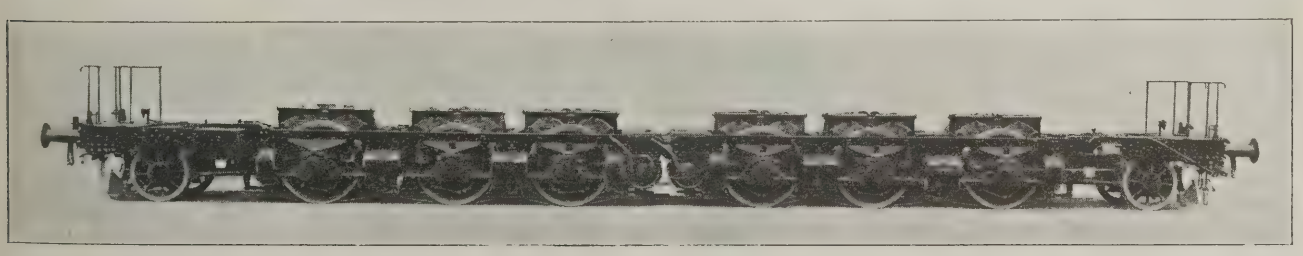

Fig. 2.—The Sécheron Driving Trucks.

Each pair of motors, therefore, has a combined capacity of 750 h.p. Each driving axle has two geared motors driving a quill shaft with a play of 13 mm.,

the movement up and down being allowed for by spiral springs. The Sécheron Company had previously built a number of locomotives for the Swiss Federal Railways with what might be termed tangentially-arranged spiral springs on the Westinghouse system; when it came to the arranging of a similar drive where six axles were concerned, a difficult problem arose in order to get the driving wheels into the space available. A new design was got out and patented by the Sécheron Co. which, instead of driving

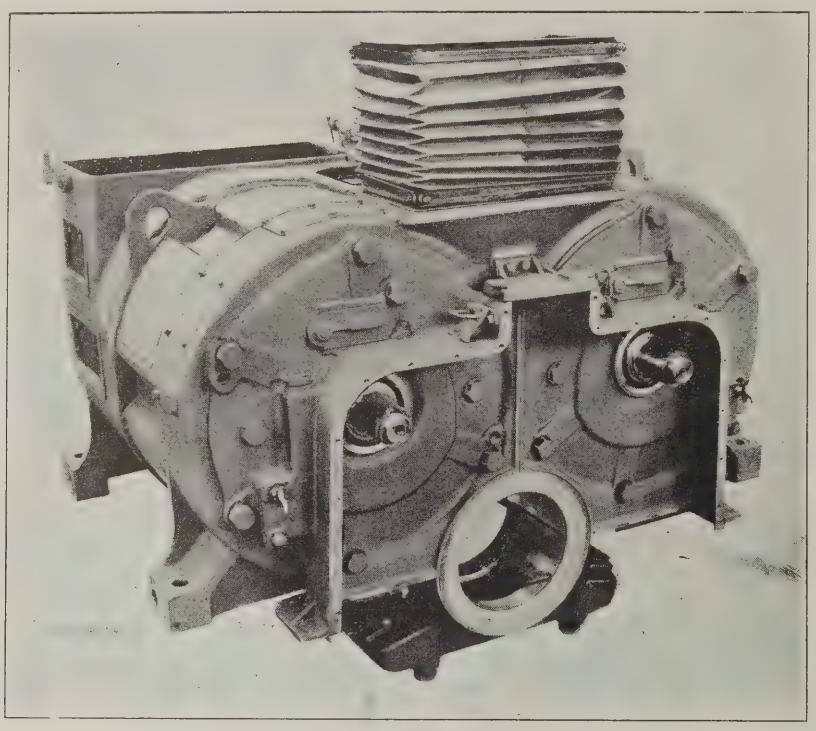

Fig. 3.—Twin-motor Driving Unit, 750 h.p.

on to the spokes with a sort of hand-shaped seat attached to the quill, drives across the spokes on to brackets attached to the inner rim of the wheel, the springs being arranged in pairs. Fig. 4 shows on the right the new type of spring drive as compared with the earlier construction, left. By this means it was possible to use driving wheels of 1,350 mm. (53.2 in.) diameter, thus reducing the unsprung weight by nearly 16 cwt. per axle. The design is such that the number of bolted parts is reduced to a minimum, and the clearance between the quill and axle can be increased. In order to reduce the strain on the springs owing to centrifugal force, they are mounted with an initial stress.

The motors have a series characteristic; they are of the single-phase type operating through a transformer off 15,000 volts at $16\frac{2}{3}$ cycles. Each set of three twin motors is mounted on a steel-plate truck, the trucks being connected by one straight link and one cross link; no haulage strain thus comes on the cab frame. The regulation of the motor is carried out by means of transformer tappings with the aid of pneumatic contactors. With the usual system of pneumatic operation, the air valves are operated by means of solenoids electrically connected to the controller; the Sécheron Co., however, designed a system with some novel features. A cam shaft is run along under the cylinder bases, the cams operating directly on the valve-stalk heads; a slow motion is given to the cam shaft by means of gearing, the shaft running from end to end of the locomotive, so that it can be operated mechanically from either driving position. The contactors are in two banks of 12 each in one long line, one for each group of three driving axles, the sets of cams being, so to speak, in tandem. By this means the wiring of the cab is very greatly simplified; it is claimed that nearly 3,000 metres of contactor circuit is obviated through the mechanical operation of the valves.

By means of an arm on the contactor jaw, the cam shaft is interlocked so that it cannot move further until the contactor has fulfilled its function. By means of an emergency push-button provided at each of the driving platforms, which destroys the equilibrium on both sides of an air-operated piston, the valve-operating cam shaft is shifted sideways so that all the valve tappet heads slip off the cams, thus opening all the contactors simultaneously. The controller is operated by turning a hand wheel which is geared to the cam shaft. Powerful air compressors are fitted to operate the air brakes and pneumatic contactors. In proportion to the power available at the draw-bar, the locomotive, as a single-phase machine, is remarkably light in weight, being only 31.5 kg. (69.3 lb.) per horse power, a figure materially lower than that of most d.c. heavy locomotives; in mountain work it is most important to reduce the dead weight to a minimum relatively to the haulage power. Rheostatic brakes are available.

Power Supply.

The current for the operation of the line is furnished by the Bernische Kraftwerke Company, which owns two power stations in the Kander Valley, at Spietz (64 m. fall) and Kandergrund (300 metres). Energy is purchased on the basis of a pre-war contract at about 3.5 c. per kWh (about .336d.) (although the power company cannot be called upon to supply more than a certain quantity at this figure), whereas in the case of post-war contracts in Switzerland, a price for traction duty of 7 to 8 c. is more usual. The Spietz station furnishes the current for the section Spietz-Fruitigen, 13.54 km. long, and the Kandergrund station for the remaining 60 km. to Brigue, which is divided into two sections; the two stations are operated in parallel. The generators are wound for 15,000-17,000

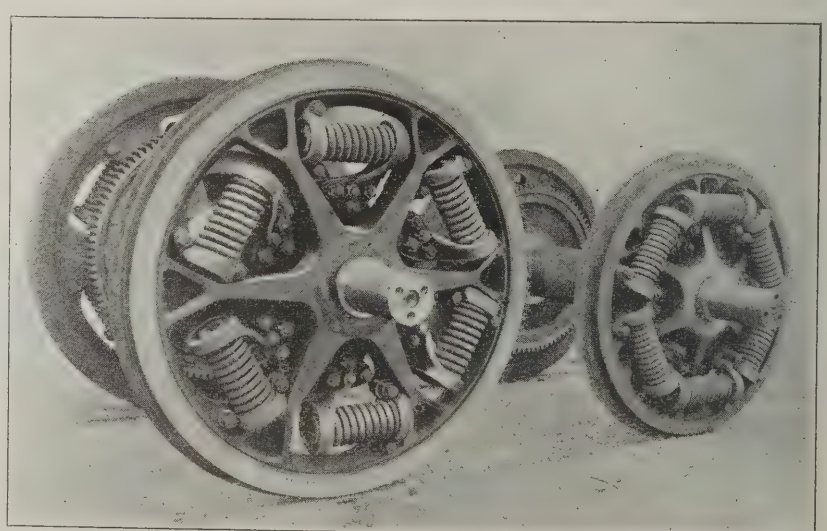

Fig. 4.—Old and New Quill Drives.

volts, $16\frac{2}{3}$ periods, single-phase; they feed the trolley line without any intermediary transformer.

A double feeder, consisting of two bare copper conductors 8 mm. in diameter, runs from end to end of the line. The trolley line is divided up into sections, but linked up at the stations to the feeders by means

of hand-operated oil switches; such operation of these switches as may be required is carried out by the station staff. The contact wires in the goods sidings are fed separately, so that at normal times they can be kept "dead." The maximum circuit breakers at the main feeding points open on to a current-limiting resistance, so that it can be seen whether a short has cleared itself. At each station feeding point a solenoid is placed in the line circuit operating a bell circuit. In the case of a "short," all the solenoids between the fault and the feeding points operate the bell circuits; by finding out which is the furthest bell that has rung, the damaged section can be located.

The trolley wire cross section is 100 sq. mm. along the line, as it acts as an auxiliary feeder; the construction is of the catenary type, with a steel carrier cable of 50 sq. mm. cross section. At these points the supports are of steel lattice work (fig. 5).

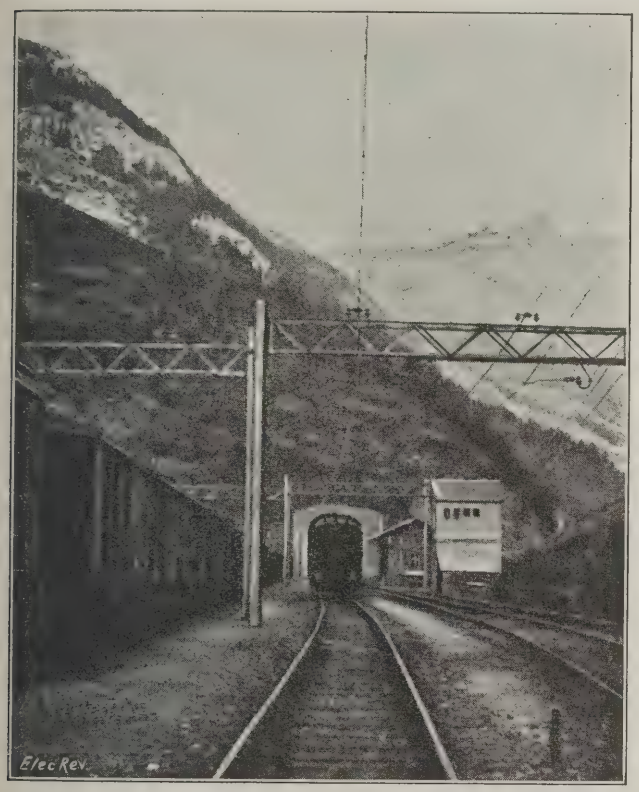

Fig. 5.—Overhead Construction at Goppenstein.

At the stations the trolley wire cross section is 55 sq. mm., the main trolley circuit being bridged round at these points. The trolley supports are of H-section steel with wide flanges, with steel brackets and double insulation; the normal span on the straight is 60 metres. In the main tunnel the supports are 22 metres apart, a copper-clad steel wire acting as the carrier. The trolley wire is placed 4.8 metres (15 ft. 8 in.)) above the rails in the tunnels, 6.7 metres (22 ft. 3 in.) at the stations, and 5.7 to 6.0 metres (18 ft. to 19 ft. 8 in.) on the open line.

A Run Over the Line.

Shortly after the termination of the Basle Conference in September, thanks to the intervention of Mr. Mayfarth, the managing director of the Sécheron Co., of Geneva, and the permission of the managing director of the Bernese Alps Railway, the writer was able to take a run over the line in one of the new locomotives. He went on board shortly before seven in the morning at the railway station of Spietz, which lies about 230 ft. above the lake of Thun; with a goods load behind the locomotive of 505 tons, after the slow start desirable with a long train, speed was rapidly picked up, and on leaving the station yard, up a rise of 1 in 66, it went up to about 40 km. per hour; shortly after leaving, a tunnel nearly a mile long was encountered; later the speed went up to 50 km. The main ammeter showed about 120 amps. with 17,000 volts, or 2,040 kVA. Up to Fruitigen the grades do not exceed 1 in 64. This section of the line was opened in 1902; Fruitigen is well known as the station for Adelboden. From Fruitigen to the northern mouth of the main tunnel there is a continuous grade of 1 in 37. On this section the speed repeatedly went up to 31 miles per hour, decreasing a little where the curves were very frequent. The pressure kept up very well at from 16,000 to 17,000 volts, the current at times being about 240 amps. at the lower of the above voltages, giving 3,840 kVA. The cab is arranged with six ammeters of a sector shape, one for each twin motor group; an ammeter and line voltmeter is arranged at each end, and an integrating wattmeter at one end. As with most locomotives on the Continent, a recording and indicating speed meter is fitted. For operating the contactors, a hand wheel is turned, a pointer showing how the control stands. The locomotives are capable of hauling 550 tons. The number of loaded trucks which can be hauled is limited by the pull allowed on the couplings and draw-gear of the trucks. It was useless, therefore, for the makers to arrange any multiple-unit gear, as, without a further locomotive at the back, one locomotive can take a train of the normal maximum weight.

There were two men on the locomotive; the mate had but little to do during the run; he controlled the two fans which blow air through the traction motors, according to the work to be done placing them in series or in parallel; for a material part of the time he looked out for the signals and called to the driver as he spotted them. The locomotive negotiated the 300-metre curves with great smoothness, without any of that lurching sometimes observable with steam and electric locomotives. The mechanical part of the locomotive was made by Ernesto Breda, of Milan, and the easy running reflected great credit on the makers.

Shortly after entering the tunnel, a white mist was encountered; this sometimes happens under certain atmospheric conditions, although there is no fog at either side in the open. The powerful headlights penetrated the mist very well. Later it was evident that a lot of water was coming through the tunnel walls, almost like rain. At one time after the opening of the line the 15,000-volt trolley line insulators gave a lot of trouble owing to the deposit of dust and salts from the percolating water. This has been got over to a considerable extent. To carry off the water the tunnel is arranged with a hump in the middle. At the southern mouth of the tunnel, fig. 5, the view towards the mountain top is very fine. After a comparatively short distance the line turns to the east, and the Upper Rhone Valley is seen over 1,300 feet below; the line lies on a shelf and slopes down to Brigue at about 1 in 45. During the run down the speed was kept at about 25 miles per hour; the electric brakes were used to a great extent, operating through resistances.

At Brigue a junction is made with the steam-operated section of the Swiss Federal line from Geneva and Lausanne, the lower part of which is operated on the single-phase system, also with $16\frac{2}{3}$ periods. From the station of Brigue onwards through the Simplon tunnel the traffic is worked by means of three-phase locomotives. The single-phase tracks are kept clear of those fitted with 3-phase overhead work, the goods and passenger trains being shunted from one line on to the other with the aid of a steam locomotive. During the recent difficulties in the Rhone Valley when, as a result of an avalanche, the Upper Rhone Valley railway was blocked, the traffic was taken over the Loetschberg *via* Berne.

Certainly there are few better ways of seeing a railway across Swiss mountains than from the cab of an electric locomotive, especially when the "Clerk of the Weather" shows what he can do.

The thanks of the writer are due to the Bernese Alps Railway Co. and to the Sécheron Co., of Geneva, for the above particulars. In the preparation of the notes use has been made of an article by M. L. Thormann, chief constructional electrical engineer.

Sag Calculations for Power Transmission Lines.

A consideration of the requirements for Overhead Conductors under varying working conditions due to changes in temperature, wind pressure, ice covering, &c.

By WILLIAM T. TAYLOR, M.Inst.C.E., M.I.E.E.

IT is now generally recognised that the modern construction of power transmission lines requires a more careful determination of the sags and tensions of the conductors. For such work, which nowadays involves much more steel construction and much longer spans than was the practice in the past, it is necessary to so choose the sags as to maintain a safe and economic balance between conditions such as:—

(*a*) The strength of line supports required to resist the conductor-tension, at terminal points and tangents in the line, with moderate or small sags; and

(*b*) The dimensions of line supports required for minimum ground clearance, and for proper separation of the conductors from each other, for large sags.

Without question, the material best suited in the majority of cases to meet these and other requirements for maximum economy is the hard-drawn copper conductor; for most of the bigger lines, cable would be used. In tower line construction the tendency has been to employ longer and longer spans, which practice has resulted in excessive cost of supports and, in many cases, an increased instead of a decreased insulator hazard. Due to this practice, the tendency is to reduce the maximum allowable tension. This condition naturally applies more rigorously to the higher-strength line conductors such as steel, aluminium-steel and copper-steel, than to the *all* aluminium and copper conductors. That is to say, for hard-drawn copper, 50 per cent. of the ultimate tensile strength would more generally be the rule, but, for aluminium-steel, only 40 per cent. or even 30 per cent. of the maximum stress may be used. Thus, from the strength point of view, the use of copper for the main line—excluding certain special spans, which will always employ copper steel (copperweld) where copper is used for the main line conductor—may be ample to meet all requirements.

For hard-drawn solid copper conductors, the above remarks for maximum allowable tension do not apply because the normal maximum tension of the largest size of conductor is no greater than 4,300 lb. It is very important that the *proper* sag of lines be given in each case. Too large a sag is objectionable for the reason that it may require higher line supports to give the necessary ground clearance required by law, or the span length may be reduced, which would in turn require a greater number of line supports, insulators, &c.; also, a larger sag would mean greater spacing of the conductors to prevent them from swinging together. Hence, there may be a disadvantage in the use of, for instance, too high a value for the modulus of elasticity E, where the smaller sizes of stranded conductors are used on fairly long spans. With a small conductor or a conductor of light weight used on a long span, it is often found that the sag just about necessary to keep within the elastic limit when subjected to its maximum loading in winter will produce a very slack line in summer, and, if very wide separation of the conductors is not allowed, they are likely to be blown together. This condition is made still worse where use is made of too high a value of E in the calculation for sag. In the United States, Canada, and other countries it is customary to use a higher value of E for solid than for stranded conductor; the commonly accepted value of E for solid copper (hard drawn) is 16,000,000 lb. per sq. in. As a small conductor is stronger than a large conductor of equivalent sectional area, the tension allowed in stringing should be greater than for the equivalent stranded conductor of large size; with this in mind, there may be reason for rating both solid and stranded conductors for one value of E. In this way the values are better "evened up" than is the case where the mechanical constants are changed by stretching stranded conductor so that W, A, *d*, &c., are different from the recognised values used in the original calculations for sag.

In the calculations for sag, many variables come into play. In the first place, calculations are made on the assumption that the supports are at the same level. We also start out assuming that the supports are absolutely rigid and that the conductors are fixed solidly to their supports, *i.e.*, that supports do not have any flexibility at the top, and that the conductors do not slip through their bindings at the insulators, or that the suspension insulators are not free to swing in the direction of the line, &c. Also, in the design of a line we start out knowing that there is, or that sooner or later there will be: (*a*) variation in weight and area of material from the value assumed in the original calculations; (*b*) uncertain value of tensile strength and/or elastic limit of the material from that assumed; (*c*) uncertain value of coefficient of expansion as well as modulus of elasticity; (*d*) variation of weight along the line due to non-uniformity of ice and/or to density of the ice varying through wide limits from the value originally assumed, &c. As an instance of a small change in the sectional area A, take the two standard sizes 0.025 sq. in. and 0.02545 sq. in. (the difference in area is 0.00045 sq. in.); in a 1,000 ft. span the difference of 0.00045 sq. in. in A will produce a difference of 36 inches in sag for the same temperature and same loading conditions.

For a given material the size of conductor has more of a determining effect upon the possible length of span than any other condition. For line supports at the same and at different levels, there is a proper ratio between the permissible span length, the size of conductor, and the different weather conditions; the most economical span is dependent upon many different and variable conditions—local, mechanical and electrical. Certain of the *actual* local conditions may never conform with the requirements of the Regulations for Overhead Lines. These Regulations intend to provide for safety as regards tension and sag, requiring that:—

(*a*) Maximum tension be taken at a temperature of 22 deg. F. Actually, the maximum tension occurs *at the lowest temperature* with the actual maximum loading; and

(*b*) Maximum sag be taken at a temperature of 22 deg. F. for maximum loading (see footnote Table II), or at maximum summer temperature. Actually, the maximum sag occurs *at the highest temperature at which sleet will form*, in conjunction with ice and wind loads, not the specified values.

Under maximum specified loading conditions the con-

ductor may be stressed to the maximum allowable tension of the material. The conductor is therefore longer under such conditions and the sag greater than an unstressed (or unstretched) conductor. If the temperature increases, the stress will decrease because the expansion of the conductor will cause an increase in sag. At a certain sag, the two tendencies will balance each other. On the other hand, if the maximum load is removed—as would be the case in summer—the decreased stress on the conductor will allow it to contract, thus decreasing the sag, which condition increases the stress, but in this case the sag is made greater due to the increased length or stretch of the conductor. These two tendencies also tend to balance each other. Thus, variations of temperature for any loading produce variations in the length of conductor, and variations of length produce variation in sag. As a conductor tightens up with a decrease in temperature, the resulting increase in stress stretches it, and the stretching keeps the stress below what it would be if there were no stretching. On examination of the tables, these various changes are seen to be evident. For instance, in winter the conductor is stressed to its maximum tension, and the sag under maximum loading conditions is seen to be as great or greater than under any other weather condition, *i.e.*, the conductor is stretched so that it is longer; also, when the maximum load is removed, the decreased stress in the conductor will allow it to contract, thus decreasing the sag, which condition tends to increase the stress; and, when the temperature is increased, the stress in the conductor is further decreased because the expansion in the conductor causes it to sag more; also, with a decreasing temperature, the conductor tightens up and the resulting stress stretches it—this stretch is the best indicator of the ability of the material to resist severe loads; on the other hand, a brittle conductor is a dangerous conductor, and demands a higher factor of safety.

The Regulations specify 24 tons per sq. in. or 53,760 lb. per sq. in. section for solid hard-drawn copper; for cable, a reduction factor should be taken into account. They also specify a factor of safety of 2.0, or an allowable tension of 26,880 lb. The elastic limit of hard-drawn copper is somewhat greater than one-half the ultimate tensile strength, and can be safely taken at 55 per cent. of the ultimate tensile strength. However, the values used in the accompanying tables for the different sizes are those recommended by the Electricity Commissioners* (see Table I). The modulus of elasticity E is specified as 18,000,000 for hard-drawn copper (solid *and* stranded); this value is high for stranded conductor; it is used in the tables for solid conductor. The value of the coefficient of linear expansion α is taken at 0.0000093 per deg. F. Maximum loading P refers to a load (specified by the Electricity Commissioners) of one-half inch radial ice coating and 8.0 lb. wind pressure (right angles to the line) at a temperature of +22 deg. F. (The *constant* for this wind pressure $p=0.0032v^2$; where $v=\sqrt{312.5p}$. In the United States and Canada the generally accepted value for $p=0.0025v^2$; where $v=\sqrt{400p}$).

As it is the practice to consider only *standard* sizes of conductors, and as one kind of material and one size of conductor for each transmission line (circuit) is the general practice, it is sometimes better to make a chart or diagram in terms of one size of conductor, for the use of men in the field. With time, the sizes given in the tables may change, but while the characteristics of the material remain the same, and the loading conditions remain unchanged, it is but a simple matter to plot a chart or graph, so that any size of conductor can be chosen to suit any standard, and any sag value can be determined from the tables for any span length and any change in temperature. The tables† should prove useful both as a means of quickly comparing results with changed loads and also for drawing diagrams or charts to cover any intermediate value of span, temperature and size of conductor, &c. In order that the erection gang obtain accurate values of sag and temperature (or tension, which is obtained by use of the general formula: $P=l^2w/8D$) for any intermediate span length, all that is necessary is for the engineer to mark off the values of sizes in use or to be used on the line, and plot the values on cross-section paper or on

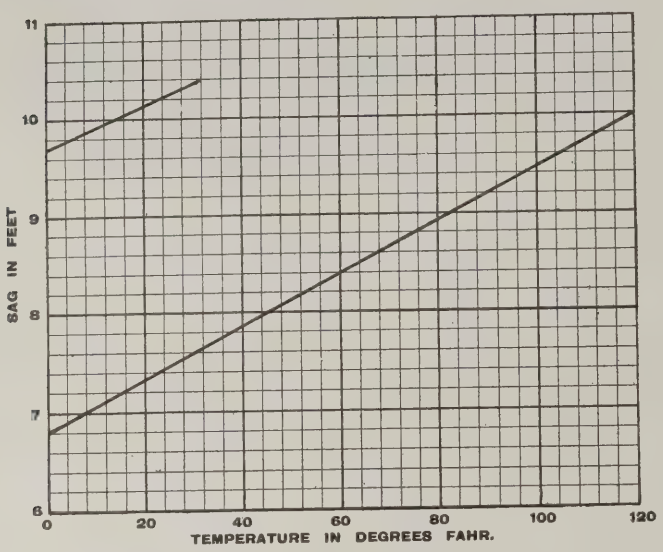
NOTE:—*Resultant Loading* = $\sqrt{(\text{dead } load + 0{\cdot}5 \text{ inch ice } load)^2 + (8{\cdot}0 \text{ lb. wind } load)^2}$; where: dead load = w, 0·5 inch ice = d_1, and 8·0 lb. wind pressure = p.

This wind pressure is assumed to correspond with a wind velocity of 50 miles per hour, therefore $p=0{\cdot}0032v^2$ where $v=\sqrt{312{\cdot}5p}$. A very much used value for p is $0{\cdot}0025v^2$, making $v=\sqrt{400p}$. For solid wires the value $0{\cdot}003v^2$ appears to be a good mean; making $v=\sqrt{333p}$.

Quantity of ice per foot of length = $0{\cdot}0218d_1(d+d_1)$, in cubic ft.

Total vertical weight per foot of length = $w+57\times0{\cdot}0218d_1(d+d_1)$, in lb.



Load due to wind pressure per foot of length on the conductor = $0{\cdot}666(d+2d_1)$, in lb.

* As the resultant load increases, the vertical sag (D_v) decreases because of the greater angle of swing from the vertical plane.

* See also British Engineering Standards Specification, C.A. (E.L.) 6349.

† These tables replace Charts V and VIII for S.W.G. sizes given in the ELECTRICAL REVIEW, October 3rd, 1924.

logarithmic paper. This refers to old, present, or new standard sizes of conductors. For lines using but a few

Sag Chart.—For span=400 ft.; 0.10 sq. in. hard-drawn solid copper; P=2,655.

The upper curve is for conductor loaded with half an inch ice and 8 lb. wind for temperature from 0 deg. F. up to freezing point of +32 deg. F. The lower curve is the "stringing" curve, and shows sags for any temperature between 0 deg. F. and +120 deg. F.

This class of stringing chart is recommended for the erection gang; if desired, other curves may be drawn in for other spans and for corresponding tensions.

In this example, "maximum" sag occurs at +22 deg. F. with load, or at a higher temperature (with load) at which sleet will form (see continuation of upper curve).

Fig. 1.—Transmission Line Stringing Chart.

different spans, it is recommended that a curve be drawn for each span in the manner shown in fig. 1.

The maximum stress conditions in a span are always assumed at the outset, and the first step in designing a transmission span is to look up the allowable value of tension P; this is given in column 3 of Table I. The maximum sag, which may occur either at the maximum temperature *with* or *without* load other than the bare conductor in still air (see fig. 1) is not known, and therefore must be determined. As conductors are never strung under actual maximum loading conditions, it is customary to string them so that, under maximum loading conditions, the stress in them will not exceed the loading specified by the Electricity Commissioners. In this country it is still common practice to use the dynamometer when stringing conductors. A better method is to find the sag for the particular temperature at the time of stringing (bearing in mind that on a sunny day the conductor is at a higher temperature than the air, hence a few degrees must be added to the reading given by the thermometer) and measure the amount of sag required for each span on the adjacent line supports by placing a dab of white paint at the measured levels, or by fixing an adjustable white batten on each adjacent line support at the measured sag level. A line of sight is then taken between these two points, and the conductor is allowed to sag until it coincides with this line of sight. A dynamometer is subjected to very rough handling in the field, and is very seldom tested for accuracy. The *sighting method* should preferably be the one chosen, as it is not only reliable and simple, but it should provide a permanent record on the line supports for present and future reference, and for re-sagging purposes, &c.

(*To be concluded.*)

Standard Performances for Electrical Machinery.

A critical review and some observations on Specifications Nos. 169 and 226, dealing with the working requirements of motors and generators, of the British Engineering Standards Association.

By F. T. CHAPMAN, D.Sc.

(*Concluded from page* 251.)

WE may now examine in detail the two specifications, Nos. 169 and 226, to which we have already referred. They are concerned with large generators and motors rated at more than 2.5 kVA or 2.5 b.h.p. per revolution per minute, excluding, however, alternators of the steam turbine-driven type, which come within the scope of a special specification, No. 225.

No. 169 is a specification for a rating permitting overloads, while No. 226 describes a continuous maximum rating. Both are drawn up in the same form; the main portion of the material is divided into thirteen sections, with the same titles in both cases, and the remainder is arranged in eight appendices. With a small exception in the case of the second, the appendices are identical in both specifications.

The first section describes the scope of the specification. The second and third define certain terms, such as "Rating," "Overload," and "Inherent Regulation," and describe the three types of enclosure which are recognised, *viz.*, "Open," "Duct Ventilated," and "Enclosed Self-Cooled." This is naturally a smaller number of types of enclosure than was recognised in No. 168 in the case of smaller machines. The fourth section defines certain types of machine, such as "Change-Speed Motor," "Variable-Speed Motor," and "Inverse-Speed Motor."

The most important matter in Section V is the specification of the permissible deviation from the sine shape in the e.m.f. wave of an alternator. Since there is no commercial analyser of proved reliability on the market at the present time, the Association has had to rely upon a graphical method of comparing the actual wave form with a sine wave having the same root mean square value. The specified test which the wave form must pass is that, when the two curves are superimposed so as to show the least difference, the maximum deviation between them shall not exceed 5 per cent. of the maximum ordinate in the case of alternators with outputs exceeding 2,500 kVA, nor 10 per

cent. in the case of alternators with outputs below this limit. Where a pronounced ripple of 400 per sec., or over, is present, the deviation of this ripple from a mean curve drawn through it shall not exceed 2½ per cent. of the maximum ordinate. In view of the number and nature of the processes involved in this test, its accuracy cannot be great. The clause is a very necessary one, however, and it is to be hoped that the advent of a satisfactory analyser may make it possible ere long to replace the present cumbrous test by something at once simpler and more accurate.

The next section (VI) relates to rating. The rating of a machine has already been defined in Section II as "the output assigned to it by the maker, together with the associated conditions marked on the rating plate." This is a clear and unambiguous statement, but in Section VI we are told that "the rated load defines a load which can be carried on test under the conditions of the rating and of this specification for an unlimited period without exceeding the limits of temperature rise given in Section VII." Presumably this means that "the rated load *is a* load which can be carried, &c.," and as there will be an infinite number of such loads for any given machine, the "definition" is not of much value. Perhaps the meaning of this statement would be conveyed better by some such sentence as this: "A machine rated in accordance with this specification will give a performance which will not fall short of the standards laid down here when tested in the manner prescribed herein and under the conditions of load, &c., stated on the rating plate."

The remaining sections deal with the tests to be made and the standards of performance which are to be attained, but there is a certain lack of clarity about the way in which they are set out. It would have been better if they had been preceded by a schedule summarising the prescribed tests, which are:—

(*a*) Load test, for the purpose of examining the temperature rise and the commutation.

(*b*) Overload, excess current and excess torque tests.

(*c*) Insulation resistance and high voltage tests.

In connection with (*a*), Section VII sets out fully the methods of measuring temperatures which are demanded and the maximum measurable temperature rise which the specification permits. Embedded temperature detectors are called for in all machines having an axial core-length of one metre or more.

Section VIII deals with momentary overloads under the title "Excess Current and Torque." Here the two specifications differ. According to No. 169, a generator is required to withstand a 50 per cent. increase of current beyond its rating for one minute, and d.c. and a.c. synchronous motors are required to withstand a 50 per cent. increase of torque without injury and without falling out of step, the voltage and frequency remaining constant. Induction motors must be able to withstand, in addition to the last test, an excess torque of 100 per cent. above normal for 15 sec., except where the number of poles is abnormally high. According to No. 226, the 50 per cent. excess current and torque must be applied for 15 sec. only, and induction motors are required to withstand 75 per cent. increase in torque instead of 100 per cent. The clauses relating to prolonged overloads in No. 169 occur in Appendix II, but as they are an essential part of the specification, it would appear that they should come in Section VIII with the other overload conditions.

The standard performance with regard to commutation (Section IX) is necessarily rather vague. The machine is to work "practically sparklessly" with fixed brush position and without injury to the surface of the commutator up to the momentary overload.

No standard of performance is given in the section relating to efficiency and power factor (Section X), but it is hinted that the purchaser should ask for guarantees, and a promise is held out that a standard method of verifying efficiencies may be published in the future.

A minimum insulation resistance of rated volts/(1,000 + rated output in kVA) is to be insisted on before the high-voltage test is applied. The methods of making the test and of measuring the voltage are well and fully described. The test voltage is to be raised and reduced slowly and maintained at its maximum value for one minute. The table of voltages which must be withstood by different parts of machines of different types calls for no comment.

The penultimate section deals with certain details relating to the carrying out of the tests, and the final section sets out the information which must be given on the rating plates of different types of machines. If any addition to the latter is permissible, the manufacturer might be required to state whether the insulation is class A or class B.

The first appendix gives a classification of insulating materials. The second refers to the conditions in respect of cooling air temperature and altitude within which the specification applies, and in the case of No. 169 it sets out the conditions relating to sustained overloads. It is not obvious why these clauses have been put into an appendix, for they would appear to be an essential part of the specifications.

The third appendix contains instructions for making the temperature measurements. This material also is essential to the purposes of the specification, and its proper place would appear to be alongside the other paragraphs relating to temperature. The same observation applies to the precautions to be observed in taking resistance measurements of windings for temperature determination, which form the subject of Appendix IV.

The suggestions to purchasers in respect of information to be sent to manufacturers with orders and inquiries come properly in Appendix V; Appendix VI, when ready, will deal with methods of declaring and verifying efficiencies, and Appendix VII applies to terminal markings. The final appendix relates to high-voltage tests, and contains eleven pages of matter bearing on the measurement of high voltages by means of spark gaps.

Specification No. 225, which was issued at the same time as those we have just discussed, relates to alternators of the type usually driven by steam turbines, and to exciters forming part of such sets. The general arrangement of the specification is similar to that of Nos. 169 and 226, but the sections relating to types of machine and types of enclosure are omitted.

Two ratings are recognised by this specification; one is the defined test rating and the other, which is called the "service rating," is the load "corresponding to the most economical output of the combined set." If required by the purchaser, this shall be stated by the maker and marked on the rating plate. A short-circuit test is not included in the standard test performance.

The specification concludes with the same eight appendices as occur in Nos. 169 and 226.

Although they are susceptible of improvement in form, these three specifications are very useful documents, and they increase the debt which the electrical community owes already to the British Engineering Standards Association.

Electric Cooking and Domestic Economy Teaching.

The London County Council instructed its Education Committee in 1923 to report whether or not at appropriate centres cooking by electricity should be taught. A report has now been prepared. The Elementary Education Sub-Committee states that at four cookery centres experimental electrical installations have been provided. The Sub-Committee proposes to continue the use of the electric cookers which have been installed. Electric cookers as well as gas will be installed in new centres serving districts in which the majority of children come from homes using electricity. In other cases no action will be taken, except where the supply authorities are prepared to furnish and install electrical equipment on exceptionally favourable terms.

Unemployment Insurance.

By JOS. J. H. STANSFIELD.

THE Report of the Blanesburgh Committee on unemployment insurances has just been issued. The Committee was appointed "to consider in the light of experience gained in the working of the unemployment insurance scheme what changes in the scheme, if any, ought to be made."

The report points out that unemployment as we know it is, comparatively speaking, a new phenomenon. Towards the end of the nineteenth century it became more manifest; in the first decade of this century it assumed more serious proportions; and in 1911 it was first made the subject of statutory enactment.

The Committee unanimously submits that the risk of genuine unemployment should be insured against, and that a compulsory scheme should be a permanent feature of social legislation.

It is estimated by the Government Actuary that unavoidable unemployment averages six per cent. over the period of a trade cycle, and whilst it will be generally admitted that there should be a careful examination as to the genuineness of the search for work, the worker who is unemployed through no fault of his own should be protected from the demoralisation that too often follows a period of unemployment.

The recommendation of a non-contributory scheme was not within the reference, but it was agreed that a contributory scheme should comply with certain conditions.

The worker's contribution must be moderate in amount and secure an insurance sufficient in the great majority of cases to save him during inevitable unemployment from recourse to public assistance; the insured contributor should not be tempted to improvidence when in receipt of good pay; the benefits should be less than the general labourer's rate of wages, so that there may be no temptation to prefer benefit to work; the mobility of labour must not be unduly interfered with, and those who would be benefited by a life overseas must not be deterred from emigration. Subject to these conditions, the scheme should be as attractive in its benefits to the insured contributor as, on a strictly actuarial basis, it is possible to make it.

Much has been said and thought about the abuse of the "dole," and it is satisfactory to note that the Committee shows that this has not occurred to anything like the extent which has been commonly supposed, but the suggestions as to contributions and benefits are designed to make abuse more difficult and less attractive.

Space will not permit of the publication at present of the full details of the rates proposed, but it may be generally stated that the rates of benefit and contribution would be smaller than those now in force, and that the contributions of employer, employé and the State would be equal in amount.

At present an employé is entitled to full benefits at 18, when the earning capacity is such as to give unemployment benefit a special attraction, and it is therefore proposed that a new classification should be adopted under which the benefits and contribution of employés aged from 18 to 21 should be below that of the adult.

The new scheme will start with a considerable load of debt. The coal stoppage increased the deficit from 7 to 21 million pounds, and in order to restore solvency a special contribution is suggested of a penny per week from men and young men, and a halfpenny per week from women and other contributors, until the deficit is wiped out. This proposal is calculated to meet with opposition, but it may be a reminder that the heavy disbursements during last year were not taken from an existing or unlimited hoard, but were rather borrowed in advance.

The question of unemployment insurance raises problems which more or less affect the morale of the community as a whole as well as the well-being, peace of mind, and self-respect of many millions of workers.

The Committee states, for reasons given, that public opinion outside the insured classes was and still is to some degree unfavourable to this class of insurance, but whether this view be well-founded or not it is satisfied that any scheme of unemployment benefit in this country will be durable and secure of general acceptance only so far as it is believed to be immune from the social dangers which, in greater or less degree, may lurk in such schemes.

An investigation made in 1913 showed that there was nothing to indicate that unemployment was being provided for by resort to the Poor Law or from any other outside sources, facts which are a notable tribute to the prudence, self-reliance, and self-respect of the insured workers as a whole, whilst under the Act of 1919 benefits were raised without altering the rates of contribution, and at the end of 1920 over £21,200,000 had been accumulated.

It cannot but be hoped by those who are anxious for the common good, that the future course of events will restore the financial solvency of a fund which is designed to provide benefits for all insured persons who can fairly be described as genuinely employed, and that some means may be found to avoid a recurrence of the disastrous circumstances of the past year.

The inquiry was primarily into unemployment insurance, but the Committee was impressed by the consideration that "preoccupation with the task of ascertaining how best unemployment can be insured against" must not weaken the efforts to get rid of unemployment itself, and a number of valuable suggestions are made to this end.

Amongst these may be mentioned a systematic inquiry by every industry into its own unemployment problem and its own supply of labour; a greater mobility of labour; and the helpful guidance of juveniles for their future careers.

The Report is one of 100 pages, and can be obtained from H.M. Stationery Office at the price of one shilling. It is well worth careful perusal, for it contains much that is interesting, informative, and suggestive.

Unemployment during January.

The *Ministry of Labour Gazette* reports that although unemployment in the engineering industry during January remained bad on the whole, there was certainly improvement. There was, however, a setback in the electrical engineering branch, the proportion of unemployed rising from 6.1 to 6.8 per cent. There was an improvement in the electrical wiring and contracting industry, in which the unemployment percentage fell from 8.2 to 8.0. On the other hand, the proportion of unemployed in the electrical cable, wire and lamp manufacturing group rose from 7.1 to 8.3 per cent. The actual numbers of unemployed were as follows:—Electrical engineering, 5,238; wiring and contracting, 1,113; and cable, wire and lamp manufacturing, 7,325.

Indian Electrical Notes.

(From Our Indian Correspondent.)

IT will be remembered that the opening of the electrified Harbour Branch at Bombay was the first step in introducing railway electrification into India. This service, which has since been extended to Bandra, forms only part of the various schemes at present in hand for the electrification of the suburban and main line services in Bombay, which on the Great Indian Peninsula Railway include the electrification of the main and suburban line to Kalyan, of the main lines to Igatpuri and Poona, and on the Bombay, Baroda, and Central India Railway, the electrification of the lines between Church Gate and Borivli. The work on the uncompleted portion of the schemes is being steadily pushed forward, and it is hoped soon to inaugurate an electrified service on the whole of these sections. With the opening of these services Bombay will feel a great benefit, and a better distribution of its great population may be looked for in the near future. The re-examination of the problem of suburban traffic in Calcutta is now approaching completion, and the preparation of a revised electrification scheme is in hand as a result of the decision to proceed with the construction of the Calcutta Chord Railway with a bridge across the Hooghly at Bally. The Madras suburban traffic problem is also being dealt with. Additional tracks are being provided on the suburban section of the South Indian Railway from Madras to Tambaram, and the electrification of this section is under investigation. The feasibility of electrifying other portions of the South Indian Railway is also being discussed, since there is a possibility of a hydro-electric supply being available. In view of the great benefits to be expected in railway working in South India from a hydro-electric supply, the Government of India has associated itself with the local government in the investigation of hydro-electric resources in the Madras Presidency, and the schemes are at present being examined by Messrs. Merz & McLellan, consulting engineers for electrification schemes to the Government of India.

The Chief Inspector of Mines' report for 1925, states that the number of collieries using electric power increased from 99 to 108, the aggregate horse power employed at collieries increasing from 43,502 to 52,336. During the year electrical plant was installed and brought into commission in thirteen additional coal mines. In two gassy coal mines, one in the Raniguńj and one in the Jharia coal field, there was a considerable increase in the horse-power of electric motors installed below ground. The electrification of several important collieries is now in progress.

It is hoped that the preliminary work in connection with the Calcutta station of the Indian Broadcasting Company will be put in hand within a few weeks, so far as the transmitter building is concerned, and that it will be sufficiently advanced by early April to accommodate the first shipment of transmitting machinery. The aerial masts will be 150 ft. high, and the station will be of an ornamental and approved type. About five *cottahs* of land will be covered, while a further area will be utilised for the earthing system. Studios will be located in a carefully chosen vicinity so that interference from outside noises and any possibility of inconveniencing neighbouring residents may be reduced to a minimum. The company's manager is now engaged in examining sites that may prove suitable, and it is possible that Kyd Street or Park Street areas may offer the accommodation desired. The first programme will probably be broadcast in six months' time, but there are many difficulties still to overcome. Engineers from England are already on their way to India. As in other countries, programmes will be under the supervision of special programme boards, on which there will be Indian representatives competent to gauge the tastes of the great Indian population. Upon these boards will devolve the task of arranging programmes of wide appeal, and necessary adjustments as to the balance of the various items, such as lectures, "talks," music, &c., will be recommended by them. So far as Calcutta is concerned, interference from the spark station at Fort William is not anticipated as a serious difficulty. Technically there is little to fear in this respect, because the new station will transmit on a wave-length of 350-400 metres, while the Fort William station utilises a considerably greater wave-length.

X-Ray Martyrs.

According to the *Daily Chronicle* Special Correspondent, X-rays have claimed further victims in France. Sister Glossinde, who for 15 years assisted Dr. Reiss, of Metz, himself a victim of X-rays in 1922, has now died. The first symptoms were revealed after the war, and last year the sister had her right arm amputated.

Dr. Harcourt, chief of the X-ray department of a Marseilles hospital, had the forefinger of his right hand amputated on the 15th inst. He is 60 years of age, and has already undergone six operations. For his X-ray services during the war he was awarded the Legion of Honour.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

Trans-Atlantic Telephony.

On February 15th, Sir W. Mitchell-Thomson, the Postmaster-General, informed Mr. Day that the number of telephone calls made on the Trans-Atlantic service since its inauguration was 338, of which 40 per cent. originated in England.

Broadcasting.

On February 15th, Mr. Duckworth asked the Postmaster-General if he would state the attitude of his department towards the new regional broadcasting scheme; and whether there was any hostility to the development of alternative programmes on the part of either Government departments or commercial wireless services.

Sir W. Mitchell-Thomson said that he gave authority to the British Broadcasting Company last year to undertake experiments with the view of ascertaining whether a regional scheme could be adopted without causing interference between one broadcasting station and another, or between broadcasting stations and other wireless stations. The company conducted some experiments and the Corporation was at present arranging to carry out further experiments. The answer to the latter part of the question was in the negative.

Sir W. Mitchell-Thomson informed Mr. Grotrian and Major Ainsworth that his attention had recently been called to a case in which an experimental wireless station had been used for the transmission of concerts. The licensees claimed that those concerts were necessary for the purpose of scientific experiments which they were conducting; but he was not satisfied on that point, and he had asked them to discontinue the concerts until the matter had been considered in the light of certain information which he had requested them to furnish.

Sir W. Mitchell-Thomson informed Mr. G. Peto that he could not consider the reduction of the licence fee for crystal wireless sets to 5s. per annum.

Later, the Postmaster-General stated that the number of persons prosecuted for the use of unlicensed wireless apparatus from the autumn of 1925 to January 31st, 1927, was 583, and the number of convictions 579. The penalties ranged from a fine of 2s. 6d. to £10, in addition to £10 costs.

Beam Wireless Tests.

On February 15th, Mr. Day asked the Postmaster-General if he would state the latest results of the official wireless beam test between Australia and Great Britain.

Sir W. Mitchell-Thomson said that the contractors stated that certain defects developed in the auxiliary apparatus during the recent test, and they were at present engaged in correcting those defects. When that had been done a further test would be arranged.

Agriculture and Electricity.

On February 16th, Sir H. Hope asked whether it was contemplated to nominate any representative of the agricultural industry as adviser to the Electricity Board, so that the benefits of the Electricity Supply Act of 1926 might be secured for that industry?

Colonel W. Ashley said that the manner in which the Electricity Board could best keep itself informed of the special requirements of agriculture in connection with the supply of electricity, was a matter which it would be for the Board itself to determine as occasion arose.

Electrical Surveys.

During the discussion of Supplementary Estimates in Committee of the House on February 17th, on a token vote of £10 for the expenses of the Ministry of Transport, Col. Ashley explained that the vote was necessary to enable him to use certain appropriations in aid to meet an excess of expenditure incurred in connection with the Electricity Act of last year. Before bringing in that measure, the Government considered that it would be well to have independent outside technical advice, in addition to the advice given by the Electricity Commissioners. In the spring of 1925, a Supplementary Estimate for £15,000 was voted by the House, which enabled the Government to use money in the financial year 1925-26 to get that outside technical advice on the Weir Report and on the scheme generally. Not more than £10,500 was actually expended, and so, early last year, a sum of £5,000 was inserted in the Estimates as a re-vote, in order that the work might be carried on. That £5,000 was not sufficient to meet the expenses incurred in the general scheme and in the technical scheme of investigation up to December 15th last, when the Electricity Bill became an Act. On December 15th, any money for those investigations, according to the terms of the Act, became a charge on the fund under the control of the Electricity Commissioners, afterwards to be recovered from the Central Electricity Board. Up to December 15th, the money found by Parliament would be recovered, with 5 per cent. interest, from the Central Electricity Board when it functioned.

Mr. W. Baker (Labour), who moved to reduce the vote by £5, asked for further details.

Mr. G. Balfour (U.) objected to the procedure which the Minister had taken, and contended that the matter should

come before the House at a later stage, so that the House and the country could understand what had been done.

Mr. Harris (L.) asked for the names of the consulting engineers who had advised the Government, and the amount of their fees.

Mr. D. Herbert (U.) said it was wrong for a Government department to incur considerable expenditure on the assumption that a Bill before the House would become an Act of Parliament without alteration. Col. Ashley said that not one penny had been spent without Parliamentary sanction.

Col. Woodcock (U.) complained that money was being wasted on investigations into the Severn barrage scheme.

After further debate, Col. Ashley said that the surveys, general and special, cost in the financial year 1925-26, £10,500. In the current financial year, and up to December 15th, 1926, when the Act came into force, the cost was £19,000, making the total cost up to December 15th, 1926, £29,500. There would probably be a little more expenditure incurred after December 15th, and that would fall on the funds of the Electricity Commissioners, who would recover from the Central Board.

Mr. Hardie (Lab.) complained that the information obtained in the surveys had not been made use of in connection with the Act. Col. Ashley said that the greater part of it had been included, as it had been used in the preparation of the scheme. The other part would be used by the Commissioners when they drew up their schemes for the consideration of the Board when it began to function. All that he had done was to instruct the Electricity Commissioners to prepare a scheme and to place the work of survey in the hands of Messrs. Merz and Kennedy. Those eminent consulting engineers were to engage appropriate staffs to make that general survey of Great Britain, and when that was finished they were to go into much more detail with regard to the areas with which it was proposed to deal first—Central England and the Glasgow and Clyde area. Detailed examination of the two areas was nearly finished, so that the Electricity Commissioners would soon be able to put up one or two schemes for the Board to consider. It would not be for the consulting engineers, nor for the Electricity Commissioners, but for the Board, to decide what areas should be taken next. The scheme for the areas which he had mentioned would be presented to the Board in the next fortnight or so.

The vote was agreed to.

Legal.

Scarborough Electricity Supply Co., Ltd.

Mr. Justice Tomlin, in the Chancery Division on February 17th, heard a summons taken out by the Trust Union, Ltd., trustees for the debenture holders of the Scarborough Electricity Supply Co., Ltd., for a decision as to whether the debentures should be paid off at par or at 105 per cent.

Mr. Cleveland Stephens, for the applicants, said the company, in 1894, purchased the electricity undertaking from the Corporation, but the latter, under the terms of the transaction, re-purchased it in 1926. In 1923 the company issued £60,000 6 per cent. debentures, which were to be redeemed in certain circumstances at 100, 102, or 105.

Mr. Dighton Pollock, for the company, submitted that the debentures should be redeemed at par, but Mr. C. A. Bennett, K.C., for the debenture holders, argued that the redemption price should be 105.

His Lordship said the trust deed contained a clause providing for the repayment of the debentures on a resolution for liquidation of the company, otherwise than for amalgamation or reconstruction, but there was a proviso that if the liquidation was for either of those purposes, the debentures should not be repayable except at 105. That event, however, had not happened, and his conclusion was that the debentures, on the true construction of the deed, should be repaid at par.

Stonebridge Electrical Co. v. Magneta Time Co.

Mr. Justice Tomlin, in the Chancery Division, on February 14th, heard an application by the Stonebridge Electrical Co. to expunge from the register the trade-mark "Magneta" for electrical clocks. The respondents to the application were the Magneta Time Co., Carteret Street, Westminster.

Mr. Bray, for the applicants, said this was a motion by way of answer to an action for alleged infringement of trade mark. There was an affidavit in support of the application raising two grounds of objection to the mark being on the register. The first, which was not before his Lordship now, was that the mark belonged to a Swiss company of that name: and the second was, that the renewal of the mark had been invalidated in those circumstances. In 1908 the mark was registered in the name of the Magneta Time Company, which had offices at Turnham Green, but a receiver of the company's assets was appointed, and he joined in the assignment of the mark and the company's goodwill to a Mr. J. W. Molden. In November, 1917, the company was dissolved. In February, 1918, Mr. Molden assigned the goodwill and mark to the present company, but neither assignment was registered, and the mark, having been put on the register in 1908, the 14 years had elapsed and there had been no proper application for renewal.

Sir Duncan Kerly, K.C., for the respondents, said the assumption that the mark lapsed at the end of 14 years if there was no application for renewal of registration was incorrect. Such a case as this was provided for, and in any event he submitted that a mark remained on the register until it was removed.

His Lordship, in refusing the application, said the claim to expunge was based on a technicality. The error on which that technicality was founded was remedied in 1925, and apart from the technicality the present title to the mark was unimpeachable.

St. Austell Electric Light and Power Co. v. Beavis.

A case which had been before the County Court at four previous sittings was concluded at St. Austell on February 15th. The plaintiffs were the St. Austell Electric Light and Power Co., Ltd., who brought an action against Mr. A. H. Beavis in respect of rent for electric lighting fittings in a house of which he is the tenant, and also against Mr. Alfred Reed, the leaseholder, who claimed that the fittings became his when he bought the house. Mr. Reed further counter-claimed for a declaration that the fittings were his sole and absolute property, the claim of the company not having been brought to his notice when he purchased the property. His Honour Judge Gurdon found for defendants, with costs, with regard to the company's claims against Messrs. Beavis & Reed, and gave judgment for the company, with costs, on the counter-claim, holding that the freeholder had prior claim to the leaseholder.

American Electric Refrigerator Trade Activity.

The General Electric Co., of Schenectady, recently set up a separate department to handle its electric refrigeration business. The two refrigerator manufacturing plants which the company has been operating at Schenectady and Fort Wayne will be continued and expanded as the merchandising programme develops. According to the *Electrical World*, the G. E. electric refrigerator, which has been under development for the past fifteen years, is now being produced in two sizes for domestic use. The company's present plans call for a line of at least eight models of domestic refrigerators, ranging in price from $260 to $600. Some details are given of the merchandising system which will be followed. The new department will market refrigerators through electrical utilities, distributor-dealers and dealers. Distributor-dealers will sell direct to residential customers and also through sub-dealers in the territory allotted to the distributor. Most of the distributorships will be limited to one county or to a territory with a radius of not more than 25 miles. An extensive advertising programme, calling for an expenditure of $1,000,000 in 1927, has been planned, starting May 1st. "This includes a complete advertising service and sales assistance programme for distributors and dealers, consisting of co-operative newspaper advertising, direct-mail campaigns, booklets, publications, window displays and a full complement of dealer helps that will help distributors in localising the national campaign in leading national and trade journal publications."

Sales and Man Power.

Experience indicates that intensive sales efforts produce the best results. A large number of competent salesmen with a small number of prospective customers per salesman permits a degree of customer cultivation which results in maximum sales volume. In many cases, however, conditions are such that this policy must be modified seriously. A utility company may operate in a widespread territory where the income of the customers is limited. Again, competent salesmen are difficult to obtain and to retain unless they are paid a return greater than is warranted by the sales made. Thus the generalised statement on sales and man power is subject to modification in practice, but the principle is sound and should govern the development of sales programmes. The campaign method of sales or the use of specialty salesmen must be judged partly from this standpoint. A large group of refrigerator salesmen, for example, may be needed to sell the quota established for the sales period. It is a problem to get the men, and a still bigger problem arises at the end of the campaign period. A permanent sales staff is desirable, but large groups of specialty men are difficult to hold profitably during unseasonal sales periods or to adapt for selling general appliances. The summer campaigns create a heavy demand for salesmen, but the winter season calls for retrenchments and a slackening of some sales efforts. These points are doubtless kept in mind by utility sales managers in their efforts to stabilise the situation. Any individual plan for a single property must consider the man-power situation carefully and has to operate on the fundamental conception of building a permanent staff of salesmen who sell continuously and intensively.—*Electrical World*, February 5th.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Campaign Notes, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

E.D.A.-E.L.M.A. Campaign.

The official report, dated February 21st, states that local circles were formed at Swindon (chairman: Mr. Nicklen) and South-East London (chairman: Mr. Wilson). Three more demonstration houses were opened at Portsmouth, Bath, and Belfast. From 750 to 1,000 persons are visiting the last-named house daily. An all-electric "house" was to be opened at the Town Hall, Basingstoke, yesterday (Thursday), and free competitions for children and adults are being arranged. Peterborough and Bermondsey have decided to run demonstration houses, while Halifax is to open a further house early next month. In Scotland, a house was to be opened at Aberdeen this week, and another in Glasgow is to be opened by the wife of the Lord Provost on Monday next. In co-operation with the Salford Corporation, the Prestwich Urban District Council was to open a house on February 23rd. Other demonstration houses in prospect are at Blyth, Durham, Sunderland, South Shields, Whitley Bay, Whickham, and Saltburn. Messrs. Ward & Co., of Cardiff, are erecting an all-electric bungalow outside the Cardiff Drill Hall. This will be run concurrently with an Ideal Home Exhibition which is being held in the hall. Exeter reports a daily attendance of 1,500 people at the demonstration house; it is expected that the total will reach 20,000 before the end of the display. Exhibitions are being held at Bradford (first week in March) and Bingley (February 25th to March 12th). The period of the Dumfries exhibition has been altered to March 2nd to 5th. Good results are said to have been obtained from the Falkirk and West Hartlepool exhibitions. The large working model of the prize house has stimulated the demand for competition booklets in the Liverpool and Manchester districts. In the North-East Coast area an impetus has been given by the children's competition.

The latest of the exhibitions of the Shropshire, Worcestershire and Staffordshire Electric Power Co. was held at Halesowen, Worcestershire, and proved very successful. There were a large number of visitors each day, and lectures were given by Mr. J. L. H. Cooper, the campaign officer for the South-Midlands Area, and Mr. C. C. MacLeod, of the company. The exhibition was arranged on the lines of a model home, sections being devoted to the kitchen, dining-room, bedroom, and bathroom, and in each of these demonstrations were carried out, which were watched with a good deal of interest. The Singer Sewing Machine Co. arranged a series of demonstrations of sewing by electricity. Wireless demonstrations were given by the Cable Accessories Co., Ltd., and by Messrs. Shaw Bros., the Halesowen agents for Burndept Wireless, Ltd. In a small industrial section were shown electric welders by Messrs. Holden & Hunt, Ltd., electric tools and soldering irons by Messrs. S. Wolf & Co., Ltd., and an electrically-driven fan forge by Messrs. W. Alldays.

Over 7,000 people visited the all-electric house at Shawlands in one week.

An all-electric house was opened on February 19th by the Luddendenfoot Urban District Council, near Halifax. The local electrical contractors and the Yorkshire Electric Power Co. (which supplies the Council with electricity in bulk) have co-operated in the organisation of the exhibition. The house was wired by the Electrical Distribution of Yorkshire, Ltd. The dwelling is one of the Council's parlour type, with three bedrooms and bathroom.

The Paisley Corporation Electricity Department recently held an exhibition of domestic electrical apparatus with the twofold object of advertising the new temporary showrooms and of furthering the campaign. The complete range of radiators, cookers, water heaters, &c., hired out by the Department was on view, along with the many other domestic appliances which may be purchased or hire-purchased. A good attendance was secured, and all who went were seriously interested in the electrification of their homes. Many hired appliances were booked out and numerous inquiries were received regarding the Corporation's scheme of hired installations. Every visitor to the exhibition was presented with a competition booklet.

Last week the Lady Mayoress of Belfast (Lady Turner) opened a demonstration house in Balmoral Avenue, organised by the Belfast Circle. This is a new villa lent by the builders (Messrs. A. M'Dowell & Co.), furnished by Messrs. Robert Watson & Co., and the electric wiring and fittings have been supplied by local electrical contractors and wholesalers. Presiding at the opening ceremony, Councillor Hyde said that, whilst during the past few years very considerable progress had been made in Belfast in the use of electricity for power, heating, and lighting, there was still much development work to be done.

The fifth Birmingham electric demonstration house, which is situated at Erdington, was opened by Lady Brooks on February 9th. A view of the house accompanies this note. The dwelling is floodlighted at night.

The Erdington Demonstration House.

An electrical exhibition, organised by local contractors along with Mr. W. Johnston, manager of the municipal electricity works, is to be held in St. George's Hall, Dumfries, from March 2nd to 5th. A complete electric kitchen will be on view, and there will also be a model shop window showing correct and incorrect methods of lighting, as well as a small electric laundry.

Aden as an Electrical Market.

Industrie und Handelszeitung (Berlin) reports that Aden is an excellent market for electrical apparatus. At the beginning of last year the town was provided with electricity, and new installations are still being carried out in large numbers. Not only are lamps required, but also fans, refrigerators, and many novelties.

Shop-Window Lighting Enterprise.

The *Huddersfield Examiner* reports that a local firm of bootmakers has installed a novel shop-window lighting system. Anyone who wishes to see the goods in the window when the shop is in darkness has only to press a button situated outside when the lights are switched on and remain on for a minute. The firm is to be commended on its enterprise—an opinion which will be endorsed by all the small boys in the neighbourhood.

The Scottish Lighting Service Bureau.

The first annual report of the Scottish Electric Lighting Service Bureau states that the number of people who attended the lectures at the Bureau was 1,711, while 962 people called for advice. The number who attended other lectures arranged by the Bureau was 882, making a total of 3,555. Free advice has been sought and given, states the report, on a great number of problems in illuminating by electric light in a diversity of directions.

New Belgian Company.

A company has lately been formed at La Louvière with a capital of two million francs and the title La Société Tréfilerie et Câblerie du Centre, to manufacture electric cables of all kinds.

Bermondsey Strike Settled.

The strike of outside employés of the Bermondsey Electricity Department appeared to be settled on February 17th. The Electrical Trades Union decided to accept as a member the man who was the subject of the strike, but at the same time it claimed that all men in the electrical installation department should become members. The matter was to be referred to the Trade Union Congress for its decision, which both the E.T.U. and the Borough Council agreed to abide by. Pending this decision, no men other than members of the E.T.U. were to be employed in the installation department. Later, however, it was reported that the man had refused to join the E.T.U., preferring another union. At the time of going to press the strike continued, but negotiations were proceeding.

A Lamp-Renewal Complaint.

The *Electragist* reports that a contractor-dealer in Hartford (Conn.), U.S.A., has applied for an injunction restraining the Hartford Electric Light Co. from exchanging and renewing lamps for a small fee, alleging that by this means the company has secured a monopoly of the "Mazda" lamp business inthe town, to the detirment of electrical dealers. It is further alleged that the loss of the lamp business has resulted in the loss of other business by the retailers. An agreement between the company and electrical dealers providing that the latter shall receive commission on the sale of appliances is held to be illegal.

Astoria Theatre Lighting.

The electric light fittings, some of which are five and six feet in diameter, installed in the new Astoria Theatre, London, are of excellent design. In collaboration with the electrical contractors, the Berkeley Electrical and Engineering Co., the General Electric Co., Ltd., designed and supplied the large fittings in the auditorium, together with electroliers and basket fittings for the foyer. These are designed on triple circuits for the use of multi-coloured lighting, which is controlled by means of dimmers.

Local Exhibitions.

Ayr.—Ayr merchants and manufacturers are to hold an exhibition in the Pavilion, Ayr, from March 7th to 12th. Among the firms exhibiting will be the Eureka Vacuum Cleaner Co., Messrs. W. G. Dodd, Ltd., electrical and radio engineers, Messrs. Fairbairn, Ltd., radio experts, and Mr. Wm. Ross, electrical and radio engineer.

West Hartlepool.—Mr. J. H. Parker, the electrical engineer of West Hartlepool, says that the local Co-operative Society has just held an exhibition to demonstrate that it is able to provide for the needs of the whole of the population. Included in the exhibit was a bakery section and café; the Borough Electricity Department loaned the Society three large ovens and two hot plates, total 30 kW, besides other electrical appliances. The exhibition ran for 10 days and was crowded out daily. The operation of all the working stalls was entirely electrical; there was no gas used on the premises. The exhibition has now been transferred for 10 days to the neighbouring borough of Hartlepool.

Price Reductions.

Messrs. F. C. Blackwell & Co., Ltd., Great Crosby Works, Liverpool, announce a large reduction in the price of the "Blaco" all-steel continuity fitting, in consequence of increase in demand and production and improved methods of manufacture.

Messrs. A. Reyrolle & Co., Ltd., announce a reduction in the price of their plugs and sockets, due to still further improvements in details of manufacture, and they are able to supply quantities from stock in any required finish.

Callender's at Leipzig.

Among the British companies which will be represented at the Leipzig International Industries Fair (March 6th to 12th) is Callender's Cable & Construction Co., Ltd.

New B.T.-H. Factory.

For the rebuilding of the section of the British Thomson-Houston Co.'s works at Rugby, which was recently destroyed by fire, the company is preparing plans for a factory, to be erected on the site of the old one, which will meet modern needs much more effectively. The old factory was built twenty years ago.

The Floodlighting of Quarries.

At the Barnhill Quarries, near Bristol, a number of G.E.C. standard floodlight projectors have been installed. These are equipped with 1,000-W "Osram" gasfilled projector-type lamps, and night shifts are being worked regularly with excellent yield results. These floodlights, which are portable, are used in conjunction with a number of G.E.C. Wembley lanterns, and electricity is generated by the quarry plant, which includes a G.E.C. alternator. The whole of the cables, fittings, and lamps have been supplied by the General Electric Co., Ltd., Magnet House, Kingsway, W.C.2, the installation being carried out by Messrs. Rouch & Penny, electrical contractors, Bristol. Similar lighting has also been installed at the Town Quarries, Weston-super-Mare. In these workings the floodlight projectors are being fixed permanently by Messrs. Crowe & Green, the contractors.

Lamp Syndicate Developments.

It is announced that the Phoebus Company, of Zurich, which is one of the chief representatives of the International Glow Lamp Syndicate, has acquired by purchase the "Meteor" electric lamp works in Vienna, which has been one of the few works outside the scope of the syndicate. Negotiations are also proceeding with other outside firms, as, for instance, Gustav Glanz & Company, with a view to their inclusion in the syndicate.

The Prince Visits Hackney.

The Prince of Wales paid a visit to the Hackney municipal electricity works on February 15th at about 10 p.m. Upon his arrival the Prince was met by Alderman Mrs. Hammer (chairman of the Electricity Committee), Councillor W. J. Stapleton (vice-chairman), and Mr. L. L. Robinson, the borough electrical engineer. His Royal Highness displayed keen interest in the various parts of the works and chatted with the men on duty.

Factories.

Messrs. Leopold Farmer & Sons, of 46, Gresham Street, London, E.C.2, who, as our readers know, have a good deal to do with the letting and sale of factory and other business premises, report a very good demand at the present time for commercial property both in the provinces and in the London area and suburbs. This suggests that business is on the up grade and that further activity may be anticipated. We have received a copy of a paper on "Factories and Something About Them," which was read before the Auctioneers' and Estate Agents' Institute in December last by Mr. Harold L. Farmer.

State Aid for Japanese Engineers.

The Japanese committee for the promotion of home industries, appointed last year, has made a number of recommendations to the Government with regard to machinery manufacture. It recommends that the State should contribute towards the cost of training a body of technicians and mechanics, that State premiums should be paid in respect of well-equipped workshops whose products reach a prescribed standard, and that experimental and model workshops should be planned. It is also suggested that local associations of manufacturers should be formed with a view to improving the methods of production and organisation.

German Holdings in Russia.

It is stated that the shares of the former Russian General Electricity Company are still being dealt in, in the open market in Berlin, the valuation being put at about 4 per cent. In this connection Herr Deutsch, on the occasion of a recent interview, is reported to have been asked whether these shares were of any value. In reply, the director of the A.E.G. said that the shares were worthless, and there was not the slightest prospect that the shareholders would ever receive any return. It could not be thought that the Russian Government, which in general had expropriated capital, would return to that particular company a part of its property.

German Interests in Czecho-Slovakia.

It is reported that the conversion of the partnership company of Siemens & Co., of Prague, into a joint stock company, is to be accompanied by an extension of the interests of the German Siemens concern. The Prague company will receive considerable funds from the Siemens & Halske Company for the purpose of carrying out the conversion. Moreover, an enlargement of the Muglitzer works is contemplated; this works was recently amalgamated with Siemens & Co. It is also stated that the Siemens concern is about to acquire further interests in other Czech electrical undertakings.

Social Events.

The Meter Section of Blackpool Electricity Department held its second annual dinner on February 16th. Mr. E. Donoghue (charge engineer), who presided in the absence of Mr. C. Furness, general manager, spoke of the busy times which would be introduced by new legislation and the commercial development of electricity. Thanks were extended to Mr. Jackson, the organiser.

The second annual dinner of the employés of the Shropshire, Worcestershire and Staffordshire Electric Power Co. was held at Handsworth, Birmingham, last week, and about 250 were present from the company's headquarters and district stations. Mr. T. E. Boothby, the superintendent engineer, presided, and the toast of the company was proposed by an old servant, Mr. W. T. Penny. In response, Mr. J. T. H. Legge recalled the earliest days of the company, and expressed appreciation of the work of all who had assisted in carrying on the company's operations.

Recent Contract.

International Combustion, Ltd., states that its associate, S. A. Foyers Automatiques, Paris, has obtained a contract for a complete "Lopulco" installation to be installed at the Alost plant of the Société Générale de Soie Artificielle "Viscose." This order covers the supply of "Raymond" pulverising equipment, "Lopulco" hollow wall air-cooled combustion chambers with water screens, feeders, piping, burners, and electrical equipment. The normal rating of the boilers is 14,000 kg. per hour, with a peak-load rating of 18,000 kg. per hour.

Unemployment.

There was again a decrease (28,040) in the number of registered unemployed during the week ended February 7th. At that date the total was 1,303,500, as compared with 1,331,540 on January 31st, and 1,164,960 on February 8th, 1926.

The Wareham Electric Supply Co. : Petition for Compulsory Liquidation.

On Tuesday, before Mr. Justice Romer, the petition of Mr. W. E. Weston for the compulsory liquidation of this company was considered. Counsel said that it was a very serious case, a very gross fraud having been perpetrated. As further evidence was necessary, his Lordship adjourned the petition for 14 days for the necessary affidavits to be filed.

Calendars.

The 1927 calendar of Messrs. W. G. BEAUMONT & SON, Priory Works, Bow, E.3, bears monthly slips and a large coloured humorous drawing.

From the DELTA-STAR ELECTRIC Co., Chicago, U.S.A., we have received a 1927 calendar bearing a view of the company's 750,000-V testing laboratory. The company has also sent us one of its "bulletins" dealing with outdoor sub-stations.

Trade Announcements.

MR. C. F. MACKNESS, M.I.E.E., has removed from 37, Norfolk Street, Strand, W.C., to 28, Victoria Street, S.W.1. Telephone No.: Victoria 9355.

MESSRS. GREENWOOD & BATLEY, LTD., of Leeds, have appointed Messrs. Haslam & Stretton, Ltd., of 11, Windsor Place, Cardiff, to represent them in the South Wales district for the sale of their De Laval steam turbines up to 600 h.p., electric generators, a.c. and d.c., electric motors, traction motors, &c.

The business of BRITTAIN'S ELECTRIC MOTOR Co. (formerly Langdon-Davies Motor Co.), has been purchased and will be carried on at Eastdown Works, Dermody Road, Lewisham, S.E.13, by Mr. H. W. Hitching, as heretofore. Mr. Hitching has held the position of general manager for the last 15 years.

New Catalogues and Lists.

MESSRS. HOUGHTON-BUTCHER (GT. BRITAIN), LTD., 88-89, High Holborn, W.C.1.—"Radio News" for February, containing notes on the radio trade, details of new devices, and price lists.

ELECTRICARS, LTD., Landor Street, Birmingham.—An illustrated brochure dealing with storage-battery transport in industry and a pamphlet describing the company's refuse-collecting, &c., vehicles.

THE BRITISH THOMSON-HOUSTON Co., LTD., Rugby.—A reprint of an article from the *Illustrated London News* dealing with successes of cars fitted with "B.T.-H." magnetos.

HIGGS MOTORS, Witton, Birmingham.—February stock list of a.c. and d.c. motors. Priced.

MESSRS. SPENCER (MELKSHAM), LTD., Melksham, Wilts.—An illustrated brochure dealing with the company's machinery for handling materials in bulk.

THE MULLARD WIRELESS SERVICE Co., LTD., Mullard House, Denmark Street, W.C.2.—Four illustrated leaflets giving particulars and characteristic curves of the company's transmitting, modulating and rectifying valves.

MESSRS. E. BROOK, LTD., Empress Works, Huddersfield.—Pamphlet No. 119, containing notes on the company's production methods and illustrations of the works.

MESSRS. E. P. ALLAM & Co., LTD., 107-109, Gray's Inn Road, W.C.1.—A monthly stock list of motors for sale or hire.

MESSRS. SCOTT & HODGSON, LTD., Guide Bridge Iron Works, near Manchester.—A well-illustrated catalogue of the company's products, including a 12,000-i.h.p. mill steam engine, large rope pulleys, spur wheels, steel shears, rolling-mill drives, &c.

THE CAPAC Co., LTD., 11, Willow Avenue, Barnes, S.W.13.—An illustrated booklet describing the "Capac" binaural equipment for testing the internal conditions of machinery.

THE GENERAL ELECTRIC Co., LTD., Magnet House, Kingsway, W.C.1.—Leaflets Nos. 219, 259, and Y4,374, dealing respectively with field regulators, high-speed circuit breakers, and the "D.B. Minor" d.p. switch and fuses. Fully illustrated. Also Pamphlet O.S.4,366, dealing with the "Osram" Pearl" lamp, which is now made in the 100-W size.

SANTON, LTD., Dock Street, Newport, Mon.—An illustrated pamphlet describing the "Santon" electric belt for application to ordinary cylindrical tanks for water-heating purposes. Priced.

THE STANDARD INSULATOR Co., LTD., Winsley House, Wells Street, Oxford Street, W.1.—A brochure and a series of illustrated pamphlets dealing with "Rockbestos" (asbestos covered) wires and cables, for which the company are the sole agents for Europe (excluding Norway and Sweden).

THE NORMAND ELECTRICAL Co., LTD., 3, North Side, Clapham Common, S.W.4.—A leaflet setting forth one hundred and one uses for "Neco" fractional h.p. motors.

MR. A. H. GOWER, 23, Benbow Road, The Grove, Hammersmith, W.6.—A price list of "Ferrowatt" and other lamps and radio valves.

MESSRS. HOLLINGS & GUEST, LTD., Thimble Mill Lane, Birmingham.—A series of illustrated catalogues (priced) of the company's hydraulic presses, industrial stoves, &c.

MR. ALAN WRIGHT, 124, Chancery Lane, W.C.2.—An illustrated pamphlet describing "Hazemeyer" dimmers and regulators for kinemas and theatres. Priced.

Bankruptcy Proceedings.

F. C. SNOOK, 66, High Street, Plumstead, S.E.18, lamp shade manufacturer.—The public examination of this debtor was held recently. The statement of affairs showed liabilities of £898 against assets of £68. The debtor commenced business on his own account in March, 1923, at which time he was experimenting with some electric lighting devices. The business was successful until he became short of working capital. A limited liability company was formed in July, 1926. Debtor said that he was to receive a weekly salary, and he intended to make his creditors an offer. The company had since gone into voluntary liquidation, but he would get substantial compensation under a service agreement. The examination was adjourned.

E. W. KIRK (ACE RADIO MANUFACTURING Co.), wireless apparatus maker, 26, Curzon Street, Derby.—Receiving order made February 9th on debtor's own petition. First meeting held February 24th at the Official Receiver's offices, 4, Castle Place, Nottingham. Public examination, March 22nd, at the Court House, Derby.

E. O. HENSTOCK, electrical engineer, 21, Old Road, Brampton, Chesterfield.—Trustee, Mr. L. A. West, Official Receiver, 4, Castle Place, Nottingham, released February 8th.

C. W. WATSON, electrical and wireless engineer, 33, Rainhall Road, Barnoldswick, Yorks.—Last day for proofs for dividend, March 1st. Trustee, Mr. J. O. Morris, Official Receiver, 12, Duke Street, Bradford.

E. D. S. MUNDAY, electrical engineer, 272, Lake Road, Portsmouth.—First and final dividend of 2s. 4¾d. in the £, payable February 28th at the Official Receiver's office, 87, High Street, Portsmouth.

J. REFOY (Varley Radio Co.), dealer in wireless apparatus, 178, Ancona Road, Plumstead, S.E.—Trustee, Mr. T. Gourlay, Official Receiver, 29, Russell Square, W.C., released February 10th.

Company Liquidations.

RADIO (HOVE), LTD., manufacturers of radio apparatus, Westbourne Place, Hove, Sussex.—A meeting of creditors was held on February 15th at the offices of Messrs. Painter, Mayne & Walker, Cannon Street, E.C., when Mr. A. C. Gillman, the liquidator of the company, presented a statement of affairs which disclosed assets estimated to realise £117. That amount was insufficient to fully discharge the claims of the debenture holders and preferential creditors. There was a deficiency as regarded the debenture holders of £161, and there were no assets available for the unsecured creditors, who were scheduled for £223. The company had created debentures for £200, bearing interest at the rate of 10 per cent. per annum, and £25 was owing in respect of interest. No resolutions were passed, and therefore the voluntary liquidation of the company will be continued with Mr. Gillman as liquidator.

RADIO CABINETS, LTD., Whitehorse Yard, Essex Road, N.1.—A meeting of the creditors was held on February 15th, when it was decided that the voluntary liquidation of the company should be continued with the present liquidator, Mr. Hibbert. An advisory committee was also appointed.

NEUTRON, LTD.—Winding up order made by the High Court on February 15th.

BRITISH WIRELESS SUPPLY Co. (1924), LTD.—Last day for proofs for preferential claims for dividend, March 5th. Liquidator, Mr. H. H. Busfield, 12, Northgate, Bradford.

SOUTHERN COUNTIES ELECTRIC LIGHT AND POWER SUPPLY, LTD.—A petition for the winding up of this company has been presented to the High Court by Messrs. D. Gestetner, Ltd., of Aldwych House, Aldwych, W.C., creditors, and will be heard in London on March 1st.

Dissolution of Partnership.

ALLEN & EDWARDS, electrical and mechanical engineers, 106, Albany Street, N.W.—Mr. G. Allen and Mr. F. R. Edwards have dissolved partnership. Mr. Allen will attend to debts and will continue the business under the style of G. Allen and Co.

Receiver Appointed.

ACCUMULATORS OF WOKING, LTD.—On February 16th Mr. H. Tansley Witt was appointed receiver on behalf of the debenture holders.

United States Exhibitions.

The sixth annual Electric Sign Show was held in the New York Edison Co.'s showroom from February 14th to 19th, and over 200 signs and advertising devices were displayed. Other exhibitions which are being held at the company's showroom are the seventh annual Electric Truck Show (March 14th) and the fifth annual Electric Power Show (February 28th to March 5th).

New Cable Company.

We have received from Messrs. Century Cables, Ltd., of 137, Victoria Street, London, S.W.1, an announcement of the registration of which appears in our "Financial Section" to-day, a pamphlet entitled "The Making of Electric Cables." It contains aerial and exterior views of works which have been purchased at Addlestone, Surrey, for the manufacture of all types of cables, and gives a brief description of the operations of cable manufacture, accompanied by a number of pictures of cable-making machinery.

Book Notices.

In *Electrical Communication* for January an interesting article by Mr. Rollo Appleyard appears, on André Marie Ampère; the life story of the great French mathematician and physicist, who discovered and established on a sound basis the fundamental laws of electro-dynamics, is told in masterly fashion.

To the same issue Mr. J. E. Kingsbury contributes some personal reminiscences of Charles E. Scribner, the inventor of the multiple telephone switchboard and a telephone engineer of the first rank, who introduced the "common-battery" system of working into this country in 1900.

The price of the Post Office Electrical Engineers' *Journal* to annual subscribers has been reduced to 5s. per annum, postage extra; single copies will still be 1s. 6d. each, and this price will appear on the cover. The new price comes into force with the April issue, the size of which will be altered, forming the first part of Volume XX.

"The *Mechanical World* Electrical Pocket Book, 1927." Pp. 400; figs. 133. Manchester: Messrs. Emmott & Co., Ltd. Price 1s. 6d.—This new issue has been revised and brought up to date. New sections have been added, including one on a.c. commutator motors, in which the principles of construction of various types are described and illustrated. Another interesting feature is a chapter on electric lighting and power in villages, in which various systems of supply are considered and many data given.

"Double Helical Gearing." By the technical staff of Messrs. David Brown & Sons (Hudd.), Ltd. Pp. ix+134; fully illustrated. Published by the above company.—This is the second of a series of treatises on the design, manufacture, and application of double helical gearing, with special reference to DBS reducing gears and turbine, haulage and rolling-mill gearing. This well-written and useful book is available to all responsible engineers and executives on receipt of 1s. to cover the cost of distribution.

"Electrical Condensers," by P. R. Coursey. Pp. xxiv+637; 514 figs. London: Sir Isaac Pitman & Sons, Ltd. Price 37s. 6d. net.

"Deafness Explained," by C. M. R. Balbi. Pp. 46; illustrated. London: John Bale, Sons & Danielsson, Ltd. Price 1s. net.

"X-Rays, Past and Present," by V. E. Pullen and W. J. Wiltshire. Pp. 14+229; figs. 43. London: Ernest Benn, Ltd. Price 12s. 6d. net.

"*Journal* of the Institution of Electrical Engineers." Vol. LXV, No. 362. February, 1927. London: E. & F. N. Spon, Ltd. Price 10s. 6d.

Scientific Papers of the U.S.A. Bureau of Standards. No. 539, "Radiometric Measurements on the Carbon Arc and other Light Sources used in Phototherapy." (15 cents.)

"The Purification of Industrial Waters" (107 pp.; 69 figs.). London: The Paterson Engineering Co., Ltd.—Although this deals particularly with the company's own apparatus, it is in the nature of a treatise upon the subject of water purification. A number of methods of treating boiler-feed water, &c., are explained in non-technical terms.

Transactions of the Institution of Engineers, Australia. Vol. V, 1924. Sydney: The Institution.

"*Journal* of the American Institute of Electrical Engineers." Vol. XLVI. No. 2. February, 1927. New York: The Institute. Price $1.

Continental Wire Trust.

It is announced that in the course of meetings held last week at Cologne, delegates of the wire-drawing companies of Germany, Belgium, Czecho-Slovakia, and Holland decided to ratify once more the present agreement only so far as concerns the prices to be fixed for each group and their quotas for export. There is no change in the present prices. The provisional agreement came into force on February 15th, and will in the near future be transformed into a definite international agreement to remain in force for several years.—*Reuter* (Brussels).

New Italian Company.

A new company has been formed at Benevento with a capital of 200,000 lire, and the title La Società Elettrica del Vitulanese.

The Economics of the Electrical Industry.

The British Electrical and Allied Manufacturers' Association has prepared a "Monograph on the Electrical Industry" for presentation to a committee preparing matters for the consideration of the International Economic Conference of the League of Nations. This surveys the world production of electrical goods and the markets for them; deals with developments in organisation and technique; and with production costs and selling prices. A mass of useful statistics is tabulated in various forms.

The Norwegian Electrical Market.

In the course of a survey of the Norwegian import markets, the Oslo correspondent of the Federation of British Industries says that British radio material is in good demand, but the United States and Germany are strong competitors. The demand for electrical heating and cooking apparatus is mainly met by Norwegian manufacturers.

New Indian Company.

A company has recently been formed at Aligarh, United Provinces, with a capital of 10,000,000 rupees and the title of the Aligarh Electric Supply Co.

For Sale.

Liverpool Electricity Supply Department invites offers for a number of second-hand d.c. motors. The County of Dublin Commissioners have for disposal two Corliss valve compound steam engines, coupled to two 500-kW alternators, and one Alley & McLellan surface condenser, &c. (See our advertisement columns to-day.)

Prices of Raw Materials.

The following prices are only general, and they may vary according to quantities and other circumstances:—

	CHEMICALS, &c.	Price Feb. 22nd.	Fortnight's inc. or dec.
a	Acid, Oxalic ... ... per lb.	5¾d.	...
a	Ammoniac, Sal ... ... per ton.	£60	...
a	Ammonia, Muriate (large crystal) ,,	£52	...
a	Bisulphide of Carbon ... ... ,,	...	...
a	Borax ... ... ,,	£25	...
a	Copper Sulphate ... ... ,,	£25 10s.	...
a	Potash, Chlorate ... ... per lb.	4d. to 4½d.	...
a	,, Perchlorate ... ... ,,	5½d.	...
a	Shellac ... ... per cwt.	£13 10s.	...
a	Sulphur, Commercial ... ... ,,	£9 10s.	...
a	,, Roll ... ... ,,	£9 10s.	...
a	Soda, Chlorate ... ... per lb.	3½d. to 3¾d.	...
a	,, Crystals ... ... per ton.	£5 to £5 5s.	...
a	Sodium Bichromate, casks ... per lb.	4d.	...
	METALS, &c.		
b	Aluminium, Ingots... ... ... per ton.	£107 to £112	...
b	,, Wire ... ... per lb.	1/6 to 2/-	...
b	,, Sheet ... ... ,,	1/3 to 2/9	...
p	Babbitt's Metal and Anti-friction Metal—		
	Grade I ... ... per ton net.	£271	£4 inc.
	Grade II ... ... ,, ,,	£187	£2 inc.
	Grade III... ... ... ,, ,,	£96	...
c	Brass (rolled metal 2" to 12" basis) per lb.	9⅝d.	...

Lighting and Power Notes.

Alloa.—Transfer of Undertaking.—The Town Council has given notice of its intention to transfer its electricity undertaking to the Scottish Central Electric Power Co. The transfer is to be made as from January 1st last, and the purchase price is £100,000.

Bedford.—Electricity in Bulk.—For the purpose of affording a bulk supply of electricity to the Bedfordshire, Cambridgeshire and Huntingdonshire Electricity Co., the Corporation Electricity Committee has recommended the sale to the company of land at Sandy for erection of a sub-station.

Chile.—Hydro-Electric Scheme.—A contract has been concluded between the Santiago Traction and Lighting Co. and the Compañia Chilena for the construction of a hydro-electric plant on the Maipo River, with a minimum capacity of 22,000 kW. The power available from this river is approximately 70,000 kW, which will be barely sufficient for immediate purposes, which include electricity for 25 miles of the Transandine Railway. Other sources will therefore have to be found. The growth of the supply of electricity in Santiago to the State railways and other consumers has been very rapid, sales having increased from 55,000,000 kWh in 1922 to over 120,000,000 kWh in 1926.—*Reuter's Trade Service* (Santiago).

Clitheroe.—Electricity Supply.—The electricity supply for the district is to be formally inaugurated on March 3rd. The h.p. cable is to be extended to Chatburn, where the charges will be 8d. per kWh for lighting and 2d. per kWh for heating, cooking, and power.

Continental.—Switzerland.—The Geneva correspondent of *The Times* reports that the recent completion of the Vernayaz power station of the Swiss Federal Railways—in Canton Valais—brings to an end the construction of the Barberine-Vernayaz hydro-electric plant, the largest in Switzerland. Its aggregate capacity will be over 180,000 h.p. The construction and equipment of the Barberine-Vernayaz plant has cost nearly £1,600,000, and the electricity produced is transformed on the spot and distributed to the railways by several sub-stations. The greater part of the power goes to the electrified lines of Western Switzerland, while a small part is transmitted 80 miles northwards to feed the lines of Northern Switzerland. The plant is also connected with the Amsteg-Ritom plant, on the St. Gothard line, a distance of 100 miles, so that its power can be distributed all over the network of the Swiss railways.

The municipal authorities of Geneva have received Government authority to "export" electricity to industrial works in the Bellegarde district of France. The concession, which is to remain in force until the end of 1930, provides for a maximum export of 2,000 kW, the daily quantity supplied not to exceed 48,000 kWh, and this only during the April-September period.

Andorra.—The Sociedad Electro-Harinera Andoranna is establishing a central power station for the supply of electricity in the Republic.

Germany.—Considerable developments have been made in the electricity supply industry in Germany. The largest electricity supply concern is the Elektrowerke Gesellschaft, of Berlin, whose 110,000-V lines supply the whole of the Central German industrial area. The annual output now amounts to 1,577,000,000 kWh. In 1925 the company extended its power stations to a capacity of 400,000 kW and added several hundred miles to its h.p. network. The Sachsischewerke, controlled by the Free State of Saxony, is connected up to the stations of the Elektrowerke. The Saxon concern has a lignite power station at Hirschfelde, with a capacity of about 100,000 kW, and a second lignite station is under construction near Leipzig. In 1925 the output amounted to 386,000,000 kWh. In addition, a supply of 156,000,000 kWh was taken from the Elektrowerke. The company paid a 10 per cent. dividend on the share capital of £1,000,000. The Rhenisch-Westfalische Elektrizitatswerk, of Essen, increased its output during 1924-25, by 60 per cent., to 1,099,000,000 kWh. The total capacity of the power stations of the company is 475,000 kW, of which 290,000 kW is accounted for by the Goldenbergwerk, near Cologne.

Darlington.—Electricity Supply.—The Rural District Council has given permission to the Corporation to supply electricity within the parishes of Blackwell and Hurworth and Croft, and to the Cleveland and Durham County Electric Power Co. to supply electricity to Brampton, Great Burdon, Haughton, Morton Palms, Neasham, Sadberge, Whessoe, and nine other parishes.

East Grinstead.—Electricity in Bulk.—The Urban District Council has been informed by the borough electrical engineer of Tunbridge Wells that it is hoped that a bulk supply of electricity for the district will be available by next autumn. The scheme will also include Crowborough.

Glasgow.—Hire-Purchase Scheme.—The manager of the electricity undertaking has reported to the Sub-Committee on Propaganda that the Corporation has adopted a ten-year hire-purchase wiring scheme. The sub-committee has recommended that he be authorised to expend a small sum in advertising the scheme.

Progress during January.—During January 106 houses were wired under the Electricity Department scheme, making the total to date 3,236, and there were 251 applications for the hire of domestic appliances, making the total to date 14,279.

Gravesend.—Loan.—The Town Council has applied for sanction to a loan of £12,647 for the installation of a new boiler at the electricity works, which has already been ordered.

Street Lighting.—The lighting in certain streets is to be improved at an estimated cost of £1,150.

Ilford.—Loan.—The Electricity Committee is applying for sanction to the borrowing of £50,000 for mains and services.

India.—Pykara Hydro-Electric Scheme.—The Pykara scheme, which is the largest hydro-electric scheme in the Madras Presidency, was submitted to Messrs. Merz & McLellan for investigation. They have made their report, recommending the Government to begin by first supplying electricity in the area round about Pykara with a view to creating some demand for it, and afterwards to proceed with the electrification of railways which, in their opinion, should be a secondary object. They have also expressed the view that the scheme has been under-estimated, and they have advised the Government to ascertain beforehand what the actual power requirements would be near the source before launching the scheme. The Government has appointed an expert committee, which, it is reported, has been successful in obtaining the support of cotton and other mills in the neighbourhood.—*Reuter's Trade Service* (Bombay).

Inverness.—Purchase of Plant.—On the recommendation of the Electricity Committee, the Town Council has agreed to purchase the Bught hydro-electric plant and acquire the water rights for £850.

Irish Free State.—The Shannon Scheme.—It is understood that the erection of masts in the Dublin to Waterford loop of the Shannon scheme is to be begun immediately. Electricity will be transmitted at 38,000 V from Dublin to Bray, Wicklow, Arklow, Wexford, New Ross, and Waterford. From Waterford the line will pass through Kilkenny to Carlow, Athy, Maryborough, Kildare, and Dublin. The route has been surveyed, and the masts have been placed in readiness for erection.

Lichfield.—Mains Extensions.—The City Council is to carry out mains extensions to various parts of the city, at a cost of £4,550.

London.—St. Marylebone.—The Electricity Committee has received a report from the borough electrical engineer on the future development of the electricity undertaking, in which he states that the five 2,000-kW Parsons turbo-generators installed at Richmond Street station are more or less obsolete, and a considerable saving in working costs, as well as increased generating capacity, would result from the replacement of the whole of this plant. The two 3,500-kW Oerlikon turbo-alternators, although serviceable for some years yet, occupy space which could be used to better advantage. He has recommended the installation of two 20,000-kW turbo-alternators, &c., at an estimated cost of £174,000, in place of two 2,000-kW sets and two 3,500-kW sets. This proposal provides an installed capacity of 74,500 kW, and approximately 50,000 kW of demand capacity. The scheme would be carried out in two stages, and the second stage would include additional boiler and cooling-tower plant, at an estimated cost of £30,500. He also gave figures showing the difference in favour of generation on site with increased bulk supply. The Electricity Committee has recommended that the report be submitted to the Electricity Commissioners and that they be informed that the Council would be prepared to apply for approval to plant extensions and for loan sanctions for the expenditure involved. Sanction has been received to a loan of £29,966 for the acquisition of property in Aybrook and Blandford Streets for electricity purposes.

Hammersmith.—The Electricity Committee has recommended to the Borough Council that a supply of electricity be provided for the Wormholt housing estate of the L.C.C., and that the Council undertake the wiring of the houses to be erected, the total cost of the scheme being £19,083, made up as follows:—Wiring installation of 662 houses, £6,102; h.p. and l.p. mains, £8,517; provision and equipment of sub-stations, £823; services, £3,641.

Islington.—The Finance Committee has recommended that application be made for sanction to a loan of £29,137 for new boiler plant at the electricity works.

Bermondsey.—The Electricity Committee is applying for sanction to loans of £22,000 for mains and services, £5,000 for meters, and £10,000 to cover capital expenditure during the year.

Hackney.—The Electricity Committee has recommended that the increase of 25 per cent., made in certain electricity charges owing to the higher cost of coal, be withdrawn.

Southwark.—The inquiry into the Borough Council's application for sanction to extend its power station was concluded on February 11th. Mr. S. Morse, for the London Power Co. and the County of London Electric Supply Co., Ltd., who were opposing the application as ratepayers, states that his clients had powers to supply in certain parts of the borough, and the fact that the Council had within its area the mains of three companies, each with large generating resources, and able to give the whole supply required by the borough, made the extensions proposed by the Council unnecessary. Evidence was called to show that a bulk supply would be more economical in the interests of the ratepayers than incurring expenditure for the purpose of extending the existing system controlled by the Borough Council. An expert witness pointed out that the acceptance of bulk supply would relieve the Council of certain responsibilities, substantially reduce the expenditure, and would, therefore, be of all-round benefit to Southwark. The Electricity Commissioners will give their decision in due course.

Louth.—Electricity in Bulk.—The Town Council has asked Grimsby Corporation for the lowest terms upon which it would give a supply of electricity in bulk.

Middlesbrough. — Electricity Supply. — The Electricity Commissioners' decision relative to the Corporation's application for sanction to borrow £140,000 for the erection of a new generating station has not yet been received. Meanwhile there has been correspondence between the Corporation and the Cleveland and Durham Power Co., which now provides a bulk supply. The Corporation has informed the company that, while its second offer for a supply is an improvement upon the first, the conditions have not changed, and the result of the Commissioners' inquiry is awaited. The Corporation is still open to negotiate even if sanction to erect its own power station is received.

Milnrow.—Loan.—The Urban District Council has applied for sanction to a loan of £1,830 for extending the electricity supply on the Holt estate and to the Newhey Brick Co.

Northern Ireland.—Portadown (Co. Armagh).—A deputation from the Town Council and consumers, which waited on the managing director of the Portadown Electric Co. with regard to the emergency that has arisen owing to the destruction of the power station by fire, was informed that some days must elapse before the company could give any definite information as to the probable date when a supply would be resumed from the power station. The company, however, would raise no objection to any consumer obtaining a supply of electricity from any source during the time its supply was not available, and no proceedings would be taken against any person or firm who might give a supply. Negotiations have been opened between representatives of the company and a local firm for the use of an engine and premises capable of generating sufficient electricity to supply all consumers. If a satisfactory arrangement can be arrived at, it is anticipated that the company will be in a position to give a supply to consumers within a week or ten days of the conclusion of the negotiations.

Newry (Co. Down).—The Urban District Council is applying to the Electricity Commissioners for Northern Ireland for a Special Order authorising it to supply electricity in the district. The estimated cost of the scheme is £25,000.

Preston.—Electrical Development.—The Town Council is applying for sanction to proceed with the provision of a fourth turbo-generator at the Ribble power station, at a cost of £140,000, thus bringing the total capital outlay on the undertaking to nearly £1,500,000. Electricity is already supplied to Leyland, through the Lancashire Electric Power Co., and next winter Blackpool will receive a supply. There has already been an inquiry respecting a supply for Southport.

Shrewsbury.—Transfer of Undertaking.—The Corporation has sealed an agreement for the transfer of its power station to the West-Midlands Joint Electricity Authority. The agreement provides that the actual completion of the purchase of the generating station will not take place until an adequate supply of electricity is available for the borough from the h.p. mains proposed to be laid down by the Joint Authority.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the following authorities:—The Whitchurch and Pangbourne Electric Supply Co., Ltd., to include in its area of electricity supply the parishes of Purley, Sulham and Tidmarsh; the Goring and Streatley Electric Light and Power Co., Ltd., to supply electricity in certain parishes in the rural districts of Goring, Crowmarsh, Bradfield, Wantage and Wallingford; the Chirk Electricity Supply Co., Ltd., to supply parts of the rural districts of Chirk and Oswestry.

The Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them authorising the Worcestershire and Staffordshire Electric Power Co. to supply electricity in the borough of Ludlow.

Swansea.—Supply for Docks.—The Electricity Committee is to lay a feeder cable, at a cost of £8,000, to give an additional supply of electricity to the docks of the Great Western Railway Co.

Loan.—Application is being made for sanction to a loan of £10,000 for meters.

Tiverton.—Loan.—The Town Council, on February 14th, approved a recommendation of the Lighting Committee that application be made for sanction to borrow £1,650 for an extension of the mains in order to make a complete ring and provide a safety line in case of a mishap to the main feeder.

Truro.—Electricity Supply.—The City Council has been informed by Messrs. Edmundsons Electricity Corporation, Ltd., that a supply of electricity will be available by next winter.

Tynemouth.—Loans.—The Electricity Committee is applying for sanction to loans of £16,000 for cable extensions, £2,000 for a sub-station at Cullercoats, £800 for extensions at Preston sub-station, £1,700 for a sub-station at Dock Road, £6,300 for sub-stations and equipment for supply to Commissioners' Dock, and £1,800 for two transformers.

Tramway and Railway Notes.

Bradford.—New Tramcar Design.—Trials have recently been made with a new type of long, single-deck tramcar, designed by Mr. R. H. Wilkinson, the city tramway manager, and built at the Thornbury depôt workshops. The car is 39 ft. long and capable of a speed of 20 to 30 m.p.h. The exits are in the centre of the car, and the interior furnishing is in polished mahogany, with seats upholstered in red leather. Power operated brakes and doors closed by electric control from the driver's platform form a special feature. The car has seating for 35 passengers.

Continental.—France.—New electric tramways have recently been completed and put into operation between Lille and Marquette (Nord) and between Marseilles and Les Olives (Bouches-du-Rhône).

Germany.—In connection with the work of electrification of the Berlin City railway, which is now in progress, it is announced that the Reich Railway Co. has placed orders for the delivery of aluminium coaches. The coaches will be constructed on behalf of the Metal Bank and Metallurgical Co., which is interested in aluminium rolling mills, in conjunction with wagon construction works.

Darlington.—Railless Cars.—The Rural District Council has granted an application from the Corporation to run railless cars from Park Lane along Geneva Road West subject to any additional cost for road repairs being borne by the Corporation.

India.—Railway Budget.—A *Reuter* message from New Delhi states that the Railway Budget for 1927-28, presented in both the Legislative Assembly and the Council of State on February 17th, provides for an expenditure during the year of 25 crores of rupees, of which 275 lakhs has been set aside for the electrification of the Great Indian Peninsula and Bombay, Baroda and Central railways.

London.—Underground Improvements.—Experiments are now being made at Earl's Court and South Kensington stations (District Railway) with a new type of train-starting device. Suspended from the roof at one end of each platform are a number of rods linked together with a cable. From this cable two wires are suspended, which connect electrically with a bell at the other end of the platform. When it is desired to start the train, the guard touches the two wires simultaneously with the metal handle of his flag. The circuit formed rings the bell which is near the motorman's cab. If these experiments are successful, the device will be introduced at all other stations between Acton and Bow.

Important structural alterations are now being made at Finsbury Park (Piccadilly line) station, to enable the traffic to be handled with greater ease and also to make the station itself more attractive. The present booking offices are to be cleared away and the passimeter system introduced. Several experiments have recently been made in floodlighting, particularly on the new Morden Tube, where the exteriors of the stations are floodlighted and the positions of the stations emphasised still further by means of searchlights placed on the station roofs. A further experiment of this kind is to be made at the reconstructed Finsbury Park station by substituting for the usual rows of subway lights a scheme of floodlights.

Swansea.—Mumbles Railway.—The *South Wales Daily Post* states that there is every possibility of an early move being made in connection with the electrification of the Swansea and Mumbles Railway. The Provisional Order has been obtained, and terms have been arranged with the Swansea Corporation for the supply of the necessary electricity. A conference on the matter with the chairman (Mr. Tegetmeier) and the engineer of the company has been arranged, when it is expected some definite steps will be taken.

Telegraph and Telephone Notes.

France.—Telephone Service.—Work has lately been commenced on the conversion of the Colbert telephone exchange in Marseilles to automatic operation.

It is announced that from February 17th Paris will be able to communicate by telephone with Venice, *via* Milan. A six minutes' conversation in the daytime will cost 60 fr., and an urgent call may be booked at triple rates.

Irish Free State.—Telephone Capital Bill.—In Dail Eireann on February 15th the Minister of Finance moved the second reading of the Telephone Capital Bill, under which it is proposed that £500,000 shall be advanced for the development of the telephone service in the Free State. Mr.

J. J. Walsh, Minister for Posts and Telegraphs, said that development fell under four distinct headings, namely :—

Erection of trunk lines	£26,900
New subscribers' connections and call offices	38,600
Underground cable work	111,180
Automatic telephones	123,000

He reminded the Dail that he was not asking for free utilisation of the taxpayers' money; every penny advanced would be paid back, principal and interest, within a period varying from fifteen to twenty years, and a considerable part of the amount asked for would be used for new buildings. In the year 1922-23 the loss was £46,000, in 1923-24 is was £25,000, and in 1924-25 the loss disappeared altogether. In 1925-26 they introduced substantial reductions in charges, and the loss rose to £35,000. He foresaw its total disappearance in 1927-28. They were installing two automatic exchanges in Dublin—one at Merrion and another in the Castle area; the latter would be opened about the middle of the year, and the other early next year. The Bill was read a second time, and the Committee stage was fixed for February 18th, says the *Irish Times*.

Portugal.—AFTERMATH OF REVOLUTION.—The country is returning to normal following the latest revolutionary movement. It is understood that the damage done to the Anglo-Portuguese Telephone Company's property in Lisbon will cost over 200 contos to repair; the company's loss in Oporto is estimated at 50 contos.—*Reuter* (Lisbon).

The rebel chief telephoned his momentous decision over the telephone system, which had continued working, for the telephone girls, like every one in the danger zone, were obliged to stay where they were when the firing broke out, says *The Times*, which announces that public subscriptions have been opened to reward the telephone girls. The British Ambassador has sent a letter of thanks to Mr. Pope, the manager of the telephone system, for the splendid services rendered. It was stated on February 11th that such messages as came through indicated that all the British staffs at Oporto and Lisbon were safe. The Eastern Telegraph Company's station at Carcavellos (at the northern mouth of the Tagus, near Lisbon) was working normally, and a message came through that the staff at the sub-station in Lisbon was safe.

Marconi's Wireless Telegraph Company stated that it was transmitting and receiving messages as usual between its English and Lisbon stations.

Transatlantic Telephony.—SERVICE EXTENSION.—In reply to a question in the House of Commons, the Postmaster-General, Sir W. Mitchell-Thomson, said that the number of telephone calls on the Anglo-American service from January 7th (the date of inauguration of the service) to the end of that month was 105 from Great Britain and 160 from America.

The service has been extended to other parts of this country outside London, whilst the facilities are being steadily extended in the United States, and now cover 36 of the 48 States in the Union. The area served comprises nearly half the territory of the Republic.

Radio Notes.

Denmark.—LICENCES.—It is stated officially that there are now 106,400 licensed Danish listeners: of that number, 54,743 are crystal users and the balance valve-set users.

Italy.—BROADCASTING CONTROL.—The Department of Overseas Trade learns from a reliable source that a Commission for the control of broadcasting services has been set up in Rome by Royal Decree. In addition to control, the Commission is charged with examining and reporting on the most suitable methods of developing and improving broadcasting from technical, artistic, and educative points of view.

Malaya.—NEW REGULATIONS.—The Malayan Wireless Committee recently submitted recommendations regarding radio regulation, which were accepted by the Government. An exclusive broadcasting licence is to be issued for a period of five years to the grantee, who will be chosen from the group of applicants after the expiration of three months from the date of first publication of the terms of the proposed licence. The broadcasting company must, within one year from the date of issue of the licence, install and operate one or more broadcasting stations with machinery of British manufacture of the latest type; renewals and replacements of operating plant need not be of British manufacture. The company must carry out a regular service, consisting of matter approved by the Postmaster-General. It will have the right to disseminate advertising matter and make charges therefor, but such broadcasting must not exceed more than 10 per cent. of the total daily broadcasting time. The Government will charge $20 annual fee for each receiving licence and pay the broadcasting company $18 of this sum.

Philippine Islands.—NEW RADIO LAW.—The Nieto Radio Bill has become a law. In the past broadcasting in the Philippines has been hampered because the stations had no financial support save that obtained from the sale of receiving apparatus, a portion of which accrued to the broadcasting concern. Under the Nieto law, an equitable situation is created whereby every owner of a set helps to support the programmes which he hears, regardless of whether the merchant from whom he purchased his receiver is carrying on broadcasting or not, says *Commerce Reports*. The installation of the former WJZ transmitter at the transmitting centre at Manila Heights is being expedited and should be heard with reliability throughout the archipelago. At the same time improved studio facilities and an adequate staff are being organised.

Suggested New Station.—NORTH WALES PROPOSITION.—At the Ryle Municipal Council's meeting last week, Mr. J. Jones Williams drew attention to the British Broadcasting Corporation's intention to set up a station in North Wales, and suggested Rhyl as the most suitable position for it. During the war, he said, there was a Government wireless station at Rhyl. The Council decided to ask the B.B.C. to locate its proposed North Wales station at Rhyl.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the ELECTRICAL REVIEW containing the advertisement is given in parentheses below.

Contracts Open.

Aberdeen.—March 4th. Parish Council. Re-wiring the electrical installation of Oldmill Hospital. Specifications from Mr. J. Alexander Bell, city electrical engineer.

Ashford.—March 14th. Electricity Department. Two electrically-driven centrifugal pumps (capacity 30,000 gal. per hour). (See this issue.)

Australia.—MELBOURNE.—April 5th. Postmaster-General's Department. Condensers. (B.X. 3215.)*

March 30th. Victorian Railways. Lightning arresters. (B.X. 3213.)*

April 26th. Telephone switches. (B.X. 3254.)* Instrument cords. (B.X. 3255.)*

BRISBANE.—April 13th. Brisbane City Electric Light Co., Ltd. Transformers. (B.X. 3218.)*

Bedford. — February 28th. Electricity Department. Twelve months' supplies of e.h.p. and l.p. cables and incandescent electric lamps. (February 11th.)

Belgium.—March 9th. Belgian Post and Telegraph authorities, La Salle Madeleine, Brussels. 40 kilometres of silk-covered enamelled wire, 25 kilometres of specially-insulated wire, and 4.6 kilometres of armoured wire cable.

Brecon.—March 16th. Electricity Department. Generating plant and switchgear, battery of accumulators and connections, underground and overhead lines. (See this issue.)

Bridlington. — March 9th. Electricity Department. Stores for 12 months, including lamps, electrical sundries, V.I.R. cables, &c. (See this issue.)

Cheadle and Gatley.—March 1st. Electricity Department. Annual contracts for lamps, meters, and wood covering boards. (February 18th.)

Colwyn Bay.—March 11th. Electricity Department. Twelve months' supply of cables, joint boxes, house service cut-outs, joint compound, sundry stores, house service meters. (See this issue.)

Dublin.—March 2nd. Great Northern Railway (Ireland). Stores for nine months, including electrical fittings, lamps, cable and wire. (February 18th.)

March 2nd. Office of Public Works. Installation of electric lighting at the Custom House, Dublin. Mr. T. Cassidy, secretary.

Dundee.—February 28th. Education Committee. Electrical installation for the new secondary school, Perth Road. Messrs. Thoms & Wilkie, architects, 21, South Tay Street, Dundee.

Durham (Co.).—March 12th. County Council. Electrical work for the Seaham Hall tuberculosis hospital. W. and T. R. Milburn, architects, 19, Fawcett Street, Sunderland.

Edinburgh.—Corporation. Supplies in connection with the maintenance of the Corporation properties, including supplies for the Lighting Department, &c. Form from Town Clerk.

Egypt.—Egyptian State Railways, Telegraphs and Telephones. Chief Inspecting Engineer, Queen's Anne's Chambers, Broadway, Westminster, S.W.1. Telegraph and telephone materials.

Ilford.—March 8th. Electricity Department. Twelve months' supply of house-service boxes, lamps, main cut-outs, meters, and pavement box covers. (See this issue.)

India.—March 22nd. India Store Department. Two 250-kW Diesel-engine alternator sets, with switchgear, transformer, &c. (February 18th.)

Leeds.—March 2nd. Tramways and Transport Committee. Materials, including electrical sundries required during year ended March 31st, 1928. General manager.

London.—Stepney.—March 3rd. Board of Guardians. Electrical fittings for 6 months. Mr. S. McClelland, clerk to the Guardians, Bancroft Road, Mile End, E.1.

Littlehampton.—March 8th. Sussex Electricity Supply Co., Ltd. One 150-kW Diesel engine and generator with auxiliaries, switchgear and cables. (February 18th.).

Oldham.—March 7th. Board of Guardians. Electric lamps and fittings. Mr. Fred. W. Fletcher, clerk.

Rhondda.—March 26th. Electricity Department. Twelve months' supply a.c. ordinary and prepayment meters, mains and house service material. (See this issue.)

Roxburgh.—March 5th. County Education Authority. Electrical work in connection with the reconstruction of and additions to High School, Hawick. Mr. J. A. Carfrae, architect, 3, Queen Street, Edinburgh.

South Africa.—Johannesburg.—March 3rd. South African Railways and Harbours. Overhead line material. (B.X. 3224.)*

March 19th. Municipal Council. Single-phase concentric cable. (B.X. 3236.)*

Cape Town.—March 9th. Electricity Department. Insulated wire. (B.X. 3233.)*

South Elmsall.—March 19th. Electric lighting installation at Westfield Lane Council School. Education Department, County Hall, Wakefield.

Stoke-on-Trent.—March 8th. Electricity Department. De-aerating plant and electrically-driven boiler-feed pumps. (February 18th.)

March 8th. Electricity Department. Twelve months' supply a.c. and d.c. meters, mains and cables. (See this issue.)

Torquay.—March 11th. Electricity Department. Two water-tube boilers with chain-grate stokers, induced draught plant, pipework and economisers. (February 18th.)

March 16th. Electricity Undertaking. One 6,000-kW turbo-alternator, with surface condenser and auxiliary plant. (See this issue.)

Warrington.—March 14th. Electricity Department. Motors and transformers. (See this issue.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Bangor.—Corporation.
Wiring 64 houses on the J. & P. wiring system.—Messrs. Owen & Palmer, Bangor.

Bradford.—Electricity Committee. Accepted:—
Water-softening plant at the Valley Road generating station.—Paterson Engineering Co., Ltd.

Chesterfield.—Electricity Committee. Accepted:—
E.h.p. metering switch cubicle.—British Thomson-Houston Co., Ltd.
One steam-driven boiler feed pump.—T. W. Ward, Ltd.
L.p. cables (£312).—Hogan & Wardrop, Ltd.
E.h.p. cables (£372).—Macintosh Cable Co., Ltd.

Clacton.—Urban District Council. Accepted:—
Two 1,125-b.h.p. oil engines (£20,500); two 750-kW alternators (£3,250).—English Electric Co., Ltd.
Rotary convertors and e.h.p. switchgear (£5,250).—Crompton & Co., Ltd.

Clydebank.—Town Council.
Housing scheme.—Supplying and fitting electric radiators (£3 6s. 11d. each).—D. Donald.

Croydon.—Electricity Committee. Recommended:—
Switchgear (£3,145).—Metropolitan-Vickers Electrical Co., Ltd.

Dublin.—Dublin United Tramways Co., Ltd.
Electric lamps, including 8,000 " Osram " vacuum tractior lamps.—General Electric Co., Ltd.

City Commissioners.
Wiring for electric lighting 59 four-roomed houses a Fairbrother's Field (£616).—Electricity Supply De partment.

Controller of Stores, Posts and Telegraphs.
Bell sets.—Siemens Bros. & Co., Ltd.
Coin boxes (telephone).—Hall Telephone & Accessories Ltd.
Insulators.—Doulton & Co., Ltd.
Telephone relays and coils.—Siemens Bros. & Co., Ltd.
Wireless parts.—Marconi's Wireless Telegraph Co., Ltd.
—*Irish Electrician.*

Durham.—Board of Guardians. Accepted:—
Electric lighting installation at the new Cottage Homes (£103).—Mr. R. Wilson.

Evesham.—Town Council. Accepted:—
Installing electric lighting at the baths.—Averill & Son

Glasgow.—Electricity Committee. Recommended:—
Sub-station switchgear (£239).—A. Reyrolle & Co., Ltd. also further sub-station switchgear during the year at the same price per set.
Two preheaters for two boilers at Dalmarnock power station (£5,800).—Howden-Ljungström Preheaters (Land), Ltd.

Libraries Committee.. Recommended:—
Alteration and repair of passenger hoist at Mitchell Library (£210).—Waygood-Otis, Ltd.

Tramways Committee. Accepted:—
Block tin.—P. W. MacLellan, Ltd.
Subway rails.—W. Beardmore & Co., Ltd.

Special Acts Committee. Accepted:—
Electric lighting installation at Eastwood Registration Office.—C. Maguire (Glasgow).

Government Contracts.—The following contracts were placed by various Government Departments during January, 1927:—

Admiralty, Contract and Purchase Department.
Alternators, motors and spares.—Mackie & Co.
Aluminium plating for cables.—British Aluminium Co., Ltd.; G. A. Harvey & Co. (London), Ltd.; Bulpitt and Sons, Ltd.
Aluminium sheets.—British Aluminium Co., Ltd.
Batteries.—Chloride Electrical Storage Co., Ltd.; D.P. Battery Co., Ltd.
Junction boxes.—L. Weekes (Luton), Ltd.; Hawkers, Ltd.
Electric cable.—Anchor Cable Co., Ltd.; General Electric Co., Ltd.; Enfield Cable Works, Ltd.; Siemens Bros. & Co., Ltd.
Mining cable.—Hooper's Telegraph & India Rubber Works Ltd.; Siemens Bros. & Co., Ltd.
Cells.—Premier Accumulator Co. (1921), Ltd.; London Battery & Cable Co., Ltd.
Electric fan spares.—General Electric Co., Ltd.
Fuse holders.—Pinnacle Switchgear, Ltd.
Motor-generator set.—British Thomson-Houston Co., Ltd.
Motor generators.—Newton Bros. (Derby), Ltd.; Laurence Scott & Co., Ltd.
Heterodyne and stabiliser units.—Radio Instruments, Ltd.
Electric light and bell installation and installation of electric light and power.—G. E. Taylor & Co.
Electric lamps.—General Electric Co., Ltd.
3,000-kW turbo-alternator.—C. A. Parsons & Co., Ltd.
W./t. valves.—Mullard Radio Valve Co., Ltd.

War Office.
Aluminium ingot.—British Aluminium Co., Ltd.
Electric cables.—Standard Telephones & Cables, Ltd.
Portable secondary cells.—Tudor Accumulator Co., Ltd.
5-kW frequency changer.—Newton Bros. (Derby), Ltd.
Electric locomotive.—Electromobile, Ltd.
X-ray sets.—" Solus " Electrical Co.
Installation of electric cable system, Smallshot.—Standard Telephones & Cables, Ltd.
Installation of electrical services, officers' quarters, &c.—A. V. Gifkins & Co., Ltd.

Air Ministry.
Wireless towers (various stations).—Milliken Bros., Ltd.
Alternator set (Croydon).—Aster Engineering Co. (1913), Ltd.
Control resistance and voltmeters.—British Radio Corporation, Ltd.

Post Office.
Telephone apparatus.—Automatic Telephone Mfg. Co., Ltd.; Ericsson Telephones, Ltd.; International Electric Co., Ltd.; Peel-Conner Telephone Works; Phœnix Telephone & Electric Works, Ltd.; Siemens Bros. & Co., Ltd.; Standard Telephones & Cables, Ltd.

Wireless apparatus.—General Electric Co., Ltd.; Marconi's Wireless Telegraph Co., Ltd.
Telephone cabinets.—Siemens Bros. & Co., Ltd.
Cable (various).—British Insulated Cables, Ltd.; Callender's Cable & Construction Co., Ltd.; Connolly's (Blackley), Ltd.; W. Geipel, Ltd.; W. T. Glover and Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Pirelli-General Cable Works, Ltd.; Standard Telephones & Cables, Ltd.; Union Cable Co., Ltd.
Loading coils.—General Electric Co., Ltd.
Cords for telephones.—London Electric Wire Co. & Smiths, Ltd.; Phœnix Telephone & Electric Works, Ltd.; Standard Telephones & Cables, Ltd.
Ducts.—J. Place & Sons, Ltd.; Standard Brick & Terra Cotta Co., Ltd.
Electric hand lamps.—Ward & Goldstone, Ltd.
Telegraphic ironwork.—J. H. Allen; Bert, Birks & Co.; Bullers, Ltd.; T. W. Lench, Ltd.; C. Richards and Sons, Ltd.
Cadmium copper wire.—R. Johnson & Nephew, Ltd.
Manufacture, supply, drawing-in and jointing cable.—Godalming-Haslemere: Johnson & Phillips, Ltd. Hull - Grimsby, G.P.O.(S) - Wallington Junction: Standard Telephones & Cables, Ltd. Bristol-Temple Cloud: Pirelli-General Cable Works, Ltd. London—Amersham (London-Chorley Wood section): W. T. Henley's Telegraph Works Co., Ltd.
Manufacture, supply and laying submarine cable.—Portsmouth-Gosport: Pirelli-General Cable Works, Ltd.
Telephone exchange equipment.—Wandsworth, Wimbledon and Epsom Gas Co., Ltd.; Royal Arsenal Co-operative Society, Ltd., (S.E.18); Spillers & Bakers, Ltd. (Cardiff); John Player & Sons (Nottingham); Dorset County Council (Dorchester): Relay Automatic Telephone Co., Ltd. Middlesbrough (Middlesbrough multi-office area), Stockton-on-Tees: General Electric Co., Ltd. Sub-contractors: Chloride Electrical Storage Co., Ltd., for batteries; Crompton and Co., Ltd., for machine plant. Linthorpe (Middlesbrough multi-office area) and Southbank (ditto): General Electric Co., Ltd. Sub-contractors: W. Jones and Co. for ringing machines. Horley (Surrey): General Electric Co., Ltd. Sherwood (Nottingham), Arkwright Street (ditto), and Malvern: Automatic Telephone Mfg. Co., Ltd. Walsall (Walsall multi-exchange area): Ericsson Telephones, Ltd. Sub-contractors: D.P. Battery Co., Ltd., for batteries; Crompton & Co., Ltd., for machine plant. Bloxwich (Walsall multi-exchange area): Ericsson Telephones, Ltd. Sub-contractors: Automatic Telephone Mfg. Co., Ltd., for ringing machine. Bath (Bath multi-office area): Ericsson Telephones, Ltd. Sub-contractors: D.P. Battery Co., Ltd., for batteries; Crompton & Co., Ltd., and General Electric Co., Ltd., for machine plant. Batheaston (ditto): Ericsson Telephones, Ltd. Sub-contractors: Automatic Telephone Mfg. Co., Ltd., for ringing machines. Bermondsey: Standard Telephones & Cables, Ltd. Sub-contractors: Electric Construction Co., Ltd., for charging machines; Crompton & Co., Ltd., for ringing machines; and D.P. Battery Co., Ltd., for batteries.
Telephone repeater station power plant.—Marks Tey: Newton Bros. (Derby), Ltd. Sub-contractors: Pritchett & Gold & E.P.S. Co., Ltd., for batteries; Ruston and Hornsby, Ltd., for engines.
2-wire repeater equipment for Canterbury telephone repeater station.—General Electric Co., Ltd.

CROWN AGENTS FOR THE COLONIES.

Cables.—W. T. Henley's Telegraph Works Co., Ltd.; Johnson & Phillips, Ltd.; Siemens Bros. & Co., Ltd.
Fuse mountings.—Telephone Mfg. Co., Ltd.
"Lux" cells.—Chloride Electrical Storage Co., Ltd.
Telephone apparatus.—Ericsson Telephones, Ltd.; Bullers, Ltd.; Peel-Conner Telephone Works.
Train-lighting spares.—Pritchett & Gold & E.P.S. Co., Ltd.; J. Stone & Co., Ltd.
Wire.—F. Smith & Co., Ltd.
X-ray equipment.—Watson & Sons, Ltd.

H.M. OFFICE OF WORKS.

Wiring Adastral House, Kingsway, W.C.—J. G. Briggs and Co.

Hornsey.—CORRECTION.—The names of the contractors for the electric lighting installation at the Council houses, recorded on page 181 of the February 4th issue are Messrs. E. Wight & Co., of Muswell Hill and Finchley (not Wright and Co.).

Liverpool.—Pacific Steam Navigation Co., Ltd.
Twelve months' supply of "Mazda" electric lamps.—British Thomson-Houston Co., Ltd.

London.—LONDON, MIDLAND & SCOTTISH RAILWAY CO.
"Cosmos" vacuum train-lighting lamps.—Metro-Vick Supplies, Ltd.

ADMIRALTY.
Spring contact pieces, rotary switches, and guards for handlamps.—Edison Swan Electric Co., Ltd.

LONDON COUNTY COUNCIL.—Wiring of three blocks of dwellings on the Hornsey Rise estate for electric light:—

A. Shaw	£1,267†
R. Hunt & Co., Ltd. (Accepted.)	**1,375**
Austin & Groves	1,573†
Alpha Mfg. & Electrical Co., Ltd.	1,619
Alex. Hawkins & Sons	1,739
A. Higginbotham & Sons	1,772
C. Mortlock	1,885
D. W. Whymant	1,887
Anderson, Angell & Co.	1,954
Eastern Armature Winding Co.	2,025
Bailey & Incledon, Ltd.	2,159
Smethurst & Co. (London), Ltd.	2,463
Holder & Snider	2,568
E. Wight & Co.	2,816
General Electric Maintenance Co.	3,860

† Tender does not include provision money (£160).

STEPNEY.—Electricity Supply Committee.
3 tons sheet lead (£111).—Locke, Lancaster & Johnson and Sons, Ltd. (Accepted.)
Maximum demand indicators (£7,358).—Reason Mfg. Co., Ltd. (Recommended.)

HACKNEY.—Baths Committee.
Extension of filtration plant at the Central Public Baths, complete with electric motors, switchgear, &c. (£3,745).—Bell Bros. (Manchester), Ltd. (Recommended.)

SOUTHERN RAILWAY. Accepted:—
Six months' supply of electric lamps.—British Thomson-Houston Co., Ltd.; Siemens & English Electric Lamp Co., Ltd.

ISLINGTON.—Lighting Committee. Recommended:—
Steam mechanical soot blowers (£2,650).—Babcock & Wilcox, Ltd.

Works Committee. Recommended:—
Battery for electric vehicle (£182).—Chloride Electrical Storage Co., Ltd.

WESTMINSTER.—Highways Committee. Recommended:—
Dustproof-type electric motor for salvage plant (£96).—Elliston, Evans & Jackson, Ltd.

Macclesfield.—Rural Council. Accepted:—
Installing an electric generating set in connection with the Gawsworth housing scheme (£736).—W. R. Brown.

Newcastle.—Tramways Committee. Accepted:—
200 tons of tram rails and 8 tons of fish plates (£2,191).—Cargo Fleet Iron Co., Ltd.

Rotherham.—Rural Council. Accepted:—
Installing electric lighting in 51 houses at Brampton Bierlow (£260).—Wombwell Electrical Contracting Co.

Southend-on-Sea.—Town Council. Accepted:—
11,000-V, h.p. mains, pilot and control cable for the linking-up of the Leigh, London Road, and Thorpe Bay stations (£28,479).—Pirelli-General Cable Works, Ltd.

Forthcoming Events.

British Industries Fair.—February 21st to March 4th. White City, London, W., and Castle Bromwich Aerodrome, Birmingham.

Institution of Engineering Inspection.—Friday, February 25th. Royal Society of Arts. 7.30 p.m. "The Economic Production of Steam by Electricity." Mr. C. J. Wharton.

Birmingham Electric Club.—Friday, February 25th. Grand Hotel. 7 p.m. "Wireless Telephony." Mr. C. G. A. McDonald.

Institution of Mechanical Engineers.—Friday, February 25th. London. 7 p.m. "Waste Heat Recovery." Major W. Gregson.

Physical Society.—Friday, February 25th. Imperial College of Science, South Kensington, S.W. 5 p.m. Guthrie Lecture, "Atomic Nuclei and their Transformations." Sir Ernest Rutherford, F.R.S.

National Association of Supervising Electricians.—Saturday, February 26th. Holborn Restaurant. 6.30 p.m. Annual dinner.
Tuesday, March 1st. Junior Institution of Engineers. 7.15 p.m. "Electric Lighting and Electrically-worked Apparatus on Railways." Mr. R. T. Smith.

Royal Society of Arts.—Monday, February 28th. "Photo-Elastic Measurements of Stress Distribution." Prof. E. G. Coker, F.R.S.

Electrical Society of Glasgow.—Tuesday, March 1st. 30, Gordon Street. 7.30 p.m. "Reminiscences." Messrs. C. W. Fraser, D. Denholm, W. Bennett, and P. J. Sims.

Röntgen Society.—Tuesday, March 1st. 32, Welbeck Street, W. 8.15 p.m. Ordinary scientific meeting.

Electrical Power Engineers' Association (Midland Division).—Tuesday, March 1st. Chamber of Commerce, Birmingham. 7 p.m. "Super-Tension Cables." Mr. C. Vernier.

(Southern Division).—Friday, March 4th. Institution of Electrical Engineers, London. 7 p.m. "The Installation and Maintenance of e.h.p. Cable." Mr. E. Bowden.

Institution of Heating and Ventilating Engineers.—Wednesday, March 2nd. Caxton Hall, S.W. 7 p.m. Discussion on Dr. Margaret Fishenden's paper, "The Effect of Weather Conditions upon the Heat Requirements of a House."

Edinburgh Electrical Society.—Thursday, March 3rd. Royal Scottish Society of Art. 8 p.m. "Electro-Medical Equipment." Mr. W. Rennie.

Institution of Electrical Engineers.—Thursday, March 3rd. London. 6 p.m. "Illuminating Engineering." Mr. J. W. T. Walsh; and "Problems of Public Lighting by Electricity." Mr. H. T. Harrison.

(North-Eastern Centre).—Monday, February 28th. Armstrong College, Newcastle-on-Tyne. 7 p.m. "Some Recent Advances in a.c. Measuring Instruments." Lt.-Col. K. Edgcumbe and Mr. F. E. J. Ockenden.

(Irish Centre (Dublin)).—Tuesday, March 1st. Mansion House, Dublin. 7.45 p.m. Faraday Lecture, "What is Electricity?" Prof. W. M. Thornton.

(Tees-Side Sub-Centre).—Monday, February 28th. Middlesbrough. 7 p.m. "The Design of City Distribution Systems." Messrs. J. R. Beard and T. G. N. Haldane.

(East-Midland Sub-Centre).—Tuesday, March 1st. University College, Nottingham. 6.45 p.m. "The Design of City Distribution Systems." Messrs. J. R. Beard and T. G. N. Haldane.

(Wireless Section).—Wednesday, March 2nd. London. 6 p.m. "Short-Wave Wireless Telegraphy." Mr. T. L. Eckersley.

(South-Midland Students' Section).—Tuesday, March 1st. 7 p.m. Ordinary meeting.

(North-Western Students' Section). — Saturday, March 5th. Manchester Municipal College of Technology. 7 p.m. Dance.

Junior Institution of Engineers.—Friday, March 4th. 39, Victoria Street, S.W. 7.30 p.m. Informal meeting. "An Evening with the Old Brigade."
Saturday, March 5th. Suffolk Street Galleries. 6.30 p.m. Annual dance.

Notes.

Glasgow Corporation Tramway Supply Account.

A joint meeting of sub-committees of the Glasgow Electricity and Tramways Committees was held recently to consider the price of electricity supplied during the coal dispute. It was recommended that the claim of £1,146 for the extra cost of coal for electricity supplied during June and July be reduced to one-half, and that the account for the other months, amounting to £7,596, be paid in full. The account to be paid by the Tramways Department to the Electricity Department will accordingly be £8,169.

Train Accident Report.

We have received a copy of the official report of the inquiry into the circumstances of an accident which occurred on October 12th last between Charing Cross and Waterloo Junction, on the Southern Railway, when a passenger train from Charing Cross was partially derailed at the facing points of the through crossing from the down through line to the down local lines. The section of the line had recently been equipped throughout with modern all-electric apparatus by the Westinghouse Brake & Saxby Signal Co. The accident was curious in that it was the outcome of the combination of a failure in the locking of the points and a signalman's error in pulling a control lever too soon, resulting in the derailment of the train.

American Drawn Tungsten Patent Held Invalid.

It will be remembered that in 1925 the House of Lords held in the case the British Thomson-Houston Co., Ltd., *v.* British Insulated & Helsby Cables, Ltd., that the British patent owned by the plaintiffs relating to improvements in the treatment of tungsten to facilitate working was invalid. The Lords of Appeal decided that the production of tungsten which was ductile when cold was more the result of advances in the metal-worker's art than of any discovery. The judgment was given in full in our issue of February 13th, 1925 (p. 279).

The parallel United States patent was recently invalidated by a decision of the United States District Court for Delaware. According to an *Electrical World* report, the General Electric Co. (of America) brought an action against the De Forest Radio Co. charging it with contributory infringement of its patent for improvements in tungsten and methods of making tungsten for lamps and other purposes. The plaintiffs also brought suits against the De Forest Co. and the Robelin Piano Co. for infringement of certain product claims of the patent. The acts charged were the manufacture and sale of radio valves having ductile tungsten filaments made by an alleged infringing manufacture of drawn tungsten wire and the re-sale of the valves by the Robelin Piano Co. The defendants contended that the claims made were invalid. The product claims were attacked for want of patentable subject matter, in that they called for a product of nature, that the raw material to which the process was applied and the product resulting from that process were alike, the element tungsten, and that the properties of the product, like those of the original body, were discovered natural, not invented artificial properties. The plaintiffs did not deny that a wire or rod of a prior patent was a coherent mass of tungsten and as such the starting body called for by their patent, but averred that until Dr. W. D. Coolidge, the inventor named in the patent, did his work and accomplished his results it was not known that the prior rod constituted a suitable starting body. The claims in the suit called for tungsten that was pliable or ductile at room temperature, and one problem involved in the trial was to determine whether ductility was a natural or an artificial property of tungsten, whether tungsten ductile cold was a "manufacture" or a product of nature, and whether a single element of nature not patentable before mechanical treatment might be made patentable by subjecting it to mechanical treatment. The Court held that invention involved not only mental conception but manual application, and the discovery of the cold ductility of tungsten was not patentable.

The Batti-Wallahs' Society.

The Batti-Wallahs' annual dinner is to take place at the Hotel Cecil on Tuesday, March 22nd, at 7 p.m., and will be followed by dancing till midnight; it is intended to make this the occasion for celebrating the 21st birthday of the Society. Ladies and gentlemen friends of members will be welcome, and tickets may be obtained from the members of the Council or from the hon. secretary, Mr. M. Whitgift, 7, Coulter Road, Hammersmith, W.6.

On Wednesday last week, at the Hotel Cecil, with the president, Mr. A. W. Blake, in the chair, the Society entertained at luncheon Sir Duncan Watson. After the loyal toast had been honoured, Sir Duncan addressed the members, concisely reviewing the past, present, and future of the electricity supply industry. Referring to the chaotic state of things that obtained 25 years ago, he expressed the views that the incursion of the municipalities into electricity supply had been of immense value, and that full co-operation between private and public enterprise was most important. By reducing the cost of electricity, he said, the Government scheme would increase the demand; the Act was not perfect, but could be amended, and in the meantime it should be given a fair trial. In his view they were on the threshold of the greatest electrical development this country had ever known.

Lecture.

Mr. F. Farrar, A.M.I.E.E., gave a lecture with demonstrations at a meeting of the Walsall Engineering Society last week, on "Some Applications of Electricity." At the conclusion of the lecture the president of the Society, Mr. W. J. Talbot, said that the Talbot-Stead Tube Works, with which he was associated, now employed about 150 electric motors, and their experience had been that electricity was the cheapest medium for power in the long run. They had found that the total cost of energy was only 2 per cent. of the whole. He warned manufacturers, however, not to think that electricity was going to revolutionise everything, or compensate for inefficiency in other directions.

Spinning Electrons and Protons.

Writing to *Nature* of February 12th, Mr. H. S. Allen says: "The remarkable results obtained within the past 15 months by employing the spinning electron in Bohr's atomic model suggest the question whether it may not be necessary to suppose that the proton also is capable of a quantised spin. Although the analytical difficulties in applying the new quantum mechanics to this problem may be considerable, they may not be too great to be overcome by mathematicians. There seem to be several arguments in favour of such a hypothesis. If, as is generally assumed, the proton is the positive electron, it seems natural to suppose that if the negative electron can spin with unit angular momentum the positive electron may do the same. Again, it may be easier to understand the structure of a complex nucleus if the units of which it is composed can act as elementary magnets. Prof. Duane has attempted to explain corpuscular emission from a radioactive nucleus on these lines. Finally, recent experiments on the deflection of protons and alpha particles in collision with an atomic nucleus seem to lend support to the idea of a magnetic field in the vicinity of a nucleus. A spinning electron is one example of a *magneton*. My main object in this letter is to remind readers of *Nature* that a quantised magneton was first described in these columns by Prof. S. B. McLaren, a victim of the war."

E.P.E.A. Dinner.

The third annual dinner of the North-West Midland Section of the Electrical Power Engineers' Association was held at the "Star and Garter" Hotel, Wolverhampton, on February 15th. The chairman was Mr. D. J. Duffy, Wolverhampton, and many distinguished persons were present.

Viscount Ednam, in proposing "The E.P.E.A.," said the Association protected not only its members, but the public also. If other trade unions had behaved in the same way as the E.P.E.A., there would have been no need for the squabble on the subject in the House of Commons. He said that no better principle could be embodied in the rules of any association than that of negotiation under the Whitley system. During a recent visit to America he was impressed by the fact that in Milwaukee they distributed more electricity than in the whole of the City of London. He wanted enough cheap power to run his steelworks and collieries, but he found it was cheaper to generate his own supply. During the general strike he saw some fuel being put into boats from a certain mound, and on inquiry found that the pit had ceased working in 1785; the slack went to a power station, where it was burnt all right. Referring to the Government scheme, he said that if Colonel Moore Brabazon had faith in it, then it must be a good one.

Mr. J. N. Waite, vice-president, in reply, said that for the Association and its members to be prosperous, it was first of all necessary for the industry itself to be in a thriving and prosperous state, as one could not take from an industry that which was not there. He reminded Lord Ednam that the most efficient turbo-generators in the U.S.A. had been made in this country.

Colonel J. F. Lister, C.M.G., proposed "The West Midlands Joint Electricity Authority." He related some of his experiences in a power station in the early days, and referred to the development which was to take place by the interlinking of certain stations. He referred also to the backwardness of this country in the distribution of electricity in rural areas, citing instances on the Continent and in Egypt, where he had come across the most uneducated type of workman operating motors and other gear. He made a plea to all connected with the authorities now being set up in this country to do their best to see that the poles for carrying the h.p. cables in the rural areas would not only be serviceable, but as artistic and pleasing as possible compatible with reasonable cost.

Mr. S. T. Allen, chief engineer and manager of the West Midlands Joint Electricity Authority, replied, and gave a *résumé* of the spadework which had been done in the Midlands during the last six months. He impressed on the members of the Association the great responsibility which was not only on his shoulders, but would be in the very near future on the shoulders of most of the technical staffs represented at the dinner, when the individual stations in the district were taken over by his authority. The total expenditure on the schemes would reach £3,500,000.

Mr. T. A. G. Margary very ably proposed the toast of "The Visitors," to which Mr. G. R. J. Parkinson, vice-chairman of the West Midlands Joint Electricity Authority, responded in a brief but humorous and well-balanced speech.

Electric Locomotives in Switzerland.

The Oerlikon Company is at present building for the Swiss Federal Railways 18 heavy goods locomotives, which differ from those formerly supplied in that they are designed for a larger output. In order to determine the heating of the motor equipments and ascertain their output, one of the motors was provided with thermo-couples and subjected to a series of load tests, the thermo-couples being arranged as near as possible to the conductors of the stator and rotor windings. The results of the tests are given in the following table:—

	Continuous rating			One-hour rating		
	Amps.	kW.	r.p.m.	Amps.	kW.	r.p.m
Data for calculation of motor ...	1,400	435	620	1,600	485	555
Performance on test:						
(*A*) with temperature rise according to the regulations of the Swiss Federal Railways.	1,550	480	560	1,730	530	530
(*B*) with temperature rise according to the American Rules.	1,780	545	520	2,070	610	480

The pressure of all the tests was 360 volts: the tests showed that the motors would even be large enough for the express locomotives recently standardised by the Swiss Federal Railways, as the temperature rise would then be still just within the permissible limit. The speeds of the goods engines at the one-hour and continuous ratings (41 and 40.5 m.p.h., respectively) actually correspond to those provided for in the case of the express locomotives. The highest normal motor speed of 1,030 r.p.m. is, however, only attained at 74.5 m.p.h. by the express locomotive, while it is reached at 40.5 m.p.h. by the goods engines.

Meter Engineers' Technical Association.

The sixth general meeting of this Association was held at the E.L.M.A. Lighting Service Bureau, London, on February 17th, when the chair was taken by Mr. C. H. W. Gerhardi, and a paper was read by Mr. C. W. Pike on "Meter Testing Methods and their Relationship to Output and Accuracy." The discussion was opened by Mr. H. R. Burroughs, who feared that many meter engineers were unable to carry out tests to a great degree of precision. In referring to the sustained accuracy of meters in service, he instanced the case of a large meter recently installed agreeing to within 2 per cent. with the sum of 9 sub-meters which had been on circuit for 20 years.

Mr. S. Hunt did not agree with the suggestion for using a sub-standard meter with a range of shunts; nor with the total abolition of an observer, especially in the case of large meters. His department had no difficulty in testing from 200 to 250 meters per week, the large majority of which he was able to certify as "O.K." Regarding the question of hysteresis, although it had caused considerable inaccuracies in old type meters, he had found no trouble due to this cause in those of recent manufacture.

Mr. W. Casson did not agree that meter engineers should not endeavour to obtain as high a degree of accuracy with integrating sub-standards as with indicating instruments. He suggested that the remedy for inaccuracies due to wave form was to use meters which one knew by experience to be unaffected. He contended that no commutator meter should be used in this country as a sub-standard, as, owing to climatic conditions, its friction would be too uncertain.

Mr. C. B. Green was of the opinion that the "personal error" was practically eliminated when the tester had confidence in himself, and cited the work of the N.P.L. as an example of accuracy obtainable with the use of the stop-watch and potentiometer method of testing.

Mr. R. P. Bossom described the method of testing electrolytic meters by copper voltameters, and stated that these agreed to within ¼ per cent. with the results obtained by potentiometer.

Royal and Whitworth Scholarships.

The Board of Education has recently issued the syllabus for the examination to be held in April and May, 1928, for Royal scholarships and free studentships in science, tenable at the Imperial College of Science and Technology, London, and also the regulations for the award of Whitworth scholarships for mechanical science in 1928. These and full details of the scholarships are obtainable from H.M. stationery office.

Leader Cable for Aircraft.

Fog flying experiments with the leader cable system, as stated in *The Times*, are now in progress at the Royal Aircraft Establishment, Farnborough, and the scheme is now being tried on a large scale in the Woking-Basingstoke area with five miles of cable laid in the form of an oval within the aerodrome. Two sides of the oval are nearly straight, and along one of them is an auxiliary cable giving a signal of a different frequency. This indicates the area around which a landing can be made with the greatest ease. The aircraft is fitted with two search coils in the wings connected with an instrument in the cockpit, which tells the pilot, by means of oscillating lights on vertical scales, whether he is to port or starboard of the cable. The newer instruments have enabled the amperage to be reduced to 50, the horsepower to 3 per mile, and they are sensitive to signals from a height of 1,500 ft. downwards; they are, in fact, so delicate that they respond to a signal of 0.0005 microwatt.

Television.

Dr. E. F. W. Alexanderson, consulting engineer of the General Electric Co. of America and the Radio Corporation of America, who has devoted a great deal of time to telephotography and television, declares that "our work has already proved that the expectation of television is not unreasonable, and it may be accomplished with means that are in our possession at the present day. How long it will take us to attain practical television I do not venture to say." The radio transmission of a single photograph has been accomplished, but television will require the transmission, reception, and reproduction of a single picture in one-sixteenth of a second, and one of the fundamental difficulties is the development of a projector which will enable one to see on a screen the movement of objects miles away. "It is easy enough to design a television system with something like 40,000 picture units per second," states Dr. Alexanderson, "but the images so obtained are so crude that they have no practical value; an operating speed of 300,000 picture units per second will be needed to give pleasing results." The method devised to speed up the process is the use of seven distinct light sources, converging in a cluster which scans the picture, all seven interlacing optically to produce a single good picture. The model projector used by Dr. Alexanderson consists of seven light sources converged by an optical system on to a revolving drum carrying 24 mirrors, which reflect the light cluster on to a screen. The useful illumination is thus increased 49 times, and the speed at which each light beam must travel has been reduced at the rate of 7 to 1; in addition to these advantages each beam needs to move only one-seventh as fast, and therefore needs to give only 43,000 instead of 300,000 independent impressions per second. A modulation speed of 43,000 per second is high in present radio practice, but is within reason, being only 10 times as fast as that used in broadcasting. For the independent control of the seven light spots seven photo-electric cells are located in a cluster at the transmitting machine and control a multiplex radio system with seven channels. A Hammond multiplex system may

be used with seven intermediate carrier waves which are "scrambled" and sent out by a single transmitter, and then "unscrambled" at the receiving station so that each controls one of the seven light beams. Dr. Alexanderson has radio-transmitted pictures by means of both modulated and interrupted signals: with the former system, any broadcasting station can transmit photographs for distances as great as music of good quality can be transmitted by that station; for long-distance transmission the short-wave telegraph system may be used. Reception of pictures by telegraphy is independent of signal strength; thus, if the signal is strong enough to be recorded at all, it gives the same kind of records at maximum as at minimum signal intensity, which makes recording independent of fading. If, furthermore, the signals are stronger than the prevailing static, it is possible to eliminate static effects by introducing a "threshold" value of signal strength in the receiver so that nothing is received unless the signal exceeds this value.

National Union of Scientific Workers.

This union, which was founded in 1918 to promote the cause of science in our national life and to improve the status of the scientific worker, has not succeeded in becoming a fully representative organisation, its membership being a little below 1,000, although there must be some 10,000 persons eligible for membership. An appeal has therefore been issued this week to all qualified scientific workers in this country, inviting an expression of their views on the possibility and desirability of building up a body fully representative of their broader interests. It is signed by a large number of brilliant lights of the scientific and industrial world—including Sir W. H. Bragg, Dr. W. H. Eccles, Sir Richard Gregory, Sir Robert Hadfield, Sir Hugo Hirst, Sir Thomas Holland, Sir Max Muspratt, Sir Charles Parsons, Prof. J. S. Huxley (president), Prof. H. L. Callendar, Dr. Norman R. Campbell, Dr. Ezer Griffiths, Prof. C. F. Jenkin, Prof. E. W. Marchant, Mr. C. C. Paterson, and over 100 other eminent supporters, covering the whole field of science and technology.

The Union is entirely non-political, and has been successful in bringing about improvements in the conditions of service of groups of scientific workers in Government and private employ; if it could speak for a united profession its activities could be extended and its influence could be exercised effectively in the interests of research, training, and other national services, without trespassing on the sphere of any existing organisation. In view of a misconception that exists in some quarters, it is pointed out that the strike is not a possible weapon for scientific workers, and the Union has never imagined the possibility of its employment.

The present rate of subscription is 30s. per annum, but if the membership were considerably increased it should be possible to reduce the subscription to about 10s. The present appeal is not for membership, but for the views of those interested, for the guidance of the Council; readers can obtain particulars from the Secretary, 25, Victoria Street, S.W.1.

Appointments Vacant.

Charge engineer for the Singapore, Straits Settlements, Municipal Electricity Department. Distribution engineer (£456) for the Torquay electricity undertaking. Chief engineer and general manager for the Altrincham Electric Supply, Ltd. Chief clerk (£217) for the Borough of Colne Electricity and Tramway Department. Foreman winder for fans and small motors, for the Rangoon Electric Tramway and Supply Co., Ltd. (See our advertisement pages to-day.)

Mansfield Electricity Investigation.

The concluding stage of the investigations into the affairs of the Mansfield Corporation electricity undertaking, consequent upon the appointment of a special committee of investigation twelve months ago, following certain statements that were made in the Council Chamber, was reached recently when a special meeting of the Council was held to receive the report and findings of the committee.

The statements made with reference to the management of the Electricity Department were to the effect that lengths of cable attached to drums and representing a considerable outlay in money were lying in different parts of the town; that many yards of cable had been laid at great cost, and in some cases were still dead, and in others supplied very few consumers; that mistakes had been made by the engineer in fixing the position in which the cable had been laid, thereby involving extra and unnecessary expense in the connecting up of consumers; that the engineer had not exercised reasonable care in erecting a disconnecting box on the Intake Estate, and that in consequence avoidable expense had been incurred; that the voltage on the Woodhouse section was below that required by the Board of Trade, and the generating plant had been taxed beyond its capacity in an attempt to boost up the pressure; that the cost of electricity in Mansfield compared unfavourably with that obtaining in other towns of a similar size; that for excavation work for cable laying the Corporation had been paying an excessive price; that the establishment of an electricity showroom was bad policy, involving a large expenditure upon which an adequate return was unlikely; that the management of the concern needed investigation, and that the ratepayers were entitled to an explanation of how it had come about that the Corporation was ceasing to generate electricity and taking a bulk supply from the Derby and Notts Power Company.

The conclusions drawn by the Committee were, briefly, that it was satisfied that the undertaking was in a perfectly sound financial position. While it had diffidence in expressing an opinion as to the technical side of the undertaking, the Committee felt that Mansfield was to be congratulated on the fact that during the whole of the time the undertaking had been in existence there had been very few interruptions in the supply to the public. The inference, therefore, was drawn that the plant and cable was of good quality, and that the technical work in the department had been carried out satisfactorily. Further, the figures for generating costs in comparison with the published returns of other stations indicated that the Mansfield electricity works had on the generating side been economically managed. In this connection, having regard to the fact that the Corporation would soon cease to generate, and become in the main a distributing agency, the Committee felt it incumbent to take into consideration how far it might be advisable to review the staffing of the concern with the object of eliminating unnecessary expenditure. The Committee was satisfied that there was not the slightest cause to doubt the personal honour and integrity of the chairman and members of the Electricity Committee, or of the engineer and his staff. Much information had been required by the Committee, which had thrown additional work on the electrical engineer's staff, particularly the chief clerk, and it was recommended that he should be granted an honorarium of £10.

The Mayor of Mansfield, in moving the adoption of the report, said: "Our investigations have covered a period of ten years. We are satisfied, and confirmed in the view we held before the inquiry began, that there is not the slightest cause nor ground for questioning the personal honour and integrity of the present chairman, nor of any of his predecessors, nor of the members of the Electricity Committee during that or any other period, nor of the engineer or his staff. It is well to remember that all the decisions, all the acts of the Committee, are those of the Council, for the Council has confirmed the decisions and recommendations of the Committee." The motion was carried, only one member voting against it.

Accumulator Makers' Association.

The annual dinner of the Accumulator Makers' Association was held at the Savoy Hotel, London, on February 21st, when Mr. B. M. Drake presided over a large company. Our report of the speeches is unavoidably held over until next week.

The French Electrification Programme.

According to Mr. Raymond de Nys, in *Foreign Trade*, France, after the war, began the execution of a vast programme of exploitation of her immense hydraulic resources, and increased the consumption of electricity from 7,738 million kWh in 1923 to 10,000 million kWh in 1925. It was hoped that the electrification of the country districts would proceed rapidly and that several important railway systems would be able to substitute electric for steam traction. The P.L.M. completed promised work on the Culoz-Modane line, the Midi system equipped the Bordeaux-Bayonne line and introduced electric traction on its Toulouse-Pau line, and the Orléans electrified its Paris-Orléans section; but this was all, except a few short-distance lines in the suburbs of Paris.

The hydro-electric plant of Eguzon, in the Department of the Indre, was put in operation recently, and now furnishes energy to the Paris region. The new station of Mativie, on the Cère, tributary of the Dordogne, is expected to begin operations in a short time. There remains, however, in the south-east an entire network on which work has been practically stopped. In the Massif Central numerous stations were being constructed to produce 32,000 kW. On the Truyère, at Brommat, a hydro-electric plant was under construction for producing 56,000 kW. On these enterprises millions have been spent—40,000,000 fr., it is said, for the Brommat plant alone. To-day a collection of simple wooden huts with a few watchmen constitutes all that remains of the former activity. In Brittany, at Guerledan on the Blavet and at Aber-Wrac'h, two installations were being built to furnish 3,900 kW, but this work has been discontinued. All these projects have been stopped because of lack of funds. The construction of a generating station and the equipment of a waterfall involves a heavy initial capital investment. The first sites to be developed were, naturally, those which offered the greatest facilities, and the further the programme of French electrification is developed the more difficult becomes its execution. To-day's cost estimates of developing new water-power are 20 to 30 times higher than those of before the war. Accordingly, in hydro-electric enterprises long periods are required for amortisations.

Long-term money, which cost 5 per cent. before the war, now costs from 13 to 14 per cent., even with enterprises of gilt-edged credit. As the construction costs must be multiplied by 6 or 7, it is easy to see what the charges are which are now burdening the hydro-electric industry. As a result, the amount of invested capital has decreased in recent years. In spite of this, the consumption *per capita* has increased from 150 kWh in 1922 to 197 in 1923, 230 in 1924, and 250 in 1925. The consumption in Germany is said to be only 160 kWh *per capita*, in Italy 185, in Sweden 350, and in Switzerland 780. Only a decisive and rapid monetary reform, it has been asserted, as a prelude to a concrete financial programme, can restore a normal circulation of capital and ameliorate the present situation in French national finance and economics.

Service Notes.

The Air Ministry announces that increases in the Pilots' Section of the Air Force Reserve of Officers are necessary, and a large number of openings present themselves now to young men to be trained as pilots "*ab initio*." At least 50 candidates will be taken by the Air Ministry if the necessary number of the right type are forthcoming. Applicants must be of good education and physique, but need not have had any previous flying experience. They must be over 18 and under 25 years of age. Application forms and further details can be obtained from the Secretary (S.7 Reserves), Air Ministry, Adastral House, Kingsway, London, W.C.2.

Electrical Association for Women.

The first annual meeting of the Manchester District Branch of the Association was to be held on Tuesday last at the Town Hall, Manchester, and to be followed by a lecture on how the American housewife saves labour in the home, given by Mrs. Christine Frederick, of the Applecroft Experiment Station, U.S.A.

At a special meeting on February 15th, at the King's College for Women, Mrs. Frederick lectured on "How the American Housewife Solves Her Household Difficulties," and showed how important a part electricity played in the domestic field in America. She attributed the extensive use of power in the homes of that country to the attitude which the housewife took up in connection with housework. It was to her a profession; 98 per cent. of the American women did the whole of their housework.

On February 18th, Mrs. Frederick also addressed a meeting, at the Lighting Service Bureau, London, when she reviewed the past and present methods of doing housework employed by the American housewife.

Institution Notes.

Institution of Electrical Engineers.

At the ordinary meeting on Thursday, March 3rd, at 6 p.m., papers will be read on "Illuminating Engineering," by Mr. J. W. T. Walsh, M.A., M.Sc., and "The Problems of Public Lighting by Electricity," by Lieut.-Commander H. T. Harrison, R.N.V.R. This meeting will be preceded at 5.30 p.m. by a demonstration in the Common Room, by Mr. Ll. B. Atkinson, of an electro-pneumatic lamp. The lamp, in which hydrogen gas is generated, was patented in 1807, and the one to be demonstrated is believed to be the only example known. It is ignited by a spark from an electrophorus.

Institution of Chemical Engineers.

Examinations for the associate membership of this Institution will be held in June and July next. Particulars may be obtained from the hon. registrar, Mr. C. S. Garland, Abbey House, London, S.W.1.

Institution of Mechanical Engineers.

The annual report of the Council of the above Institution for the year 1926 shows a total membership at December 31st of that year of 10,117, as compared with 9,805 for the previous year. The total expenditure for the year was £33,419, leaving a balance of £443.

Institute of Metals.

The annual general meeting will be held at the Institution of Mechanical Engineers, Westminster, on Wednesday and Thursday, March 9th and 10th. On March 9th the annual dinner will be held at the Trocadero Restaurant, and will be followed by a dance. The annual autumn meeting will be held in Derby from September 6th to 9th.

The Röntgen Society.

According to the *British Medical Journal*, at a special general meeting of the Röntgen Society on January 11th it was agreed to amalgamate the society with the British Institute of Radiology. Negotiations between the two bodies had been proceeding for two years. The title of the new organisation will be "The British Institute of Radiology incorporated with the Röntgen Society." There will be no alteration in the character of the work, objects, and constitution of the society in consequence of the amalgamation.

At a further meeting of the Society on January 25th, the resolution for amalgamation was unanimously confirmed. The British Institute of Radiology will now submit a similar resolution to its members at two statutory meetings.

The Physical Society.

At the annual general meeting on February 11th, Prof. O. W. Richardson was in the chair, when the reports of the Council and of the hon. treasurer were read and adopted and officers and members of Council were elected for the year 1927-28. The president presented the Duddell Medal for 1927 to Mr. F. Twyman, F.R.S., for meritorious work on scientific instruments and materials. Messrs. Adam Hilger, Ltd., to whom Mr. Twyman has for many years been both managing and technical director, enjoys, deservedly, a reputation for the production of optical instruments employed in physical research which is not second to that of any other firm. The presidential address was delivered by Prof. O. W. Richardson, F.R.S., who took as his subject "The Present State of Atomic Physics."

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.

We recently reported that Dr. W. D. COOLIDGE had been awarded the Edison Medal by the American Institute of Electrical Engineers in recognition of his invention of ductile tungsten. Dr. Coolidge has now informed the Institute that he cannot accept the honour in view of the recent decision of a United States court that his ductile-tungsten patent is invalid. The decision referred to is reported in our "Notes" columns to-day.

Agricultural and General Engineers, Ltd., has appointed Sir CHARLES E. LOW, formerly secretary to the Commerce and Industry Department of the Government of India, to take charge of the Indian interests of the group.

Inspector SWINDLEHURST, of the St. Helens Tramway staff, who is retiring after 27 years' service, has been presented by his colleagues with a wallet of Treasury notes, and his wife with a lady's bag. Mr. Swindlehurst has been associated with tramway work for 47 years; he was previously at Liverpool.

Mr. J. A. FORDE, manager and engineer of the Isle of Thanet Electric Supply Co., Ltd., has been presented by the staff with a silver tea-service and tray on the completion of 25 years' service with the undertaking. The presentation was made at the employés' annual dinner by Mr. T. A. Chell, chief assistant.

Mr. HAROLD DICKINSON, city electrical engineer, Liverpool, is taking three weeks' rest in the South of France, owing to ill-health.

Mr. T. M. KIRKBY, who for many years was associated with the Metropolitan-Vickers Electrical Co., Ltd., has joined the staff of the Macintosh Cable Co., Ltd., as assistant sales manager, with headquarters at Derby.

The Edinburgh Salaries and Wages Committee, by six votes to five, recently disapproved of a recommendation from the Tramway Committee that the salary of Mr. STUART PILCHER, tramway manager, should be increased from £1,500 to £1,700 by annual increments of £100.

It is recommended that the salary of Mr. EDWIN SEDDON, electrical engineer and manager to the Edinburgh Corporation, shall be increased from £1,200 to £1,300.

General FERRIE, a leading French wireless authority, recently paid a short visit to this country. A luncheon, at which Sir John Reith, director-general of the B.B.C., presided, was given in his honour last week.

MR. I. MACKINNON, the recently-appointed manager of the Glasgow Corporation Tramways, recommends a re-arrangement of the staff and states that the scale fixed for the chief electrical engineer, civil engineer, constructional engineer, and mechanical engineer is from £600 to £800 per annum.

The Glasgow Corporation Tramways Committee recommends the appointment of Mr. JAMES N. WILSON, now secretary and treasurer, as deputy general manager at a salary of £1,000 a year.

The Newark-on-Trent Corporation has passed a resolution thanking Mr. R. W. WILLIS for the very able manner in which he has carried out his duties, and expressing the pleasure that the Council has experienced in working with him during the installation of electricity supply in the borough.

The Portsmouth City Council has adopted the A.M.E.E. minimum salary scale as the basis of the future remuneration of its chief electrical engineer, Mr. B. HANDLEY.

The *Financial Times* states that Mr. A. SPYER has been appointed general manager of Babcock & Wilcox, Ltd., and Mr. C. S. DAVY assistant general manager.

The address of Mr. W. A. GILLOTT is now 28, Wood Street, Deansgate, Manchester.

Obituary.—DR. J. R. ERSKINE-MURRAY.—Dr. James Robert Erskine-Murray, whose death was briefly recorded in our last issue, was born at Edinburgh in 1868. He was educated at Glasgow University, where he studied under Lord Kelvin for six years. A period as a research student at Trinity College, Cambridge, followed, and later engagements included the post of Assistant Professor of Physics and Electrical Engineering at the Heriot-Watt College, Edinburgh, which he held from 1896-1898; in the latter year he became chief experimental assistant to Mr. Marconi. From 1900 to 1904 he was Lecturer in Physics and Electrical Engineering at University College, Nottingham. After this he spent two years at the George Coats Technical College at Paisley as Lecturer in Electrical Engineering, and a few years later (from 1907-1911) he lectured on Radio-telegraphy at the Northern Polytechnic Institute. He became a partner in the firm of Clark, Forde, Taylor and Erskine-Murray, the well-known telegraph consulting engineers, in 1913, but he left them in the year 1918 in connection with war activities. He did much design and experimental wireless work for the Royal Air Force between 1918 and 1922,

and in the latter year he was promoted to major. His appointment as Experimental Engineer at H.M. Signal School, R.N. Barracks, Portsmouth, followed. He held this position until his death, which occurred at Portsmouth on February 12th, after a very short illness. Dr. Erskine Murray wrote a number of books on wireless telegraph matters, and his demonstration shortly after the war, before the Institution of Electrical Engineers in London, of wireless telephonic communication with an aeroplane in flight, will be remembered by many of our readers. He was a Fellow of the Royal Society of Edinburgh, past-president of the Wireless Society of London, and a Fellow of the Institute of Radio Engineers and of the Institute of Physics. The funeral took place at Edinburgh on Friday.

Sir Frederick Green.—We regret to record the death, which occurred on Friday last, in his 82nd year, of Sir Frederick Green, a founder of the Orient Line and a director of the United River Plate Telephone Co., Ltd., and many other companies.

Mr. A. Berkeley.—Mr. A. Berkeley, wholesale electrical supplier, of 111, Granville Street, Birmingham, passed away on February 15th. The business is for the present being continued by his executors under the management of Mr. Gamble, who has been with Mr. Berkeley for many years.

Mr. W. Auld.—The death occurred on February 12th of Mr. William Auld, head of the firm of William Auld & Sons, electrical engineers, of Ayr. He served on the Town Council for 10 years.

Mr. J. W. Colclough.—Mr. James William Colclough, who had been employed in the electrical department of Messrs. Howard & Bullough, textile machinists, Accrington, for 30 years, passed away recently, aged 63 years.

Mr. W. H. Blurton.—The death occurred on February 9th of Mr. W. H. Blurton, who was electrician to the Highley Mining Co.

Mr. G. H. Alderton.—Mr. George Herbert Alderton, carrying on electrical business at 31, Portland Street, Brighton, recently died at the age of 69 years.

Mr. J. Smith.—Mr. J. Smith, rolling stock superintendent in the Sheffield Tramways Department for the past 22 years, died last week, aged 66 years.

Mr. H. U. Wellington.—The death occurred on February 13th, at the age of 43 years, of Mr. Harry Upson Wellington, electrician at the Duke of York's School, Dover.

Will.—The late Mr. Frederick Leverton Harris, a director of the Metropolitan Electric Supply Co., Ltd., left £257,223 net personalty.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Vacuum Power, Ltd.—Private company. Registered February 12th. Capital, £6,000 in £1 shares. Objects:—To acquire and test an invention in respect of which provisional letters patent for the United Kingdom and the Isle of Man have been granted to C. Scott-Snell and E. Scott-Snell, dated November 11th, 1926, and numbered 28,432, and to carry on the business of mechanical, electrical and experimental engineers, makers of models, &c. The first directors are:—C. Scott-Snell, 47, Linden Gardens, Bayswater, W.2; E. Scott-Snell, 47, Linden Gardens, Bayswater, W.2; J. E. Gibson, c/o Messrs. Price, Waterhouse & Co., Valparaiso, Chile; R. E. Heard, 18, Pembridge Villas, Bayswater, W.11. Qualification, 500 shares. Solicitors: H. M. Meyler & Co., 8, Churton Street, Westminster, S.W.

Mouldings and Insulators, Ltd.—Private company. Registered February 11th. Capital, £1,000 in £1 shares. Objects:—To acquire the business carried on at St. Peter's Court, Lee, S.E.12, as General Mouldings and Insulators, to adopt an agreement with H. F. Shand, J. R. F. Shand, E. A. Leyman and A. H. Norman, to carry on the business as manufacturers of moulded products and other apparatus required in connection with the distribution, supply, generation, and employment of electricity, electrical engineers, &c. The subscribers (each with one share) are:—L. S. Woolf, 37, Walbrook, E.C.4, solicitor; W. H. Burns, 19a, Coleman Street, E.C.2, chartered accountant. Solicitors: B. A. Woolf and Co., 37, Walbrook, E.C.4. Registered office: 19a, Coleman Street, E.C.2.

M. A. Halle & Co., Ltd.—Private company. Registered February 11th. Capital, £1,000 in £1 shares. Objects:—To carry on the business of manufacturers, importers, exporters, and shippers of, and dealers in electrical, magnetic and galvanic apparatus, machinery and accessories, &c. The subscribers (each with one share) are:—M. A. Halle, 26, Brunswick Square, W.C.1, merchant; J. I. Stephens, 353, Grange Road, Upper Norwood, S.E.19, merchant. Qualification, 5 shares. Solicitors: Bulcraig & Davies, Amberley House, Norfolk Street, Strand, W.C.2.

The Ship Carbon Co. of Great Britain, Ltd.—Registered as a private company on February 14th with a nominal capital of £130,000 in £1 shares (65,000 8 per cent. cumulative preference and 65,000 ordinary). Objects:—To adopt an agreement between Schiff & Co. A.G., of the first part, the Anglo-Oriental and General Investment Trust, Ltd., of the second part, and Charles H. Champion & Co., Ltd., of the third part, and to carry on the business of manufacturers of, and dealers in carbon, and all substances and materials containing or capable of producing carbon, chemists, mine owners, electrical and mechanical engineers, manufacturers of, and dealers in mechanical apparatus, lamps, batteries, dynamos, accumulators and appliances, rubber, cork, leather, vulcanite, mica, celluloid and like substances, &c. The subscribers (each with one ordinary share) are:—F. W. Eve, 101, Salisbury House, London Wall, E.C.2, cashier; L. Hillman, 101, Salisbury House, London Wall, E.C.2 clerk. Qualification, 100 ordinary shares. Solicitors: Mawbie & Barrie, 101, Salisbury House, London Wall, E.C.2. Registered office: Anglorient House, 31-33, Bishopsgate, E.C.2.

Premier Products (1927), Ltd.—Private company. Registered February 10th. Capital, £500 in £1 shares. To carry on the business of agents for mechanical, electrical, lighting, heating, hydraulic, pneumatic, ventilating, telephone, telegraph, wireless and consulting engineers, &c. The first directors are:—H. Burrows, 14, Green Street, Ardwick, Manchester, master packer and merchant; G. H. Elliott, 22, Hemingway, Blackpool, accountant. Qualification, 50 shares. Secretary: G. H. Elliott.

Southern Industries, Ltd.—Private company. Registered February 14th. Capital, £7,000 in £1 shares. To carry on the business of electrical, motor and mechanical engineers, manufacturers of and dealers in machinery of all kinds, iron founders, tool makers, brass founders, metal workers, &c. The subscribers (each with one share) are:—W. B. Enever, Broad Street House, E.C.2, articled clerk; A. Wood, Broad Street House, E.C.2, articled clerk. The first directors are W. G. Ball (chairman and life director), W. C. Taylor, F. Cressall, and I. J. Harvey. Qualification, 100 shares. Solicitors: C. R. Enever & Co., Broad Street House, Old Broad Street, E.C.2.

Amalgamated Brake and Signal Co., Ltd.—Private company. Registered February 17th. Capital, £100 in £1 shares. Objects: To carry on the business of manufacturers, exporters and users of and dealers in brake and signal appliances, electrical, mechanical, hydraulic and general engineers and contractors, manufacturers of and dealers in electrical, magnetic and galvanic apparatus, &c. The subscribers (each with one share) are: E. Rudland and V. Summers, 2, Bond Court, Walbrook, E.C.4, clerks. The first directors are to be appointed by the subscribers. Solicitors: Linklaters & Paines, 2, Bond Court, Walbrook, E.C.4.

Indian and Colonial Supply Association, Ltd.—Private company. Registered February 14th. Capital, £3,000 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in electric lamps, torches, batteries, and other similar articles, optical lanterns and slides, photographic apparatus, kinematographs and films, electrical, optical, radio and scientific apparatus, mechanical, electrical and steam toys, &c. The first directors are:—J. Conoley, "Mona," The Leas, Westcliff-on-Sea, wholesale warehouseman; A. E. Cotton, 47, Swains Lane, Highgate, N.6, wholesale optician; L. Conoley, "Mona," The Leas, "Westcliff-on-Sea, traveller. Remuneration as fixed by the company. Solicitors: G. S. Warmington and Edmonds, 14-15, Coleman Street, E.C.2. Registered office: 83-86, Farringdon Street, E.C.

Century Cables, Ltd.—Public company. Registered February 17th. Nominal capital, £100,000 in £1 shares. Objects: To carry on the business of manufacturers of and dealers and traders in wires, cables and all other articles in the electrical and allied trade, and to adopt an agreement with Sir Edward Nicholl and Sir Herbert Blain for the acquisition of a freehold factory at Addlestone, Surrey. The minimum cash subscription is 7 shares. The subscribers (each with one share) are:—W. S. King, 8, Wallace Gardens, Canonbury, N.1, clerk; and six other clerks. The first directors (to number not fewer than two nor more than nine) are to be appointed by the subscribers. Qualification, 500 shares. Remuneration, £250 each per annum (chairman, £500) and 5 per cent. of the profits after 10 per cent. dividend is paid, divided between them. Secretary: G. Smith. Solicitors: Elvy, Robb & Co., 19, Bedford Row, W.C. Registered office: 137, Victoria Street, S.W.1.

Official Returns of Electrical Companies.

Anglo-Portuguese Telephone Co., Ltd.—Trust deed dated February 1st, 1927, to secure £300,000 debenture stock and premium of 2 per cent. charged on the company's rights and interests under the concession by agreements dated April 15th and June 21st, 1901, and the buildings, works, lands, and other immovable property, telephones, plant, machinery, fixtures, lines, and other chattels now or at any time to be appropriated to or used by the company in connection with the working of its system of telephones and lines under the concession and the company's other assets, present and future, including uncalled capital. Trustees: H. Allen, 31, Budge Row, E.C.; and Second Consolidated Trust, Ltd., Dashwood House, Old Broad Street, E.C.

Telephone Manufacturing Co., Ltd.—Satisfaction in full on January 5th, 1927, of land charge, mortgage and charge, and land charge, all dated August 19th, 1924, securing all moneys due or to become due from company to the Midland Bank, Ltd., respectively.

Gilfillan Brothers, Ltd.—C. E. Smedley, of Bush Lane House, Bush Lane, Cannon Street, E.C., was appointed receiver and manager on February 7th, 1927, under powers contained in debenture dated October 15th, 1926.

Joseph Tabbush & Co., Ltd.—Particulars filed of £2,500 debentures authorised January 15th, 1927, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Barnes Bros. (Radiex), Ltd.—A. H. Ballard, C.A., of 6, Fen Court, E.C., was appointed receiver on February 4th, 1927, under powers contained in mortgage dated December 14th, 1926.

Siemens Bros. & Co., Ltd.—Satisfaction to the extent of £30,500 on January 1st, 1927, of debenture stock dated January 15th, 1918, securing £1,330,000.

Jones, Burton & Co., Ltd.—Satisfaction in full on January 31st, 1927, of mortgage or charge dated May 11th, 1921, securing £5,000.

Ajax Production Engineers, Ltd.—A. G. White, of 14, Old Jewry Chambers, E.C.2, ceased to act as receiver or manager on February 8th, 1927.

Claremont, Johnson & Co., Ltd.—W. J. Hodge, of 26 and 27, Union Bank Chambers, Hatton Garden, E.C.1, was appointed receiver and manager on February 9th, 1927, under powers contained in debentures dated October 22nd, 1926.

Evalasio Distributing Agency, Ltd.—Particulars filed of £1,000 debentures authorised February 8th, 1927, charged on the company's property, present and future, including uncalled capital, the amount of the present issue being £850.

City Notes.

Metropolitan Railway Co.

Lord Aberconway (chairman) presided at the annual meeting on February 17th, and in presenting the report and accounts (*vide* our last issue, p. 268), said that the general strike, with the resultant loss of traffic and extra expenses; the coal dispute, which cut down the coal traffic and involved the purchase of high-priced foreign coal; and the loss of the Exhibition traffic, represented a total loss of £300,000 to the company—equivalent to a 4 per cent. dividend on the ordinary stock. After dealing with the accounts and the developments proceeded with during the year, the chairman referred to the continued growth of competition from motor traffic. He characterised this form of traffic as a subsidised business, it being free from the burdens which the railway companies had to bear. He considered that the proportion of road construction and maintenance costs borne by motor traffic was inadequate; in effect, the railway companies, as ratepayers, were aiding their competitors. The character of the company's business was gradually changing. The long-distance traffic was increasing, but not at so fast a rate as that at which the short-distance traffic was being taken from them. The company was being assisted considerably by the operations of the Metropolitan Railway Country Estates, Ltd., which was opening up new districts. The report and accounts were adopted.

The "Underground" Group.

In our last issue we recorded the final dividend announcements of the companies forming this group. We have now received their reports for 1926 which were to be presented at the annual meetings yesterday (Thursday). These reports are summarised below:—

London Electric Railway Co.—The traffic receipts rose by £64,344 to £1,978,527, while the expenditure increased by £35,354 to £1,167,168, leaving net receipts of £811,359—an increase of £28,990. The addition of miscellaneous receipts and the balance brought forward gives an available sum of £1,103,789, as against £1,045,331. Interest, rentals, &c., absorb £504,849; £45,000 is transferred to reserve for contingencies and renewals; and after meeting preference and consolidated ordinary dividends, £100,515 is carried forward. The capital expenditure was £1,212,702, the principal item being the Charing Cross-Kennington extension (£974,622). Reference is made in this, as well as the other, reports to the adverse effects of the coal stoppage upon revenue and working expenses. The Bill promoted by the company and the Metropolitan District Railway Co. received the Royal Assent in August last. The Charing Cross-Kennington extension was opened for traffic in September, but the reconstruction of the Piccadilly Circus station was delayed by the mining dispute. The passimeter system was installed at several stations. The board has decided to renew the bodies of the company's original rolling stock. The death of Mr. Z. E. Knapp is recorded, and it is stated that Sir Ernest Clark, K.C.B., was appointed to the vacancy on the board thus created.

City and South London Railway Co.—This company's traffic receipts rose by £113,619 to £652,929, and the expenditure by £87,579 to £353,212; the net receipts thus increased from £273,677 to £299,717. The addition of miscellaneous receipts gives a total of £362,249 as net income, and to this is added £25,037 brought forward, making £387,286. After deducting interest, rentals, and other fixed charges; transferring £25,000 to reserve; and meeting the preference and consolidated ordinary dividends, there remains £29,327, which is carried forward. The expenditure on capital account was £1,015,114 (net), the largest item being £2,973,871 for the extension from Clapham Common to Morden; this extension was opened for traffic in September, and the results have exceeded expectations. The remodelling of, and the installation of escalators at, the Oval and Clapham North stations have been completed. The report mentions the death of Lord Stuart of Wortley (deputy chairman) and Mr. Z. E. Knapp.

Central London Railway Co.—The traffic receipts at £553,793 showed an increase of £42,447, and the expenditure at £365,469 a rise of £25,219. The net receipts thus rose from £171,096 to £188,324. Miscellaneous receipts amounted to £85,638, and the addition of these and the balance brought forward gives an available amount of £354,970, an increase of £9,128. Rentals, interest, and other fixed charges absorb £102,523; £40,000 is put to reserve; and after paying dividends a balance of £70,847 is carried forward. Only £47,174 was spent on capital account during the year, mainly upon the installation of escalators. Work commenced upon the improvement of the rolling stock, and steps have been taken to increase the speed of operation. The reconstruction of the Bond Street station is nearly accomplished, and escalators at this station and Tottenham Court Road are now in service. Lord Newton has been appointed to the board.

Metropolitan District Railway Co.—The traffic revenue for 1926 was £1,640,665, and the expenditure £1,122,047, showing increases of £5,887 and £19,962, respectively. The net receipts were therefore lower by £14,075, the figure being £518,618. The addition of miscellaneous receipts and the balance brought forward gives an available sum of £767,345. After meeting interest, rentals, &c., transferring £45,000 to reserve, and paying dividends, a balance of £41,501 is carried forward. The capital expenditure amounted to £93,020, plant and machinery at the Acton and Ealing Common works accounting for £62,022. Among the improvements carried out during the year were the re-arrangement of signalling on the main line and the installation of the passimeter system at several stations. The extension of the Acton works is almost com-

pleted. This will enable the company to repair and maintain the rolling stock of the associated companies as well as its own stock. Arrangements are being made for the erection of a modern office block near St. James's Park station for the accommodation of the staff of the company and its associates.

Summary of Results.—We reproduce below a comparative statement of the four companies, which, with the London General Omnibus Co., Ltd., participate in the "Common Fund":—

	1926. £	Increase+ Decrease− £
Traffic receipts	4,825,914	+226,297
Expenditure	3,007,896	+168,114
Net receipts	1,818.018	+ 58,183
Miscellaneous receipts (net) ...	537,699	+ 33,447
Net income	2,355,717	+ 91,630
Deduct Interest, rentals and other fixed charges	1,222,620	+116,399
Appropriation to reserve for contingencies and renewals ...	155,000	—
Dividends on guaranteed and preference stocks	389,477	—
Balance	588,620	− 24,769
Add balance from last year's accounts	257,673	+ 9,286
Total amount available for dividends on ordinary stocks and shares and for other purposes	846,293	− 15,483
Dividends on ordinary stocks and shares (average rate 3.54 per cent.)	604,103	—
Balance carried forward	242,190	− 15,483

Traffic Figures.—With the exception of the City and South London Railway, the traffic again decreased. The figures for the four companies were as follows:—

	1926.	Decrease.
Passengers carried—		
Ordinary	210,470,208	7,444,288
Workmen	50,580,564	836,422
Seasons	48,727,502	642,856
Total	309,778,274	8,923,566
Number of car-miles run	65,398,129	38,584

Yorkshire Electric Power Co.

The annual meeting was held at Leeds last week. Mr. A. G. Lupton (chairman), who presided, said that at great cost the company had been able to maintain the supply to its consumers throughout the period of the coal dispute. Although some of the coal imported was of a very inferior quality, much of it was excellent for steam raising. The agreements with many consumers embodied a coal clause, and if the company were to insist upon the enforcement of these the consumers would be called upon to pay considerably increased amounts, although a substantial amount would be returnable in July next if the price of coal remained normal. The company had decided, at some loss to itself, to assume a lower price for the past half year than the actual price. He felt that the consumers would appreciate this arrangement. During the year the demand for bulk supplies of electricity had increased, and the company was now supplying over 39,000 consumers directly and indirectly. The amount spent on capital account was larger than in any previous year, owing mainly to the construction of the Ferrybridge station and the laying of further 33,000-V transmission mains. The completion of the Ferrybridge station had been delayed, but on January 8th the first of the large turbo sets was put into service and was now running on load. The whole station would soon be in commission. The issue of £773,000 6 per cent. cumulative preference shares was very successful, and again added to the number of shareholders in the company, which now totalled 5,389. The company was asking for Parliamentary powers to borrow up to one-half (instead of one-third) of the issued capital. It was advantageous to raise money in this way, and he thought that the company would be able to offer a lower rate of interest than 5½ per cent. when the next issue of debentures was made. The existing debentures would have to be repaid first, however. The dividend of 8 per cent. had become a standard for the company, and it was paid after placing £60,000 to reserve and £25,000 to the plant renewal fund. The report and accounts were adopted.

Electrical Distribution of Yorkshire, Ltd.

The net profit for 1926 was £46,768, as compared with £31,099 in the preceding year. To this is added £14,114 brought forward, making £60,882. It is proposed to transfer £10,000 to reserve (making £47,000), and to pay a final dividend of 4½ per cent. on the ordinary shares (making 9 per cent. for the year), leaving £15,837 to be carried forward. The report says that there was a notable increase in the sale of electricity for street lighting and for new housing estates supplied through prepayment meters. There has been a large increase in the number of consumers in all districts, and the developments have enabled the company to reduce its charges in spite of the difficulties engendered by the coal dispute. During the year new Orders were obtained for the supply of electricity in the following districts: Baildon, Dodworth and Thurlstone, Queensbury, Ryburn Valley, South Yorkshire (extension), and Wetherby. The company now has an area of over 960 sq. miles with a population of 668,000. It is proposed to issue 300,000 ordinary shares forthwith at the price of 25s. per share, and these will be allotted to present shareholders in the proportion of three new shares to each five held. Meeting: March 1st.

Power Securities Corporation, Ltd.

In moving the adoption of the report at the annual meeting last week, Mr. G. Balfour, M.P. (chairman) referred to the death of Sir James Kemnal, an original director of the corporation and a director of Balfour, Beatty and Co., Ltd. He said that during the year the corporation had successfully handled the finance of a number of electrical and other undertakings at home and abroad, and Balfour, Beatty & Co. and the South American business were developing a number of contracts. The Lochaber water-power contracts were making progress. The Grampians development would have been commenced last year but for uncertainty regarding the effects of legislation. It is anticipated that progress will be made with the scheme during the current year. He (the chairman) had taken a somewhat prominent part in the proceedings relating to the Electricity (Supply) Act. Although he disliked the principle of the Act, they would do their best to make it a success now that it was upon the Statute Book. The company's investments were valued at £1,104,592, and 46 per cent. of this was represented by investments in electricity supply and allied undertakings. A further 22½ per cent. represented their holding in Balfour, Beatty & Co. Loans and participations totalled £139,142, as against £72,010. Approximately £64,000 was on account of the holding in the Hydro-Electric Development Co. and in two electricity supply undertakings purchased in connection with the Grampians scheme. The balance was their holding in a Spanish electrical company of which Balfour, Beatty & Co. were acting as engineers and managers. The Corporation's development might call for the issue of some of the authorised capital; at present only half of the £2,000,000 had been issued. The report and accounts were adopted.

Northampton Electric Light and Power Co., Ltd.

The report for 1926 records continued progress, in spite of the coal stoppage, the energy sold having increased from 14,278,101 to 18,471,276 kWh. In April last the capital was increased to £500,000, and the premiums received (£22,187) has been credited to the reserve. A further amount of £86,000 5 per cent. debenture stock was also issued. From the year's revenue £24,785 has been allocated to depreciation, £5,000 written off debenture discount and expenses, £4,813 transferred to reserve, and £1,000 to the employés' benefit fund. It is proposed to pay a final dividend of 5 per cent. on the ordinary shares, making 9 per cent. for the year, as for 1925, and £8,077 is to be carried forward. The report records the death of Mr. T. A. Dickson and the resignation of Mr. E. M. Browne, and the filling of their places on the board by Messrs. L. H. Church and F. Kilby.

Torquay Tramways Co., Ltd.

The report for 1926 records a profit of £29,241, and after providing for debenture interest and sinking fund there remains a balance of £22,641, to which is added £1,703 brought forward, making £24,344. Of this, £5,000 is transferred to reserve, income tax provision absorbs £4,200, and £111 is allowed for depreciation. It is proposed to pay a final dividend of 4 per cent. and a bonus of 1 per cent. (both free of tax) on the ordinary shares, making 9 per cent., tax free, for the year, and leaving £1,533 to be carried forward. The number of passengers carried, the car-mileage, and the revenue all showed increases, although the cost of energy was £2,000 higher on account of the coal dispute. The company's associate, the Devon General Omnibus and Touring Co., Ltd., has paid its preference dividend, and carries forward £1,802.

Mersey Railway Co.

The report for the year ended December 31st last records receipts of £217,480, and expenses of £147,536, leaving a balance of £69,944. To this are added £10,405, miscellaneous receipts, a balance of £2,325 brought forward, and £10,000 from special reserve, making £92,674. Interest, rentals, and other fixed charges absorb £65,928, £6,000 is transferred to depreciation and renewal funds, and it is proposed to pay the full dividend on the 3 per cent. perpetual preference stock, leaving £1,274 to be carried forward. The board recommends the appointment of Mr. C. A. Jones as a director. The meeting was to be held yesterday (Thursday).

Smithfield Markets Electric Supply Co., Ltd.

The net profit for the past year, after providing for debenture interest and redemption and depreciation, was £6,729. To this is added £2,394 brought forward, making £9,123. It is proposed to pay a final dividend at the rate of 5 per cent. (1s. per share), making 8 per cent. for the year. After transferring £2,000 to reserve, a balance of £2,323 is carried for-

ward. Further progress was made during the year, and the revenue was well maintained. Sir Herbert Leon, Bart., the chairman, died during the year, and his place as chairman has been taken by Sir George Leon, Bt. The vacancy on the board has been filled by the appointment of Mr. G. M. Powell, the manager and secretary, as director. Mr. A. W. Wilson has been appointed trustee for the debenture holders. The meeting was to be held on Wednesday last.

French Companies.

The *Câblerie Phoceenne*, Marseilles, has declared a dividend of 30 fr. per share for 1924-25.

The *Société des Lampes Gramme* reports net profits of 473,000 fr. for 1925-26. After placing 348,000 fr. to depreciation, the balance has been carried forward.

The *Société Centrale pour l'Industrie Electrique* reports net profits of 4,573,000 fr. for 1926; the dividend is 45 fr. per share, as against 40 fr. in 1925.

The *Compagnie Générale Parisienne de Tramways* records net profits of 3,231,000 fr. for 1926. It is proposed to maintain the dividends paid for 1925 of 16 fr. per priority share, 13.5d. fr. per ordinary share, and 3.50 fr. per deferred share.

County of London Electric Supply Co., Ltd.

The ordinary share capital as increased by the recent bonus issue is to receive a final dividend of 5 per cent.; the interim dividend on the original capital was also 5 per cent. For 1925 a total of 15 per cent. was paid.

At general meetings held on February 17th the holders of the company's first and second debenture stock approved the conversion of their holdings into Government 4 per cent. consolidated loan at the rates of £115 per cent. for the first debenture stock and £112 10s. per cent. for the second debenture stock.

German Company.

The *Electricity Company* (late *Schuckert*), Nuremberg, reports receipts from installations, undertakings and securities amounting to 4,779,000 marks, as compared with 2,844,000 marks in 1924-25. After meeting general expenses, taxes, depreciation, &c., the accounts show net profits of 3,616,000 marks, as against 1,979,000 marks in the previous year It is proposed to increase the rate of dividend from 4 per cent. to 7 per cent.

Swedish Company.

The directors of the *Allmanna Svenska Elektriska Aktiebolaget* report that after providing for depreciation and taxes, the net profits for 1926 were 3,938,000 kr., which compares with 3.011.000 kr. in the previons year. It is proposed to pay a dividend of 5 per cent., as against 4 per cent. in 1925. The stock of orders on hand is satisfactory, and the company's position is said to be strong.

Rushden and District Electric Supply Co., Ltd.

From the revenue for 1926, £2,240 is allocated to reserve, £140 to the writing off of debenture expenses, and £500 is transferred to reserve. A final ordinary dividend of 4½ per cent. is recommended, making 8 per cent. for the year (as in 1925), leaving £1,021 to be carried forward. Mr. R. E. Lamb has been appointed to the vacancy on the board caused by the death of Mr. T. A. Dickson. The amount of energy sold rose from 1,131,691 to 1,300,823 kWh.

Wellington Electric Supply Co., Ltd.

The report for 1926 shows that after allocating £3,000 to depreciation there is a balance of £4,728. After meeting debenture charges, &c., and crediting the balance brought forward, there remains £5,396. From this £1,000 is put to reserve and a dividend of 5 per cent. is paid, leaving £2,146 to be carried forward. There was an increase in the amount of energy sold.

Marconi's Wireless Telegraph Co., Ltd.

In spite of a recommendation from its sub-committee, the Shareholders' Committee has refused to accept in advance the recommendations of the Advisory Committee (consisting of Sir Hugo Hirst, Bart., Lord Ashfield, Lord Buckland, and Mr. F. A. Szarvasy). The latter committee has therefore notified the company that it cannot accede to the company's request that it should act as an advisory committee.

Stock Exchange Notices.

Application has been made to the Committee to allow the following to be officially quoted:—

Auckland Electric Power Board.—£250,000 5 per cent. water power conversion and general extension purposes debentures.

County of London Electric Supply.—1,773,334 ordinary shares of £1 each, fully paid, Nos. 1,330,001 to 1,500,000 and 5,000,001 to 6,603,334.

South London Electric Supply Corporation.—234,000 ordinary shares of £1 each, fully paid, Nos. 310,001 to 544,000.

Companies to be Struck off the Register.

The names of the undermentioned companies have been struck off the Register, and they are thereby dissolved:—

Caergwrle and District Electricity Supply Co., Ltd.
Standard Electric Welding Co., Ltd.

Mather & Platt, Ltd.

The directors have declared a final dividend of 5 per cent. (making 10 per cent. for the year), together with a bonus of 5 per cent., both free of tax. £164,458 is carried forward. The dividend and bonus for 1925 were the same.

South London Electric Supply Corporation, Ltd.

The directors recommend a final dividend of £5 17s. 6d. per cent. on the ordinary shares; an interim distribution of 5 per cent. was made on the capital then existing. Last year's total dividend was 15 per cent., but since then the capital has been increased by a bonus share issue.

Chas. Clifford & Sons, Ltd.

Out of a reduced net profit of £10,833 (plus £41,305) brought forward it is proposed to pay a final ordinary dividend at the rate of 10 per cent. for the six months and a bonus of 5 per cent., both free of tax.

Scottish Power Co., Ltd.

The profit for the past year was £62,281 gross and £47,083 net. A dividend of 8 per cent. has been declared on the ordinary shares, £8,000 is transferred to reserve, and £2,718 carried forward.

Crossley Bros., Ltd.

The net profit for 1926 was £50,095, plus £51,221 brought forward. After paying the balance of the preference dividend £73,079 is carried forward. The ordinary shares last received a dividend in 1920 (3 per cent.).

Midland Counties Electric Supply Co., Ltd.

The directors recommend a dividend of 6 per cent. on 1,250,000 ordinary shares, and at the rate of 6 per cent. upon instalments paid on 250,000 ordinary shares.

South Metropolitan Electric Light and Power Co., Ltd.

A final dividend of 6 per cent. is recommended upon the increased ordinary capital. The interim dividend was 5 per cent. Last year's total dividend on the smaller capital was 15 per cent.

Aberdeen Suburban Tramways Co., Ltd.

There was a loss of £1,189 during the half-year ended January 31st last. This is deducted from the balance of £2,426 brought forward, leaving £1,237.

Shawinigan Water and Power Co.

A dividend of 50 cents per share has been declared on the common shares of no-par value for the quarter ending March 31st.

Clyde Valley Electrical Power Co.

It is proposed to pay a final dividend of 5 per cent. on the ordinary shares, making 8 per cent. for the year, as for 1925.

O. C. Hawkes, Ltd.

A final dividend at the rate of 14 per cent. is recommended on the ordinary shares, making 10 per cent. for the year.

Australian Company.

The Australian Wireless Co., Ltd., is increasing its capital to £200,000 by the issue of 175,000 shares of £1 each.

Bruce Peebles & Co., Ltd.

The directors recommend a dividend of 10 per cent. on the ordinary shares for the year ended December 31st last.

Stocks and Shares.

MONDAY EVENING.

STOCK Exchange markets are less buoyant than they have been of late. The China uncertainty and a fear of money becoming dearer instead of easier; disclosure of a rather ragged speculative account in the oil market; a continuance of the new issues which follow too closely upon each other's heels—these are some of the causes that impose a check upon the exuberance hitherto shown this year. People are disposed to hold their hands. The new 4 per cent. consolidated stock, quoted at 15s. premium a month ago, is soberly priced at 3s. 9d. discount, and gives the lead to many other investment securities.

The Underground Electric Railways group is very firm, the £1 shares rising 1s. to 15s. Dividends in the combination were given here last week (ELECTRICAL REVIEW, p. 269), and it may be of use to mention the proportions in which the receipts of the pool are divided, these being at the same rates as the 1925 distributions. The District draws 12 per cent. from the pool, or "common fund," as it is called. The London General Omnibus takes 25 per cent., the London Electric Railway 41 per cent., Central London 16, and City and South London 6 per cent. By the report of the

London General Omnibus Company, it will be noticed that 1,249,000,000 passengers were carried last year, an increase of 13 millions. Total receipts came to £8,683,607; expenses took £8,323,915. Included in the latter amount is £352,000 for depreciation. The company worked at the narrow margin of 4 per cent., its ratio of expenditure to receipts being 96 per cent., a rise of nearly 1 per cent., as compared with the 1925 proportion.

Districts are 1 higher at 59, and Metropolitan consolidated shows ½ loss on the week. A jump of 3 points in London United Tramways 4 per cent. debenture has lifted the price to 49¼. A little business developed in the preference shares, and the price strengthened to 4s. 9d. London and Suburban Traction preference remain at 6s. 6d. The ordinary shares occasionally change hands at 1s. and thereabouts.

The Electrical Distribution of Yorkshire Company, whose shares stand at 29s. 6d., will hold its meeting on March 1st, when proposals are to be submitted authorising the issue of 300,000 new ordinary at 25s. Three new shares are to be offered in respect of every 5 old shares now held. There will be, of course, a premium in the market on the new, when these are issued. The company is paying 9 per cent. for 1926. Northampton Electric repeats its previously-paid 9 per cent., the company's net profit of £44,150 being £250 up, on the year. The Smithfield Markets Electric Supply net profit is down on the year, but the dividend is maintained at 8 per cent. on the ordinary shares. The coal strike and increased taxation are given as reasons for the smaller profit.

Clyde Valley ordinary are 1s. higher at 29s. 6d. The company's final dividend of 5 per cent. makes 8 per cent. for the year, the same as before. Folkestone Electrics at 39s. 6d. show an improvement.

Westminster Electric ordinary weakened to 25s., to which price St. James' have advanced. It becomes increasingly apparent that 25s. is about the level to which London electricity supply shares will approximate with closeness until something happens to remove the list from its "groovy" character. At this price, the eventual 7 per cent. dividends likely to be paid by the companies, on their ordinary shares, will give a yield of £5 12s. on the money, although for the half-decade to the end of 1931, the returns are fairly sure to be higher. The former income is not bad for a thoroughly sound industrial investment, but, at the same time, it is not large enough to tempt new buyers unless there is a low Bank Rate ruling. Charing Cross have hardened to 25s. 6d., as the company has an extra five years tenure under its existing conditions of dividend payment. County of London shares are a trifle lower at 28s.

No change beyond a rise to 8⅜ has to be recorded in the market for cable and telephone issues. The manufacturing shares remain inanimate. Siemens shed a few pence to 29s. 6d. Telephone Manufacturing continue to be a dull market at 7s. 6d.

Marconis pursued what has now become almost a weekly habit, rising to 16s. and then reverting to 15s. Proprietors will feel disappointed at the turn which events have taken, leading to the refusal of the Advisory Committee to act. The Advisory Committee laid it down as a "cardinal principle" that any recommendation they should make would be supported by the Marconi Board and by the Shareholders' Committee. The latter has declined to accept this, and affairs are, for the time being, at a deadlock.

The issued share capital of the Marconi Company is £3,250,000 in ordinary shares of £1 each—some of which were offered to shareholders at £3 per share—and £250,000 in 7 per cent. cumulative participating preference shares. There is also outstanding an amount of £1,354,000 in 6½ per cent. convertible 10-year first debenture stock. The preference shares stand at 22s., and the debenture stock is quoted at 95 middle. In view of the unquestioned importance of the undertaking, the commanding position that it occupies in the sphere of wireless, its far-reaching ramifications, and its scope for immense extension, there is something lamentably pathetic in the present position. The sub-committee is now engaged upon a report containing recommendations designed to secure the success to which, as it maintains, the company is entitled, and which, it significantly adds, would long since have been attained with efficient administration.

Mexican affairs continue to hold out a reasonable hope of pacification in the country, and a steady return to business prosperity. On these grounds favourable attention is paid to the shares and bonds of the utility companies. Gains of 2 points have lifted Mexican Light and Power common shares to 42, and the company's first mortgage bonds to 70½. It is confidently affirmed by people in close touch with the country that the long-expected scheme is nearly ready for dealing with the question of interest arrears on the Mexican Light and Power preferred shares. Other foreign traction and lighting descriptions are quiet, Brazilian Tractions being a dollar lower, at 121. The troubles in China are not affecting this department to any marked extent, apart from the indirect influence that they exert over investment prices as a whole.

Rubber shares begin to exhibit signs of vitality, and there is a vague idea that the market may derive advantage from the check administered to the previous excitement in oil shares. The engineering group is quiet, with daily price movements narrow and irregular. In the metal market the price of copper has rallied from the price recently reached, the lowest touched for years past.

Our Foreign Electrical Trade.

Electrical Exports and Imports during January, 1927.

FOLLOWING upon last year's excellent showing, the new year opened well for the electrical export trade, auguring a period of record prosperity. It must be admitted that the increase of exports in January as compared with December was due to the rise in shipments of submarine telegraph and telephone cable, but this only accounted for about a half of the increase in the comparison with January, 1926. In placing the January list against that of the previous month, it will be seen that decreases predominated, the greatest being a fall of £51,818 in exports of telegraph and telephone instruments and apparatus, while the non-submarine cable sections showed declines. In the machinery class, however, there were satisfactory increases—£45,000 in the case of unenumerated machinery and £50,539 in railway and tramway motors. Comparing the figures with those of January last year, the increases are seen to be greater in number. Apart from the increase in submarine cables already referred to, the machinery section was responsible for the rise in the total, the aggregate increase in the three items being £139,753. The only decrease of consequence was the fall of £15,032 in the value of exported telegraph and telephone wires and cables (not submarine).

Only one of the import items was higher than in December, *viz.*, insulated wires and cables, which rose by £4,375. The result was a decrease of £62,769 in the total, over half of which was due to lower values in respect of batteries and accumulators and unenumerated electrical machinery. As compared with January, 1926, however, there was a fairly general increase in imports and, strangely enough, the principal rises occurred in the cases of unenumerated electrical machinery and batteries and accumulators. The principal decreases were in telegraph and telephone wires and cable (not submarine) and unenumerated goods and apparatus.

The comparatively unimportant re-export section dwindled still further; the increases and decreases were balanced in number, but the former were much greater in magnitude. The decrease in comparison with January, 1926, was not so great.

Brazil's Electrical Imports.

Official statistics in some detail have just been issued relating to the foreign trade of Brazil in 1925. The values of Brazilian imports of electrical goods in that year, compared with 1924, are given below, together with a note of any increase or decrease. Particulars regarding the countries of origin of this material are not available:—

	1924. £ (thous.).	1925. £ (thous.).	Inc. or dec. £ (thous.).
Insulated electric copper wire	115	75	— 40
Electric cables	125	125	—
Insulators	66	62	— 4
Machinery for electricity and electric light ...	865	965	+100
Electric light carbons ...	30	14	— 16
Dynamos and generators	129	197	+ 68
Electric lamps	139	187	+ 48
Motors	274	306	+ 32
Transformers	172	145	— 27

Siamese Electrical Imports.

Although the value of electrical goods and apparatus imported into Siam rose from £74,852 in 1924-25 to £76,964 in 1925-26, Great Britain's share declined from £26,000 to £22,400. This country is still, however, the largest exporter to Siam of this class of goods. In 1925-26 the values of goods supplied by our largest competitors were as follows:—Germany, £10,811; Japan, £9,556; United States, £9,411; and Belgium, £8,000 (approx.). The last country's share was almost three times as large as in the previous year. This information is contained in a recent report on Siamese conditions prepared for the Department of Overseas Trade by Mr. J. F. Johns, Consul-General at Bangkok. (Stationery Office, 1s. 6d. net.)

Polish Foreign Electrical Trade.

According to the *Board of Trade Journal*, the imports of "apparatus, conductors and other electrotechnical materials" into Poland during December last were valued at 2,712,000 gold zloty (£108,000), while the value of Poland's exports of the same class of materials was 16,000 gold zloty (£640).

The British Industries Fair.—II.

Functions and Exhibits at London and Birmingham.

THE Fair is now open, and there is great activity both in London and in Birmingham. Last Friday the preliminary Press view took place at Birmingham, and one was very favourably impressed with the extensions and improvements that have been made. Mr. T. R. Martin, the chairman of the Management Committee, in addressing representatives of the trade and newspaper Press, said that the Castle Bromwich show was the largest and most comprehensive collection of British goods ever marshalled together. He acknowledged the efforts of the Press, of the exhibitors, and of the officials who had helped to carry the Fair to a successful issue. It was a means for furthering British trading everywhere, and manufacturers could help materially by giving early notice to the organisers that they would exhibit again next year. In 1928 they would be able to bring to this country an influx of foreign buyers such as this country had never experienced if manufacturers would make known their intentions. He urged British firms to link up definitely with the Fair, forming an integral part of it by means of composite displays of particular industries. Mr. Martin said that Birmingham now possessed the finest permanent Fair buildings in the country, with unlimited scope for future extensions. If British goods were to be sold, they must be seen, and if all British manufacturers took part in the Fair, the buyers would feel compelled to come and see. The Birmingham exhibits this year number 600, as compared with approximately 400 last year. We pass on to the trade Mr. Martin's assurance that any buyer will be welcomed at Birmingham whether he has received the official invitation or not. Entrance can be obtained on presentation of his trade card or other satisfactory trade credentials.

On Monday evening, at the Mansion House, the Prince of Wales was present at a banquet given by the Government to mark the opening of the Fair. Sir Philip Cunliffe-Lister, President of the Board of Trade, presided. The large and distinguished company present included our Colonial High Commissioners, many foreign Ministers and Ambassadors, and men of eminence in various departments of trade activity at Home. The Prince delivered a lengthy, well-thought-out speech regarding British industry and trade, and some of the essentials for future success. The situation was very promising, and we were looking forward with a more cheerful spirit after all that we had passed through in 1926. He dwelt upon the qualities of enterprise and enthusiasm as the most necessary at the present time; the importance of foreign travel, collective action in industries, standardisation, better salesmanship, the freer use of foreign languages, the willingness to acknowledge that there was something new to learn every day, and other points making for efficiency. We must adopt as our policy: "Adopt, Adapt, Improve."

On Tuesday the Prince visited the Fair at Birmingham. To-day, Friday, is the first of the Electrical Days there. Others are as mentioned in the programme published here last week.

We continue below our description of the principal exhibits. In London, 900 firms are exhibiting this year, as compared with 600 a year ago. The number would have been larger but for the limited accommodation available.

The Fair remains open until March 4th.

THE BIRMINGHAM SECTION.

Macintosh Cable Co., Ltd.

The exhibit of this company includes a wide range of products, from a patent system of wiring to examples of the latest types of e.h.p. cable. An interesting feature of the display is the demonstration of various tests upon the cable-insulating and sheathing compound "Maconite." Lengths of cable thus insulated are shown immersed in various acids, alkalies, &c., with the current passing through them. The object of this feature is to demonstrate the suitability of "Maconite" cables for use under such difficult conditions as are found in chemical works, on board ship, in railway tunnels, and in collieries. Of particular interest to mining engineers are the specimens of the new Macintosh trailing cable. The salient features of the new cable are:—Each "Maconite" insulated core is separately wrapped in tinned copper strand, giving flexibility and easy access in case of damage. Being continually earthed, the wrappings prevent short circuiting of the phases; and the main earth core is completely protected from damage, being central between the phase cores. The cable is made in two forms, one for use with any type of gear and one for use with the Williams-Rowley earthing system and its gate-end switch. By means of a specimen of this type of switch (made by Switchgear & Cowans, Ltd.) the Williams-Rowley system is demonstrated. The special cable has an insulated pilot conductor carrying a low-voltage current, energised by a transformer. The circuit is made through the earth core and energises the special trip device of the gate-end switch in the event of a faulty earth. Samples of "H"-type super-tension cable for working pressures of 33,000 volts and over are exhibited. (This type of cable was described in our issue of December 17th, 1926.) The essential principle is the wrapping of each of the three cores with metalised paper, which is maintained at earth potential by contact with the other cores and with the lead sheath. Tangential stresses are thus eliminated. Wired showboards display the latest developments of the Macintosh wiring system and its accessories. The system of wiring by lead-covered "Maconite" is also shown in this way. A range of boxes and accessories made for town services, &c., is included in the exhibit.

Chloride Electrical Storage Co., Ltd.

Upon this stand appears a full range of batteries suitable for every application. A selection of different types of "Chloride" batteries for house lighting is displayed, comprising both the open type and the new fully-charged, sealed-in type, which is adopted by the chief lighting-set manufacturers in this country. The batteries on exhibition include specially-designed types for radio work, including the latest developments in h.t. batteries, exemplified by the "WH type" 24-V units in multi-compartment glass boxes, and the "WJ-type" 20-V units assembled in wood crates. The usual range of batteries in celluloid boxes, together with "DTG" and "DFG" cells in glass boxes, are also on view. Higher-capacity batteries are available for inspection, and types for marine wireless installations and lifeboat sets, together with others designed for emergency lighting and gyro compass operation on board ships are represented. Other exhibits include Exide-Ironclad batteries for traction purposes; special cells for miners' handlamps and portable batteries; and specimens of the "Lux" battery, specially designed for train lighting.

Park Royal Engineering Co., Ltd.

This is a comprehensive exhibit of modern switchgear and instruments ranging from an 11,000-V heavy rupturing capacity oil switch, and a 6,000-A air circuit breaker, down to a 2½-in. ammeter. A large capacity oil switch exhibited is one of a number recently made for the Bolton Corporation. Its massive appearance, it being built up on heavy iron framing, gives no suggestion of the ease and smoothness with which it is operated. The operating handle for replacement is of the "loose handle" type and has a throw of 180 deg. in a downward direction (to close the switch) and by means of a double toggle mechanism shows the position "On" or "Off" A prominent feature of the switch is the arrange-

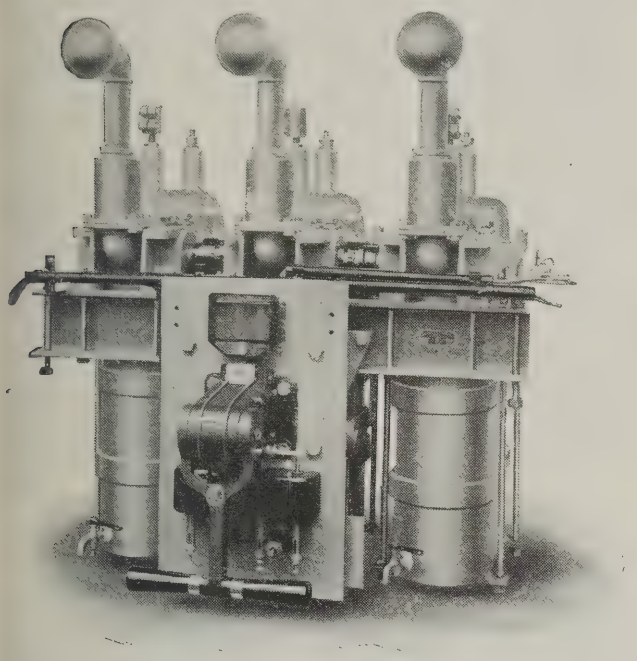

Fig. 7.—A Large Park Royal Oil Switch.

ment of ample vent pipes, a necessity for switches of large breaking capacity. The gear is illustrated in fig. 7. A draw-out cubicle is exhibited. The whole of the operating mechanism can be withdrawn for attention when required, the contacts in the fixed portion being automatically covered up and rendered fool-proof. The oil switch is on similar lines to the one described above, but of proportionate size for the cubicle. Another type of oil switch of this company's design is one for wall mounting, for use in sub-stations, or for industrial purposes. It is fitted with the usual automatic features, and may be either single-, 2-, or 3-phase, for pressures up to 2,000 V. Air circuit breakers are represented by a 6,000-A, single-pole, overload type, direct operation. This, again, combines ease of operation with massive construction. An example is also shown of an electrically-operated circuit breaker where necessity or convenience requires the breaker to be re-set from a distance. Besides these types for exceptional use, examples are shown of the switchboard type of breaker, the special features of which are a definite catch so that vibration will not open the breaker, hand tripping by means of a key, and the usual qualities of ample construction and observance of B.E.S.A. standard specifications. Hand switches and self-aligning fuses are also to these specifications. The company produced instruments before it commenced making switchgear, and the latest development in this direction is the introduction of a patented method of protecting the pivots by the provision of small springs which, whilst inert in normal operation of the instrument, come into play if the instrument is subjected to shock. The adoption of this device therefore transforms what was hitherto a delicate and easily damaged instrument into a robust and serviceable unit. This device is applicable to both miniature instruments and large ones, and the company has a large range varying from a number of small models suitable for portable use, motor cars, &c., up to large illuminated dial instruments suitable for central station switchboards.

Electricars, Ltd.

The principal exhibit of this company is a 30-cwt. low-loading vehicle developed to meet the demand for one possessing a very low loading line and capable of manœuvring in narrow streets and entrances presenting difficulties to a machine of ordinary dimensions. The wheelbase is 7 ft. long, and the vehicle has a turning radius of 13 ft. Wheels of 20-in. diameter permit of a chassis height of only 27 in., so that the loading line can be anything from this figure upwards according to the type of body fitted. A single motor of very robust design drives an overhead worm axle, and a drum controller gives three speeds forward and reverse. All the control gear is mounted on the dashboard within the cab, and is thus very accessible for inspection and adjustment. A battery of 160-Ah capacity gives a road speed of 8 m.p.h. fully loaded on the level and a range of 20 to 25 miles per charge according to the class of road surface. Other exhibits include a 2-ton elevating platform truck which has been designed for use in connection with stillages whereby these are conveniently loaded as required and when ready for movement are packed up by the truck and deposited again wherever necessary. A 2-ton general purpose platform truck, which has a platform of 3 ft. 4 in. wide by 6 ft. long, but for carrying light and bulky articles it can be extended to 8 ft. 9in. by fixing the end gate in a horizontal position in the holes provided for it in the end bumper plate. The standard battery consists of 24 Edison cells of 225-Ah capacity, and this is sufficient for a full day's hard work without the need of a boosting charge. This latter can, however, be given under exceptional circumstances, thus enabling the truck to carry on for still longer periods.

George Ellison.

Conspicuous among the exhibits upon this stand are a new design of fireproof circuit breaker for use in mines, a new cable-way plug and socket connecting point for trailing cables, and an 11,000-V cubicle. The plug and socket equipment is especially designed for use in factories, mines, docks, &c., where a plug connection for portable tools and machines is a great convenience. Its cases are heavy gun-metal castings, turned, screwed and finished in steel bronze. The fixed contact case is provided with a flange for bolting to a flat surface or over the cable entrance of a totally-enclosed circuit breaker, and a screwed cap fits over the fixed contacts when the connector is not in use. A rubber packing ring firmly held on the fixed contact face makes the coupling, or the fixture covered by its cap, proof against dust or weather. A secure grip of the trailing cable is obtained by means of a screwed gun-metal conical clamp and wood bush. The terminal blocks are recessed to receive the cable strands under a clamp and are specially shaped to assist the cable grip without a strain on the binding screws. The special features claimed for it are: (1) the contacts are self-cleaning, self-aligning, spring type, offering no resistance to the effort of inserting the plug, but making forcible union between plug and socket; (2) the terminals are effective clamps for the cable strands, ensuring a good electrical and mechanical joint; (3) the trailing cable is securely gripped by a screw clamp. The plug connector box, illustrated in fig. 8, was designed for installation in an armoured cable run under a jetty, a small hole being provided for inserting the trailing cable plug. It is also suitable for use in connection with cables laid underground. The flame-proof circuit-breaker shown is designed for use in mines, and is made to withstand rough usage. It can be produced with two, three, or four poles, to carry currents up to 150 A. Four automatic releases can be fitted, including no-voltage and overload releases with or without time lag. The gear is effectively

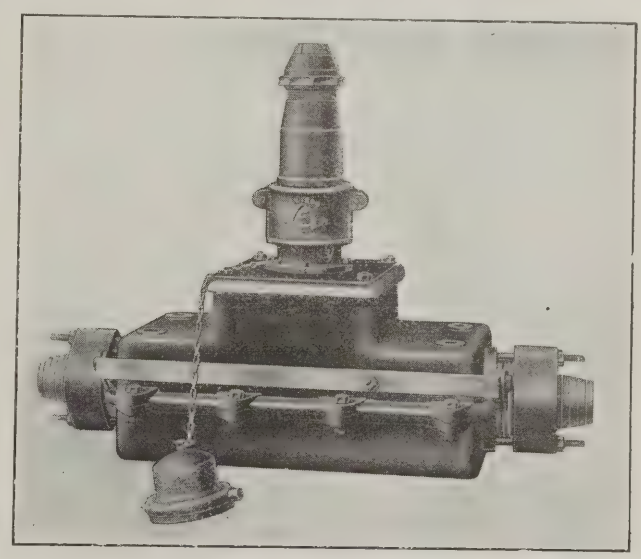

Fig. 8.—A Cable Plug and Socket Box.

interlocked to prevent improper operation or interference. The 11,000-V cubicle shown is a steel construction, access to the gear being gained through hinged doors, which are fitted with padlocks. A unit may contain one or two sets of busbars, pole-operated isolating switches, a hand-operated oil circuit breaker, current and potential transformers, instruments, meters, signal lamps, and interlock contactors. A number of units may be erected together with continuous busbars, to form a switchboard. The breaking capacity is 150,000 kVA at 11,000 V, 3-phase, on a symmetrical short circuit. Other exhibits of this firm are sub-station switchgear, circuit breakers, "Tufnol" (a synthetic-resin insulating material), and a time-lag device for circuit breakers. The last allows the passing of the momentary rush of current upon starting.

W. Canning & Co., Ltd.

A working exhibit of a fully-automatic electro-plating apparatus is exhibited by this old-established company. This not only embodies practically every latest improvement in electro-plating practice, but enables work to be successfully produced without any manual labour beyond hooking the articles on at one end, and taking them off when finished at the other. As the work to be plated has to pass successively through all the preparatory cleaning and swilling vats before going into the depositing vat, and finally through swilling and dipping out apparatus after deposition, careful and accurate design has been very necessary. As will be seen from fig. 9, the various vats are placed in line, one behind the other, in their proper order. Two conveyor chains are arranged to move slowly over this line of vats, supported at intervals by idler pulleys mounted on shafts carried by steel standards on each side of the line of vats. The chains are driven at a slow speed by reduction gear from an electric motor mounted on a steel framework over the rear end of the apparatus. Steel standards are erected at intervals each side of the line of vats, each pair of which carry bearings for a shaft fitted with two chain wheels. This shaft runs just under the line of the conveyor chain and each chain wheel has a chain drive to a similar chain wheel vertically above it, which is mounted on a fixed pin carried by the steel standard. The conveyor chain track and each vertical chain is fitted with a pick-up attachment which lifts the bar out of one pair of holders on the conveyor chain and drops it into the next pair. The transporting gears are operated by a long shaft running down one side of the apparatus, which drives a worm gear on each of the steel standards connected by a chain drive to the lift gear shaft.

Although this description may seem elaborate, in reality the apparatus is exceedingly simple. The details have been carefully thought out so as to eliminate wear and breakdown. Along the length of the plating vat, just outside the track of the conveyor chain, are two angle sections of brass at such a height that the cathode suspender bars slide on them whilst they pass over the vat. These angles are connected to the plating dynamo and form the electrical connection through the suspender bar and suspending hooks to the cathode. The top of the angle bar is broken up into small inclined planes with a step down again at their finish so that the suspender bar gets a jerk every time it drops over the end of one of these planes during its travel. This forms a cathode gas-disturbing device and shakes the gas bubbles from the work being plated. The solution is heated by electrical elements, and an alternative heating system is exhibited for heating by steam coils. A combined agitating and filtration apparatus is fitted by which the solution is continually filtered free from suspended matter and kept in constant movement. The apparatus is operated by a 6-V, 250-A motor-generator for the plating vat, and a 6-V, 150-A motor-generator for the cleaning vat, which is of the electric cleaner type, and a 3-h.p. motor drives the pump for the agitation and filtration apparatus. The apparatus shown is 50 ft. long by just over 4 ft. wide. On the stand the company also exhibits a range of its dynamos, including a 6-V, 1,000-A machine for belt drive, a 2-h.p. motor polisher, and various patterns of polishing lathes for belt driving. Various types of grinding machinery, a small "Minik" plating apparatus, and various other plating accessories are shown.

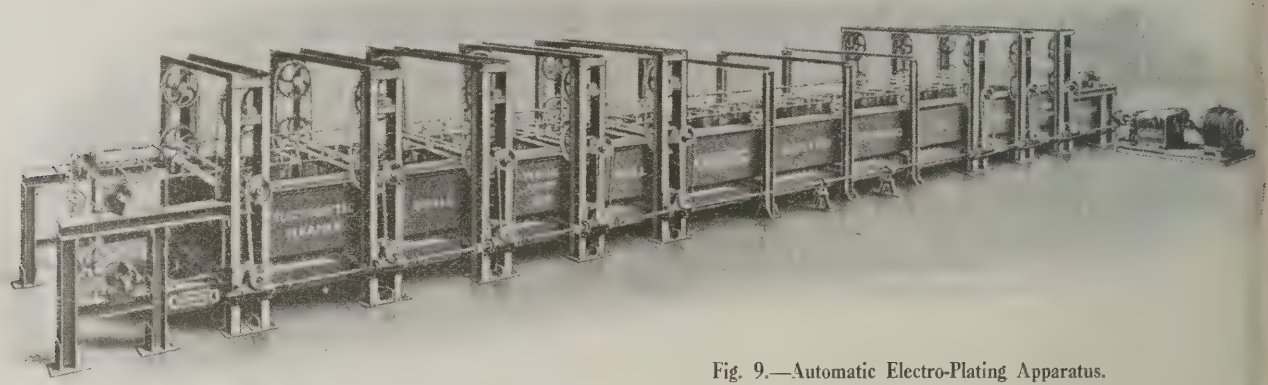

Fig. 9.—Automatic Electro-Plating Apparatus.

Electroflo Meters Co., Ltd.

The stand of this company is in the Steam Power Section, and the exhibit comprises electrically-operated fluid flow meters for the measurement of steam, water, air, oil, and gas. Two additional panels are also located in the section, one on the stand carrying the Lancashire and water-tube boilers, and the other on that carrying the turbo-generator. The first panel is the "Electroflo" standard boiler-control panel, comprising a 15-in. diameter circular dial type boiler load indicator, having 2-in. high numerals and clearly visible pointer, two draught indicators, and one pressure indicator, all circular in shape and 12 in. in diameter, so that they are clearly visible from considerable distances. The draught indicators are calibrated in 0.01 in. w.g., and have a 320 deg. scale. The importance of clear visibility of the reading instruments has been considered, and the dials are either 12 in, or 15 in. in diameter. The boiler control panel is completed with the addition of a 9-in. scale CO_2 indicator. The panel on the turbo-generator exhibit comprises two meters, one measuring the main steam supply to the turbo, and the other the condensate discharge. These meters include an indicator, a recorder, and a 5-dial continuous integrator. The panel is completed with a multi-point distance temperature indicator, complete with totally enclosed multi-point rotary switch. The exhibits on the main stand also comprise distance temperature indicators of the thermo-couple and electrical resistance type, and a multi-point continuous electric temperature recorder. The features of these instruments include straight charts, approximately 7 in. wide, and individual operating systems. The "Duplex" continuous electric temperature recorder has two entirely separate operating systems, so that any two chart records can be used simultaneously. The whole of the actuating mechanism is mounted on a bracket swinging 180 deg. out of the instrument casing. A model of the "Electroflo" meter in section demonstrating its principle of operation is exhibited.

Crossley Bros., Ltd.

This exhibit includes two "Crossley" standard types of crude oil engines representing the horizontal 4-stroke and also the vertical 2-stroke. In addition, a 1½-kW lighting set is shown; all engines can be seen in operation. The horizontal oil engine is of the cold starting type developing 32 b.h.p. as a working load, and using as fuel the cheapest grades of residual (crude) oil, in addition to standard grades of Diesel and gas oils. The fuel oil is supplied on the solid injection principle, the fuel pump being of the vertical type with double suction and delivery valves, and is operated from a cam on the sideshaft. The governor regulates the exact quantity of fuel oil admitted each power stroke by means of a control valve, and ensures that the fuel always enters the cylinder when the heat of compression is at its maximum. The Crossley vertical 2-stroke oil engine has a capacity of 14 b.h.p. working load. This engine also uses residual (crude) oil, Diesel oil, or gas oil. A special feature on the engine consists of a separate air scavenging system obtained from a low pressure air pump driven from the crankshaft. Forced lubrication is fitted throughout to all bearings and main moving parts. The Crossley lighting set consists of a 1½-kW, 50/70-V, belt-driven dynamo, coupled to a 3-b.h.p. engine, the whole being mounted on a substantial underbase. A separate wall mounted type switchboard is included. The engine is of the horizontal totally-enclosed type, with a continuous system of automatic lubrication, whereby the set will operate all day without attention, the fuel used being paraffin.

W. & T. Avery, Ltd.

This company is displaying a very comprehensive display of types of weighing machines, counting machines, testing machines, and so on. Readers will no doubt find their interest chiefly engaged here on the machines for testing specimens representative of a bulk of material and for carrying out hardness tests. Other noticeable machines will be those that count as well as weigh to a fine degree of accuracy.

Birmingham Corporation Electric Supply Department.

The principal exhibit of this department is a complete mercury-arc rectifier sub-station of 460-kW capacity, including two 138-kW booster rectifier equipments, as used in outlying areas to convert 5,000-V, 25-cycle a.c. (three-phase) to d.c. at 220 and 440 V for distribution. Another type of sub-station is an example of the equipment installed in large consumers' premises. It consists of three 100-kW transformers for reducing the pressure of the three-phase, 25-cycle supply from 5,000 to 230/415 V. In conjunction with Automatic & Electric Furnaces, Ltd., the department is showing a number of electric furnaces ranging in size from 7.2 to 21 kW, for a number of purposes and industries, including tool-hardening, carburising, annealing, enamelling, &c. Another section of the stand is devoted to welding plant, and three types are shown, *viz.*, a 3-kW butt welder, an 8-kW spot welder, and a 15-kW flash welder. In addition to these there is a large collection of all kinds of industrial appliances, including an automatic coil winder, an electromagnetic separator, a magnetic pulley, a

foundry riddle, portable electric tools, "Ozonair" air-purifying apparatus, "Morganite" factory-type heating units, &c. A wide range of domestic appliances is also shown; this includes a 4-kW coffee boiler, fires, irons, kettles, &c.

Wingrove & Rogers, Ltd.

Among the exhibits of this company is its newest product, the "Super Giant" sprung truck of the battery propelled type. This is designed to give efficient service under the roughest conditions. The drive is from the motor by means of a cardan shaft, through a worm and worm wheels, on to a differential of the fully floating type; the differential is fitted with roller bearings, all shaft ends being splined. The truck is rated at 5,000 lb., and is mounted on semi-elliptic springs, the battery being additionally sprung by means of eight helical springs suspending from the main frame. In this manner the battery is completely protected against bumps or jars. The truck is fitted with a specially designed controller, which is arranged to give three speeds in either direction and is electrically interlocked with the brakes, this rendering the truck fool-proof. Amongst the other exhibits are the "Midget Whippet" elevating truck and the company's No. 2 size locomotive. The principal feature of the elevating truck is the very handy manner in which it can be manœuvred, its turning radius being only 3 ft. to the centre of the truck, and it will turn out of a gangway 4 ft. wide into one of similar width. It is fitted with hand-operated elevating gear. The No. 2 locomotive has a hauling capacity of 10 tons. It has a cast-iron frame, the motor being situated under the driver's platform. The drive is of the spur gear type on to all four driving wheels, and efficient braking is provided upon all four wheels.

Credenda Conduits Co., Ltd.

On this stand, which is among the larger ones, is a very complete range of "Creda" electric heating and cooking apparatus produced at the company's new works at Oldbury,

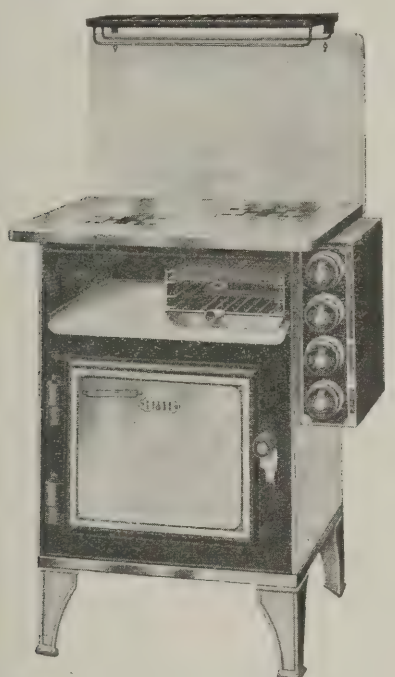

Fig. 10.—A New "Creda" Cooker.

which were described in our issue of January 14th. Six different types of cookers are shown, from the "Bijou" model suitable for two people, up to a large range capable of cooking for 18 persons. The latest model is the "C.35," illustrated in fig. 10. This has a total loading of 6,300 W, made up as follows:—Oven, 1,800 W; two boiling plates (7 in. square), 1,500 W each; and grill, 1,500 W. The control apparatus is conveniently mounted at the side, and includes rotary snap switches. This cooker is designed for catering for from four to seven persons. In addition to the cookers, the company displays a large number of fires, irons, kettles, wash boilers, and other domestic appliances. One section of the stand is devoted to conduit and conduit fittings. Daily demonstrations of electric cooking are given.

W. H. Allen, Sons & Co., Ltd.

The principal item of interest upon this stand is a 250-kW geared turbo-generator set designed for back pressure. The turbine is of the impulse type, running at 6,000 r.p.m., driving a shunt-wound 110-V dynamo through double helical reduction gearing at a speed of 650 r.p.m. The set is constructed for a steam pressure of 210 lb. per sq. in., 590 deg. F. total temperature, exhausting against a back pressure of 20 lb. per sq. in. With the set are samples of turbine blading and a complete wheel. Another generating set shown comprises a two-crank compound enclosed force-lubrication engine direct coupled to a 100-kW d.c. dynamo, running at 500 r.p.m., mounted on a combined baseplate. This engine is designed for operation on a steam pressure of from 125 to 200 lb. per sq. in. exhausting against a back pressure of from 0 to 5 lb. gauge or 105-200 lb. per sq. in. dry saturated, exhausting with condenser. These two sets are suitable for works requiring steam for processes as well as electrical power. The company's oil engines are represented by a 50-b.h.p. heavy fuel oil engine designed to give its output at 375 r.p.m. It is of the vertical, two-cylinder type. A model of a 35,000-sq. ft. condenser is shown; the company has since produced condensers with a surface of 45,000 sq. ft. The pump gear exhibited includes a belt-driven "Conqueror" centrifugal pump with an output varying from 250 to 800 gal. per min. against heads of from 10 to 50 ft., the speed ranging from 640 to 1,140 r.p.m.; a model bore-hole pump; and a high-lift pump impeller and guide ring. A collection of photographs of the company's products completes the exhibit.

Rapid Magnetting Machine Co., Ltd.

This exhibit consists of electric lifting magnet equipment and magnetic separators. Three different types of the latter are shown, all of which are obtainable in different sizes. The windings in each type consist of solid metal formers insulated with fireproof material, impregnated with non-hygroscopic insulation varnish, and wound with fireprooof insulated high-conductivity copper wire or strip. These formers fit into suitable recesses in the machined castings, and in all cases renewable lifting poles having recesses for protecting the bolts are fitted. Finally, intervening spaces between the coil units and the shells are filled with insulating compound which facilitates radiation and increases the insulation resistance to earth. The mechanical construction is robust in design, and the connection boxes are fitted with spring cable protectors, the glands being watertight. Amongst the electro-magnetic separators, the "B.B." type claims attention. It consists of a framework, suspended from which is an highly-intense magnetic separator trough. A series of magnet bars stretches across the trough at right angles to the direction of flow of the material being treated; the trough, suspended on machine brackets and pins, is jig shaken by means of machined totally-enclosed dust-proof pattern ball bearing eccentrics at about 250 oscillations per minute.

Paterson Engineering Co., Ltd.

In the Model Boiler House this company shows a lime-soda water-softening plant for the treatment of boiler feed supply, having a capacity of 1,500 gal. per hour. The plant is in operation under working conditions, and is fitted with osilameter measuring and chemical supply gear, wood fibre strainers, and sludge settling arrangements. There is also displayed a model of the by-pass type osilameter measuring and chemical supply gear for the addition of lime and soda ash as installed in connection with large water-softening plants of 5,000 to 100,000 gal. per hour capacity. An interesting exhibit is the "Basex" base-exchange water softener for producing a water of zero hardness. The "Basex" softening material used in this plant possesses the characteristics of a natural base-exchange material, and is a natural earth product suitably treated to enhance its sensitivity and stability. Upon its stand next to the Boiler House the company exhibits a pressure filter as installed for the purification of sedimentary waters for boiler feed supply and manufacturing purposes. This is exactly similar to the filters used for the purification of drinking water supplies at Bradford. Another exhibit is the Paterson "Chloronome," for the continuous sterilisation of drinking water supplies.

Bulpitt & Sons, Ltd.

This company is again showing its range of electric cooking utensils. These are constructed on the immersion heater principle, which, besides giving rapid boiling, permits instant replacement. A wide range of articles is exhibited, extending to coffee percolators, kettles, egg steamers, irons, double saucepans, and steam cookers, and all the items exhibited can also be made in aluminium. A novel form of safety device is arranged to throw off the connector when overheating occurs, and this device gives a rapid break, besides furnishing visible evidence of having operated. A recent improvement is the disposal of the spare safety capsule in a recess in the handle of the kettle. On this stand is also to be seen a range of d.c. and a.c. motors, sold under the trade name of "B.K.B." Messrs. Bulpitt form part of the B.K.B. combination, and make part of the range at their Birmingham works. There is a "B.K.B." motor for driving many classes of machines, their range extending from 0.01 to 7.5 h.p. Exhibited on the stand are models of the a.c. patterns, but in addition to the ordinary 2- and 3-phase induction type, the company exhibits its repulsion induction motor and split-phase induction motor, both for single-phase. Another exhibit is a range of d.c. battery chargers, two sizes of which are intended for home use for re-charging radio and automobile accumulators.

Sturge & Baker, Ltd.

As usual, this Birmingham company shows a full range of its "Red Rose" electric fires and small heating apparatus. These are made in five sizes, and they can all be used for toasting, boiling, frying, &c., as well as for general heating. They can be wound for any of the ordinary voltages, a.c. or d.c., and the heat rays can be directed in any direction by tilting the copper reflector. Another interesting exhibit is the "Vesper" electric fire screen. This is in appearance

an attractively-designed screen for the ordinary coal fire-grate, and can be used as such during the warmer months, when a fire is not required. It contains in the centre, however, an electric fire which can be covered by a shield when not in use. It is made in various styles and sizes, including antique copper and oxydised silver finishes. Messrs. Sturge and Baker also show their spring reels and balls for coiling up slack flex and cable.

Westminster Tool and Electric Co., Ltd.

This company shows standard sizes of electric portable drills ranging in capacity from ¼-in. to 2-in. holes in mild steel, the No. 2a pattern, which is shown, representing a reduction of 22 lb. in weight as compared with ordinary drills of the same capacity, of 11 in. in overall length, and an increase of 3½ in. in length of feed. All the drills are "universal" wound, *i.e.*, they can be used on either direct- or single-phase alternating-current circuits. Two features of the small centre grinder, which are shown, are the special micrometer adjustment of the shaft and the careful balancing of the armature. The portable blowers exhibited are of value in keeping motor windings clean and for similar purposes. Several interesting examples of magnetic and other drilling stands are shown in use. Commutators of various sizes are also on view, as are samples of meter, solenoid, and switch-control coils. In conjunction with the Flexible Shaft Manufacturing Co., the Westminster Company shows long flexible shafts applied to its tools.

Electric Fires, Ltd.

Exhibited on this stand is a range of "Heatrae" electric fires, which are designed as an imitation of the old-fashioned blazing coal fire. Included in the range is the "Columbine," which is suitable for fitting in the standard coal fireplace. Samples of "Heatrae" portable electric fires are also shown, some of which embody the "Heatrae" plug-in type fire bar. These fire bars are backed by reflectors, which project the heat forward and downward as required. Practical demonstrations of the fires are given. Other "Heatrae" apparatus exhibited includes electric water heaters, low-temperature air warmers, low-temperature air tubes, water urns and glue kettles, immersion heaters, towel rails, hot plates, griller-boilers, breakfast cookers, glossing or treeing irons for the boot and shoe trade, and the "Heatrae" housewife cooker, which is designed with a view to convenience and safety for export.

Beatty Bros., Ltd.

This company exhibits its two principal products, the "Beatty" and the "White Cap" electric washers, the former being a new model. It can be worked from either a.c. or d.c. mains, the power being derived from a ½-h.p. motor situated at the base of the machine. The agitator—the revolving wheel in the tub itself—turns 106 times a minute, and this is claimed to be faster than any other make on the market. The driving gears are mounted in a solid iron bed plate, are double cut, with wide faces, and run in oil. A wringer that can be electrically operated is attached; this can be removed when desired. The "White Cap" is built along much the same lines, except that the base and general framework are of wood instead of metal, and that the agitator is situated in the top of the tub and not the bottom.

Davidson & Co., Ltd.

In connection with the model boiler-house plant in the Steam Power Section, this company is showing one of its patent flue dust collectors, which remove from the flue gases not only the particles of grit, but dust so fine that it will pass through a 200-mesh screen. On an adjacent stand the company is showing a working model of this collector, as well as a representative selection of "Sirocco" fans, one of the fans being completely dismantled, affording the visitor an opportunity of inspecting it in detail. A small collector for dealing with industrial dust in a factory is also shown in operation. This collector is not only suitable for catching wood refuse and dust from grinders, but on account of its high collecting efficiency is also extensively employed for retrieving valuable dust produced in manufacturing processes.

Hollings & Guest, Ltd.

This company is exhibiting some of its hydraulic and other machinery, &c. Of interest is the vertical four-column press with steam-heated platen, specially designed for the manufacture of insulating materials. This is fitted with two hot plates, made of cast iron, in which the steam-heating coil is cast solid in the plate, making it practically impossible for a fracture to occur at any steam pressure. The top plate is firmly fixed to the press head, and the bottom plate is attached to the press table. The table is suitably insulated from the bottom hot plate, so as to prevent the hydraulic packing from being damaged. Other exhibits include hydraulic valves and fittings, hand-bundling presses, a light metal-bundling press, and a selection of "Ellmar" moulded pressings.

Birkbys, Ltd.

"Elo" synthetic resin products are shown by this company, comprising mouldings, moulding powders, insulating varnish and resin. "Elo" is suitable for electrical work, scientific instruments, and also for mechanical applications. It does not soften in heat, retains its shape and form under all normal conditions, is unaffected by damp, and can be moulded to very fine limits of accuracy. Metal inserts can be firmly moulded into position during manufacture if required, and within certain broad limits it can be drilled and tapped. It has a specific gravity of 1.33 to 2.0, a dielectric strength of 30,000 to 40,000 volts a.c. for ⅛ in. thickness, and a tensile strength of from 4,000 to 5,000 lb. per square inch.

Santon, Ltd.

The usual range of "Santon" electric geysers and switching plugs is shown. A three-phase geyser dealing with a loading of 12/15 kW is actually demonstrated. Another exhibit is the "Santon" heater belt. This is a flexible aluminium belt with an asbestos-lined cover, 1½ in. wide of varying lengths, which can be slipped around any existing hot-water tank and connected to the bathroom heating plug. It provides a simple means of supplying hot water, and cuts out the necessity for installing expensive storage systems. It is supplied with three loadings, viz , 500, 750, and 1,000 W.

Shropshire, &c., Power Co.

The Shropshire, Worcestershire & Staffordshire Electric Power Co. is represented by an Information Bureau which is designed upon pleasing lines. It is exhibiting a fine relief map for the area served, on which are clearly indicated main transmission and distribution lines. Another feature of interest is a collection of photographic enlargements which display to the manufacturer at a glance the advantages of the company's area in respect of transport by rail, canal, and river, and direct communication with the Bristol Channel.

Damard Lacquer Co., Ltd.

This company, which specialises in bakelite and lacquer products, is exhibiting chiefly "Formite" bakelite synthetic resin for the manufacture of insulating and other varnishes and enamels, and also mixtures for producing such articles as moulded radio components, fancy articles and the like. Other exhibits include insulating varnish, adhesive cement, ornamental "C" material, specimens of finished articles from the above materials, and specimens of metal work coated with various lacquers.

Ebonestos Insulators, Ltd.

The principal exhibit on this stand is a number of bakelite mouldings and "E.I.L." lampholders. Of interest, too, are the h. and l.p. line insulators for power transmission, telegraph and telephone lines. A noticeable feature of the stand is the erection of three sections of telegraph poles above the top of the stand, showing the actual application of "E.I.L." insulators.

W. & C. Pantin.

This exhibit is of interest chiefly to the principals of large manufacturing works and shipping houses. It consists of a vertical swing tray elevator for raising boxes, a gravity roller conveyor for carrying them, and a patent inclined belt lowering apparatus for lowering them. The vertical swing tray elevator is fitted with a patent automatic loading device for raising the boxes automatically from the gravity roller conveyor at the bottom.

Antrobus & Co.

This firm exhibits electric lighting fittings, including 3-light electroliers, pendants, bowls, wood and metal table standards, wall brackets and hall lanterns, amongst which is an entirely new design of pendant in which the band, chain and ceiling plate are made of polished Jacobean oak; a silk shade is fitted.

The "Petosign" Co.

This company is displaying an advertisement projecting machine for shop windows, showrooms, and exhibitions. This machine projects lantern slides, which change every five seconds, on to a ground glass screen embodied in the construction of the machine.

Richard Johnson, Clapham & Morris, Ltd.

In addition to various types of copper wire, this company is showing miners' safety lamps, wire lattice for road reinforcement, woven wire, wirework of various patterns, and two types of reinforcement.

J. B. Stone & Co., Ltd.

This company is exhibiting two of its "nibbling" machines for nibbling steel plate up to 5/16 in. thick. Both are entirely new and improved models, embodying many new features.

Earle, Bourne & Co., Ltd.

This company shows cold rolled brass and copper in strips and sheets, solid drawn and brazed brass and copper tubes, locomotive and condenser tubes, and a wide selection of sections and angles.

A. Morton, Ltd.

A comprehensive range of small capstan, automatic, and turned parts for the electrical and allied trades is shown by this company, which specialises in making parts to customers' requirements.

E. H. Millington & Co., Ltd.

Electrical shop signs for both inside and outside lighting are displayed on this stand.

THE LONDON SECTION.

S. G. Brown, Ltd.

There can be only one gyro compass exhibited at the Fair, because the "Brown" is the sole British representative in this specialised branch of engineering skill. Its sea performance is proved by the fact that the owners of the new *Ile de France*, 40,000 tons, the largest vessel constructed since pre-war days, have given preference to it. The workmanship throughout is of high quality. The electro-megaphone is a loud-speaker telephone for ships, railways, workshops, mines, and other places where noise is a disturbing element. The transmitted voice can be heard 100 ft. from the receiver, and the outfit is of robust and simple construction, no valves being used. To meet the needs of those who desire to purchase a broadcast radio-telephone receiver complete, the firm is showing for the first time the "Ideal" set, which includes everything that is required, together with a 21-in. loud-speaker. The set is suitable for use with an indoor aerial within a radius of six miles from a local station and 15 miles from Daventry. In addition, the new "Sphinx" loud-speaker is being placed on the market for the first time, and the company's usual range of speakers, headphones, crystal amplifiers, gramophone attachments, &c., is too well-known to require further comment.

Vulco Dry Battery Co., Ltd.

Amongst the high-voltage batteries for wireless purposes displayed are a "treble-capacity" type and also grid-bias cells. Batteries for general use are made in three grades, designed for heavy, medium, and light work; they are all made in a London factory.

Beard & Fitch, Ltd.

In this display of radio components special attention is directed to the "Success Super III" receiver, which incorporates an oxydised-silver metal panel and cabinet to match of handsome appearance. It is a 3-valve set with single-filament control and tunable between 40 and 2,500 metres, the S.L.F. condensers having a 100 to 1 ratio slow motion. Specimens of gearing are also on view.

London Radio Manufacturing Co., Ltd.

The company specialises in the design and construction of sound-reproducing instruments, and is demonstrating "Orphean" loud-speakers. Those on view include the standard model for ordinary home entertainment purposes and the De Luxe model with moulded bakelite base: both of these models are horn-type instruments. Gramophone attachments are also on view, and the "Oriel" cabinet speaker for use in the drawing or music room.

Ogilvy & Co.

The company manufactures microscopes, optical projection instruments, and medical and dental illuminating apparatus. For microscopical illumination a special "Opalite" lamp bulb of the half-watt type is available: made of a mixture of glass which presents an exceedingly fine opal surface, the filament is entirely obscured and the rays diffused, so that when the surface of the bulb is sharply focused in the plane of the object no structure or granular matter is observable in the field of view. An axial illuminator is also available.

British Electrical Sales Organisation.

"Beco" hornless loud-speakers are to be seen on this stand in various metal finishes and wood cabinets. One pattern has the unusual form of a rose bowl, and it is declared that filling the bowl with water and flowers does not impair the function of the device as a speaker.

British General Manufacturing Co., Ltd.

Broadcast radio apparatus known as "Britimax" includes 2- and 3-valve receivers built into cabinets of pleasing design, with compartments for storing batteries, and all wires are hidden from view. The sets are transformer-coupled and constructed for a wave-hand of from 250 to 2,000 metres, without the need for changing coils, by the incorporation of an aerial-tuning unit, which consists of a straight-wound 10-tapped inductance with stud-switch fitted in order to select the required wave-length. The reaction coil is mounted in one end of the unit, which is designed to work in conjunction with a .0005μF condenser in parallel; to change from the local station to Daventry all one needs to do is to turn the top knob to the required stud and finally tune on the condenser.

Brilliant Sign Co., Ltd.

Illuminated signs in a great variety of styles are made by this company, electric flashing devices and time switches being a speciality; also recessed faced metal letters now so largely used for changing signs. The "Internalite" day and night sign has a design, lettering, &c., etched on polished plate glass in colour, and the illumination, provided by tubular electric lamps in the framework, is transmitted through the substance of the glass; single side signs are transparent, and do not obscure the background.

Formo Co.

This firm's wireless products are too well known to need any introduction; they are well made, the shrouded l.f. transformer being wound with 12,500 turns of wire on a Stalloy laminated core. The choke-capacity coupler has an iron core wire wound and incorporated with resistance and capacity elements, the whole being very compact. Screened coils, low-loss couplers, and heterodyne oscillators are also on view, and the straight-line frequency condenser shown has a 16 to 1 dial reduction gear enclosed in a bakelite cover which is provided with a window and fine hair line for accurate adjustment; cone bearings are used which wear concentrically, thus tending to preserve alignment.

Portable Utilities Co., Ltd.

The "Eureka" radio products shown on this stand include coils, aerial couplers, h.f. and l.f. transformers, chokes incorporating grid-leak and condenser, and ortho-cyclic condensers, each degree on the dial covering exactly 10 kilocycles, it is claimed. The large l.f. transformer is claimed to be hermetically enclosed in a coppered steel case and proof against atmospheric influence. The h.f. model is formed of two ebonite tubes, the inner one carrying the primary winding, and on the outer ribbed tube is wound the secondary coil with ample air spacing.

Electro-Magnetic Blanket Co., Ltd.

As its name implies, this company is showing electrically-heated blankets and pads for local application. The latter have a heavy copper coil at their centre, while the "Radiocoil" blanket is constructed by winding 12 strands of copper wire round a cord which is sewn in two parallel rows in two sections down the whole length of the blanket.

Artistic Shade Co.

This stand illustrates the progress that has been made during the last few years in interior lighting. The company claims to be one of the originators of the new decorative lighting movement, and is showing about 200 of its latest models. Every shade, and every part of the shade (shape, design, colour, trimming) is said to be designed by an artist, and buyers will find every type from which to choose, from the simplest to the most elaborate. Architects in particular will be interested in a series of hand-painted designs for schemes of decorative lighting carried out by this firm in various parts of the country.

Tungstone Accumulator Co., Ltd.

In addition to a full range of lighting and starting models for motor-cars, lorries, and public-service vehicles, 3 (actual) ampere-hour high-voltage wireless batteries at voltages of from 24 to 96 are exhibited. "Caxton" wireless cabinets also form part of the exhibit.

Mr. Harold Ashton.

On this stand spreaders are to be seen for constructing cage aerials. They are made of galvanised metal, circular in shape, 18 in. diameter, with nine spokes carrying nine china insulator bobbins; two spreaders are fixed on one pole any distance apart, according to the length of aerial required, and the aerial wire is wound on the insulators, between the spreaders, starting on the top spreader and finishing on the bottom spreader, the lead-in wire being taken from the last insulator on the bottom spreader. Any kind of wire may be used and any type of pole, which the spreaders are made to fit, the fixing clips in the centre of the spreader being adjustable. The Ashton aerial is also made in a portable form, similar to an umbrella when closed.

Halcyon Wireless Supply Co., Ltd.

The company specialises entirely in portable receivers, and three-, four-, and five-valve receivers are exhibited in both oak and mahogany cabinets. The five-valve receivers are guaranteed to give loud-speaker reception anywhere in England without external connections. Although a "straight" circuit, the makers are prepared to guarantee loud-speaker reception in London of the London, Daventry, Paris and Berlin stations. In addition, the Company is showing for the first time a new seven-valve portable super-heterodyne set in an exceedingly compact form, and all valves and batteries, as well as an "Amplion" loud-speaker, are enclosed in the cabinet.

R. F. Graham & Co.

The "Norbex" wireless accessories shown include crystal detectors, eight types of valve socket, plugs, &c., made of brass and nickel plated.

J. J. Eastick & Sons.

This exhibit of a large variety of radio accessories includes many patterns of plugs and sockets, connectors, adaptors, &c. Interchangeability is a standard feature, and freedom from error is guarded against by the selection of six distinct colours for the insulating sleeves of the plugs with corresponding indicating rings on the sockets.

The Stability of A.C. Systems.

Synchronous machines can be made sufficiently stable for all usual power supply purposes; the power limit and voltage regulation of transmission circuits depend principally on their series reactance.

By F. H. CLOUGH, C.B.E., M.I.E.E.

(*Abstract of Paper read before the* INSTITUTION OF ELECTRICAL ENGINEERS.)

THE stability of a system may be defined as its ability to respond to the power demands for which it was designed, and it is very closely associated with voltage regulation. When power is transmitted over long distances, stability needs very careful investigation. Although transmission and distribution circuits in this country are usually sufficiently stable, being comparatively short, we are probably nearer to the instability point on large synchronous machines than is generally realised. To show more clearly what is meant, assume that a sub-station or distribution point is fed over a line containing considerable reactance; the power factor of the load at the sub-station is assumed to be 0.8, and the reactance in the feeder 100 per cent., *i.e.*, the reactance is equal to the impedance of the load under full-load conditions. In order to give normal voltage at the sub-station at full load, the voltage at the supply point must be 79 per cent. higher than at the sub-station: if the voltage at the supply point remains constant at 179, and if the load is varied in magnitude, but always with a power factor of 0.8, then the sub-station voltage will vary according to the curve ABC (fig. 1), where the voltage is given in relation to the current flowing. By plotting the product of current and voltage corresponding to it, a power curve DBC is obtained which attains maximum value at normal full-load conditions. The power factor at the sending end would be 0.446, and a machine of 179 kVA would be required to give 100 kVA at the sub-station. On the assumption of normal voltage at the sub-station at full load, the voltage at the sending end will depend on the power factor of the load; for unity power factor 141 volts would be necessary, and for 0.8 leading power factor 89 volts. In all cases, however, the maximum power limit would have the same value, and would occur at full load; fig. 2 gives the curves for unity, and fig. 3 for 0.8 leading p.f. If the load at the sub-station consists of induction motors, such a system would be unstable—for if the motors are called upon to supply additional load, they will respond by taking more current, so that the voltage will rapidly fall off and the motors will come to a standstill. If synchronous motors were installed, the system would be equally unstable if the power factor remained at the original value, but synchronous motors can be made to supply leading current to change the power factor, and the power limit can be raised. Instability does not necessarily occur at the point of maximum power; generally, the natural limit for power stability of a circuit is reached when the external reactance is about 100 per cent.; or, in the case of a transmission line, maximum power will be transmitted when the impedance of the load is approximately equal to the reactance of the line.

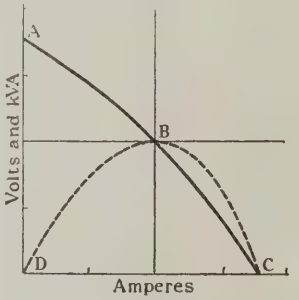

Fig. 1.

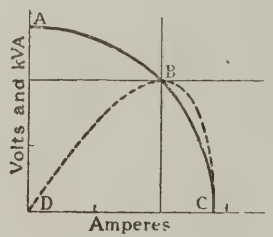

Fig. 2.

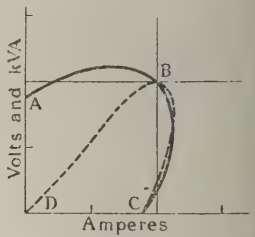

Fig. 3.

When the reactance of a line is high, a large amount of reactive kVA is required to send the current over it: if this is supplied by the generators at the sending end these machines will be unduly large and will operate at low power factor, and the voltage at the sending end will be very high. It is preferable to subdivide the total reactive kVA, placing some at the receiving end in the form of synchronous condensers, as by so doing the power factor of the line can be raised, the voltage at the sending end reduced, and the voltage at the receiving end held approximately constant. The stability of the machines can be used also to raise the stability of the system. In certain cases synchronous condensers are connected to intermediate points along the line; this makes a long line equivalent to several short ones in series. The presence of considerable capacity currents in high-voltage lines helps to improve the power factor and reduce the amount of reactive kVA supplied by the synchronous machines.

In the present state of the art, where large powers have to be transmitted over long distances, it would seem desirable to split up the line into a series of shorter lines, or else to generate and transmit at low frequency and convert to normal frequency by means of motor-generators at the receiving end. With low frequency the reactance could be made low enough to give the necessary stability, and as the voltage could be varied for varying loads the maximum use could be made of the capacity current to give unity power factor and reduce the size of the synchronous machines.

Artificial stability is not necessarily inferior to natural stability—the terms are only used in a distinguishing sense. Cases of instability, where alternators are supplying an induction-motor load, have occurred, and sometimes such cases are rather difficult to understand, because the motors will trip off the circuit due to the voltage falling, and, as soon as they have tripped off, the voltage will again be restored. In an alternator the excitation corresponds to the voltage at the source of supply, and the synchronous reactance to the reactance of a feeder. This "feeder" is highly inductive, but both ends are near together, so that a regulator can be connected to the receiving end (the machine terminals) to control the voltages at the source of supply (the exciter). By this means artificial stability can be obtained. In fig. 4 the curves of an alternator controlled by a regulator are also shown.

If a machine operating at normal voltage is suddenly short-circuited, the current momentarily rises to a value several times normal, and at the same time the exciting current rises to a high value by induction. An explanation would be that there is a hypothetical internal voltage in the machine, which is proportional to the increased excitation, and that the current is equal to this voltage divided by the total synchronous impedance of the machine. This increase in excitation occurs partly in the exciting winding and partly as currents in the heavy damping windings and solid metal parts of the rotor. This phenomenon means that such a machine has two limits of stability, one for gradually applied loads which gives a low value of stability, and the other, a much higher limit, which occurs when the load is suddenly applied, for instance, when the machine is short-circuited. Under actual service conditions the stability will fall somewhere between these two limits.

The turbo-alternator should have two automatic governors, one operated by change of speed to control the power of the turbine, and the other operated by change in voltage to control the excitation of the alternator: the former controls the energy component of the current, and the latter the inductive component; both should operate so that the alternator is able to deliver both load and wattless currents up to any demands within the limit of the capacity of the machine. The mechanical rotating parts of a turbo-alternator set have a considerable amount of momentum, or stored energy, usually amounting to about 6 or 10 kW-seconds per kW of rating of the set. This corresponds to a mechanical time-constant of about 3 to 5 seconds, which means that during any period when the load is changing, mechanical energy may be borrowed from the rotating masses to make up any excess or deficit in the supply of steam energy, and as the time-constant is reasonably long there is considerable time available for the governor to act and the steam supply to be adjusted to the new conditions. In an alternator similar conditions exist, as there is in the rotor a considerable amount of magnetic energy which will supply excitation whilst the voltage regulator is adjusting

the exciter to the new conditions of load. The stored magnetic energy has a value of about 4 or 5 kW-seconds per kW of exciter rating, or time-constant of 2 to 2½ seconds.

During normal operation the armature reaction of the stator tends to suppress the flux, and the exciting current tends to maintain it. If there is a sudden increase in the load, additional currents are induced in the exciting windings and also in the damping windings of the rotor: they flow in opposition to the stator currents and tend to oppose any change of flux during the changing period. The increase in magnetic energy associated with any increase in rotor current is taken from the mechanical energy of the rotating masses.

The rate at which the flux ultimately changes depends on the losses caused by currents flowing in the rotor copper. Due to the large amount of copper in the rotor, these losses are low, and current can be sustained for an appreciable period by the magnetic energy of the rotor. The magnetism of the field acts as a link in the conversion from mechanical to electrical energy, and the stored magnetic energy acts as a reservoir for maintaining excitation during changes of load.

The design of regulator and exciter should be such that the excitation can be corrected to the new value required during the time available: usually most suitable is the vibrating type, which intermittently short-circuits a portion of the field rheostat of the exciter, so that it responds very quickly to changes of voltage. The exciter must also be made to respond quickly to the control of the regulator; this means that the field spools must be made with low time-constants, and that it is preferable to use a separate source of power for exciting the field spools of the exciter, preferably a small auxiliary machine with a highly saturated magnetic circuit incorporated in the same frame with the main exciter.

The use of a separate source of supply for the exciter fields is highly desirable for another reason, as by this means instability of the exciter is avoided. In large machines main field rheostats are undesirable for several reasons, and therefore the exciter must work over a wide range of voltage. If made self-exciting, its voltage is liable to be indefinite, and the exciter to become unstable at low voltages; this difficulty is removed by using a separate source of excitation.

Suitably designed alternators can be made sufficiently stable, so that they can be regarded as fixed points when considering the primary voltage distribution of a system. The capability of transmission lines and feeders of supplying power to, and maintaining voltage at, distant points of a system has also been touched on. The transformer sub-stations fed from the primary system can be considered as fixed voltage points for the voltage distribution of the lower-power, lower-voltage secondary feeders; and similarly for the tertiary and quaternary systems if used. In the primary system the generator reactance limits the maximum fault current, and in the subsidiary system the reactance of the step-down transformers fulfils a similar duty. Any additional reactance in the feeders reduces their value as conveyors of power and should be kept as low as possible.

The maximum fault current in a circuit should have some reasonable relation to the normal current carried. This means that a small feeder should not be connected to a high-power bus-bar, and a main trunk feeder should not be tapped to give a small power supply. The main primary trunk feeders should be used only to convey large blocks of power, and, in order to give maximum reliability and reduce the cost of high-power switchgear, they should be few in number and have a minimum number of tappings. Present practice indicates a limit for the fault current in any part of a large system to that corresponding to about 500,000 kVA. In a large system it may not be possible to get down to this value without using so much reactance that the voltage regulation is too poor, or the system tends to become unstable. In such cases the system should be split into groups which, however, will be connected together by means of the lines containing considerable reactance.

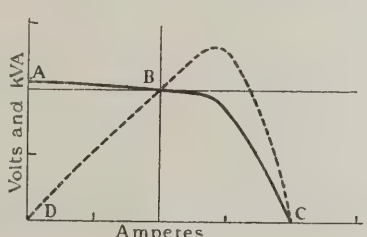

Fig. 4.

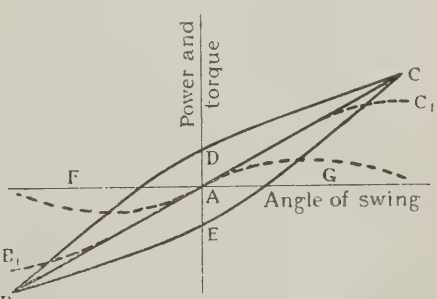

Fig. 5.

A tie line between power stations is usually put in with a definite intention of supplying power in one direction. If the reactive kVA of the line and load is supplied by the generators at the sending end, then their voltage must be raised to deal with the line drop. If, however, synchronous condensers are installed at the receiving end of sufficient capacity to supply the reactive kVA of the load and part of the line, there will be very little line drop. In the latter case voltage control at the receiving end can be effected by adjusting the capacity current of the synchronous condensers, provided that the voltage at the sending end is kept high enough to give stability.

In certain cases it may be necessary to transfer power in either direction over a tie line. If there is sufficient reactive capacity at both ends, then the direction and amount of the energy flow can be controlled by adjusting the governors of the prime movers, and the proper voltage can be controlled by adjusting the excitation of the synchronous machines. In practice there will usually be more synchronous machinery available at one end than at the other, and consequently it may be necessary to use taps on the transformers to get the right adjustment of power flow and voltage. It will probably be a convenience if tap-changing can be done under load.

To illustrate these conditions, assume a 75-mile, 50,000-kVA, 132,000-volt line: at 50 cycles the line reactance would be about 30 per cent. If no synchronous condensers were used the generators at the sending end would have to be rated at approximately 60,000 kVA at 0.67 power factor, and the voltage-drop over the line and transformers would be about 25 per cent. If synchronous condensers were installed, their rating would be about 40,000 kVA, but the generators would be only about 40,000 kVA and could operate at approximately unity power factor. The synchronous-condenser arrangement is more costly than the other, as a total plant capacity of 80,000 kVA in two machines is needed, instead of 60,000 kVA in one: there is, however, a saving in the size of transformers.

The power limit of the line will depend primarily upon the total reactance, which should preferably not exceed about 50 per cent.; but actually rather more stable conditions will exist if synchronous condensers are installed. Voltage control at the supply point by means of synchronous condensers is more conveniently and satisfactorily carried out than by changing the voltage at the sending end, or altering transformer taps, which would be necessary if no synchronous condensers were installed. Synchronous condensers can provide reactive kVA where it is wanted near the load, and consequently lagging currents need not be transmitted over inductive lines, and the voltage regulation of the system is better. When power is supplied over an inductive line there is a considerable phase angle between the voltage vectors at the two ends. Synchronous machines carrying load have also an internal phase displacement between their mechanical and voltage vectors. If machines at both ends of a line are operating as generators, the difference in their mechanical displacement will be approximately equal to the phase difference due to the load on the line. If the machine at the receiving end is a synchronous condenser, the mechanical displacement will be that of the generator and line, whereas if the receiving end machine is running as a motor, the total displacement will be due to the generator, line, and motor. If there is a change in load of either machines or line the displacements will change also; when the load changes suddenly, mechanical and electrical oscillations may occur.

When a synchronous machine is oscillating, the power flow and torque may be assumed to be proportional to the amplitude of swing, as shown by the line BAC in fig. 5. For large angles there will be a tendency for the power to droop, as shown by the line B_1AC_1, but, depending on the frequency of oscillation and the time-constant of the rotor, supplementary exciting currents will be induced which will prevent this droop. A damping winding on the rotor will produce a torque displacement curve BDCEB, and the oscillations will be quickly quenched. If two, or a group, of machines forming two systems are coupled by means of a small tie line, the torque will fall off for larger amplitudes of displacement, on account of the limited power that can flow over the line, and the relationship will be as shown by curve FAG. Such a tie line would be too small to hold the systems in synchronism when a bad load fluctuation occurred, although it might be sufficient to hold them in synchronism during normal steady service. A larger tie line would hold the systems in synchronism, but would allow too much current to pass if a fault occurred. A solution might be to connect portions only of the two systems together. In some cases where it is not economically feasible to build a sufficiently large tie line, the systems may be allowed to break apart (each carrying its own load) at a suitable point where the least disturbance to the power supply will occur.

Discussion in London.

Mr. C. H. MERZ opened the discussion by remarking that the paper was particularly opportune, as the legislature now seemed to have reached a state of stability. He hoped the system which would result from recent legislation would not be so complicated as some people seemed to think it would, although the paper was not very hopeful in that direction. Future development would result in an entirely new picture, and the author had directed attention to matters which would have to be guarded against. Fortunately, in general, the difficulties were got over as the system grew, although others might then be introduced by short-circuit currents, so that

a careful balance between the various factors was needed. Not only had the designed power to be considered, but also that which the system would have to carry momentarily under fault conditions, the latter not being so easy to provide for without running risks in other directions. Separate excitation of the main machines would not fit in with the policy (which was the right one) of subdividing generating units in a station. Regarding the author's reference to the cost of high-power switchgear, in this country it would invariably be necessary to lead the power out of a generating station at two, at least, or more voltages: therefore, the practice of connecting the transformers directly to the generators would lead to undesirable double transformation in series. It was that aspect which had led the Americans to do their switching at the generator voltage, in spite of the difficulties introduced thereby. He hoped that the design of synchronous condensers would be given immediate consideration, not left till such apparatus was called for; abroad the use of such plant had resulted in considerable savings being made. One of the most valuable features of the paper was that it urged engineers to look ahead.

Mr. A. R. Everest agreed that the paper was timely, for the new conditions that would arise in the near future would raise to prominence features which had not been conspicuous in the past, and might involve the adoption of measures that had not been considered necessary hitherto. It had apparently been realised some years ago that the time constant of generators could not be lengthened much beyond the present figure, and so the subject resolved itself into the use of automatic regulators.

Mr. W. E. Highfield thought that, good as the paper was, the author had chosen a somewhat confusing method of presenting his arguments. The problem centred round the employment of very long e.h.p. lines, and, when suggesting methods of compensation, the author must have held his breath a long time before advocating a reduction of frequency. The lower frequencies should be avoided, and although they were adopting the idea in Canada, they did not contemplate frequency-changing. High-voltage lines that supplied cotton mills had given trouble recently, and it was very difficult to explain to the millowner the reasons therefor; he gauged continuity of supply by his old steam reciprocating plant, which very seldom broke down, and electrical engineers must live up to the same standard. It was of interest to note that the lines concerned had been rectified, not by compensation, but by placing them underground in single-core cables.

Major A. M. Taylor pointed out that trouble was not confined to long lines, short ones being also involved if the power carried were large enough. The author looked at the subject from the alternator designer's point of view; his diagrams were not good, they did not show what was taking place from moment to moment, and were not a patch on the circle diagram, to explain which the speaker used several lantern slides. In America they had had considerable experience of the difficulties outlined in the paper, and it was significant that there the use of synchronous condensers was favoured in preference to regulation from the alternator end of the line.

Generating at a lower frequency and raising the frequency at the receiving end of the line in order to reduce the reactance of the line, when it was a long one, met with the speaker's approval; in fact, he had publicly suggested it, but it was not the only way, and it was not realised that raising the voltage was the best way to cure the reactance trouble; he believed very firmly that instead of the old rule of 1,000 volts per mile the voltage of even short transmission lines, if the power were considerable, could with advantage be doubled or even trebled: doubling the voltage reduced the reactance effect four-fold, and also greatly reduced the cost per kW transmitted by an overhead line.

Mr. H. W. Taylor outlined the advantages of separately exciting the main generator's exciter. The characteristic of an alternator controlled by a regulator as shown in fig. 4 was desirable, but only attainable if the exciter responded very quickly: it would do so if its time constant was low, and therefore when separately excited. The small exciter must not be considered as a fractional horse-power machine; it must be designed for much more than it would be called upon to perform, and in the case of the plant with the design of which he was associated the small machine was made in the same shop and under similar conditions as the large one.

Mr. A. Wright endorsed what had been said about the circle diagram, and explained that the American 220,000-volt lines had been perfectly stable up to 250 miles in length, and would carry much more power than the normal in case of emergency. When the length was increased to 400 miles, however, very different conditions obtained.

Mr. F. H. Clough, in reply, explained that he did not advocate two frequency conversions: in the case of water wheels low-speed generators were usual, and a low frequency would therefore be convenient and involve conversion at the receiving end only. With synchronous condensers located along a very long line he could visualise the current distribution being somewhat like a corkscrew: the machines at either end would be mechanically displaced by perhaps half a revolution; it was owing to the phase difference between the voltage vectors at the two ends of an inductive line that he suggested frequency changing. The 400-mile American line mentioned failed because the phase angle was so large, whereas in the case of a 250-mile line the voltage had been chosen so high as to keep the reactance of the line low, and it was therefore stable. Synchronous condensers were preferable from the operating point of view, and their use would not be more expensive than providing all the reactive kVA in the main generators.

South African Railway Electrification.

Some instructive operating data relative to the 175 route miles of converted main line in Natal between Glencoe and Pietermaritzburg.

ONE of the most important developments in railway operation in South Africa took place during June, 1926, at which date the work of converting 175 route miles of the Natal main line from steam to electric traction had reached the stage of permitting the introduction of a full electric service between Glencoe and Pietermaritzburg. In that connection the following extracts from the report of the general manager of the State Railways and Harbours Board for the year ended March 31st, 1926, are of considerable interest. He refers, of course, to the 95 electric locomotives supplied by the Metropolitan-Vickers Electrical Co., Ltd., for operation on the line in question:—

"It is as yet too early to give the actual economic advantages, expressed in money, of electric traction, as compared with steam, or to comment thereon extensively, but it is possible to give actual results in respect of some of the features of the two methods of transportation during the period the scheme has been in process of completion. The electric locomotive has been quick to demonstrate its superiority in two directions, particularly higher speeds on grades and increased availability for traffic purposes. Whereas the electric locomotives are, under normal conditions, available during approximately 90 per cent. of the twenty-four hours, the steam locomotives on the same section were ordinarily available for not more than 50 per cent. of the time. The greater continuous capacity of the electric locomotive has enabled heavier individual trains to be handled at higher speeds than was practicable with the steam locomotive. An analysis of the operating speeds on the electrified section shows, for example, that one of the passenger trains which formerly required 8 hours 17 minutes for the 175-mile run, is now handled in 7 hours 47 minutes, an acceleration in schedule speed of 30 minutes. In the reverse direction an acceleration of 37 minutes has been obtained.

"A typical goods train schedule shows a decrease of 6 hours and 15 minutes under electric traction. The schedule for a steam locomotive to haul the heaviest trains between Glencoe and Pietermaritzburg was 16 hours 30 minutes with the following loads:—

From Glencoe to Ladysmith	1,000 tons.
From Ladysmith to Mooi River	820 tons.
From Mooi River to Pietermaritzburg ...	850 tons.

"Three electric units manipulated by one driver and an assistant now convey 1,500 tons throughout the distance in 10 hours 15 minutes. The load for the journey in the reverse direction (from Pietermaritzburg to Glencoe) with one steam locomotive was 385 tons, the schedule time allowance being 14 hours; with three electric units 800 tons are hauled to a schedule time allowance of 10 hours. These accelerations have had the effect of considerably speeding up the transit of traffic on the Natal main line. The average transit for coal trains between Glencoe and Booth Junction under steam conditions was 34 hours 15 minutes; the journey is now performed in approximately 25 hours 9 minutes. In the reverse direction the transit time for 'empties' to the collieries has been reduced by 9 hours 26 minutes.

"Under steam conditions the factors which contributed principally to the lengthier transit were: low speeds up gradients; remarshalling of trains at Ladysmith, Mooi River, and Pietermaritzburg owing to the varying load restrictions over the different sections, and time occupied at frequent intervals for watering locomotives and attending thereto on the journey. A 1,500-ton train is conveyed the entire route between Glencoe and Pietermaritzburg by electric traction without being disturbed; the average speed up the gradient between Estcourt and Mooi River, where there is a ruling grade of 1 in 65, is 21 miles per hour, compared with eight miles per hour under steam; the electric locomotives require little or no attention en route.

"The electric units are averaging 7,000 miles per month, as against the steam locomotive's 2,700, and some of the units have already done 75,000 miles without heavy overhaul. Steam locomotives had frequently to be withdrawn from service for heavy repairs after having accomplished from 25,000 to 30,000 miles, although there are instances of such locomotives having given better performances. The heaviest tonnage moved south of Ladysmith under steam on any one day was 25,351 tons, and this was not accomplished without a considerable strain on the resources; in fact, the movement of such tonnage under steam conditions could not be maintained daily for any length of time.

"During the financial year ended March 31st, 1926, when a partial electric service was in operation, the average daily tonnage moved south of Ladysmith was 19,343, and the highest tonnage moved south on any one day totalled 27,466. The most recent records disclose that during July, 1926, when a full electric service was in operation, traffic (including passenger traffic) moved south of Ladysmith averaged 25,438 tons daily; the highest tonnage on any one day during the same period aggregated 27,104. The capacity of the line under electrification has up to now been governed by the number of electric locomotives available: from the experience gained to date, there is no reason why, with additional equipment, the existing line should not handle up to 40,000 tons a day, or more.

"Each electric unit has a one-hour rating of 20,000 lb. The largest steam locomotive displaced exerted a tractive effort, at 75 per cent. boiler pressure, of 48,375 lb., as compared with the 60,000 lb. of three electric units; the increased effort of the latter is steady in character, which makes it the more effective. It has been argued that a modern steam locomotive will haul 1,500 tons, whereas three electric units are required to haul an equivalent tonnage: this is correct, but, in the case of the steam locomotive, an important factor to be considered when making comparisons is the grade over which loads are hauled. It is true that a steam locomotive of the articulated type conveyed a load of over 1,500 tons between Pietermaritzburg and Cato Ridge, but this was on a grade of 1 in 100, and over a section where the electric units do not work. Three electric units are hauling 1,500 tons between Estcourt and Mooi River over a grade of 1 in 65; one particular steam locomotive conveyed 1,011 tons over the same section, but the electric units haul 1,500 tons in 68 minutes less time than it took the steam locomotive with 1,011 tons. For a steam engine to haul 1,500 tons up a grade of 1 in 65, it would require to be, approximately, of 75,000 lb. tractive effort, and even then the speed would probably be limited to 10 miles per hour, whereas three electric units convey 1,500 tons with ease at speeds averaging from 20 to 23 miles an hour.

"The steam locomotives used on the section now electrified were the most powerful on these railways. For handling the normal traffic before electrification, 130 steam locomotives were required. The motive power equipment for electric operation, which, incidentally, is being called upon to handle a greater tonnage than steam, includes seventy-eight 3,000-volt direct-current units designed for both passenger and goods work."

Correspondence.

Correspondents should forward their communications **as early as possible.** *No letter can be published unless we have the writer's name and address in our possession.*

A Memorial to Faraday.

Will you kindly permit me to invite the interest of your readers in the following:—

The progress of electrical science and industry in the past century is founded largely upon the results of the labours of the illustrious natural philosopher, Michael Faraday, whose experimental researches and discoveries opened wider the power-houses of nature and pointed the way to the utilisation of the forces stored therein, as evidenced by the present universal application of them, particularly electricity, in the service of mankind, and who, in the words of Sir Oliver Lodge, initiated a whole new profession—Electrical Engineering—while Sir Richard Gregory, in a recent presidential address, declared that "every dynamo in the world owes its origin to Faraday." In his lifetime he was described as "our great electrician."

Michael Faraday, to whom the world thus owes so large a debt of gratitude, was born in Southwark, the son of a blacksmith, whose forge stood near the well-known local landmark, the "Elephant and Castle."

To commemorate this great pioneer worker, who in the world of science holds a place almost equivalent to that of Shakespeare in the world of literature, the Southwark Borough Council desires to form a special collection of standard and current literature on electrical and allied sciences in the Central Reference Library of the borough, which is situated close to the spot where the forge stood.

It is suggested that the memorial shall include also a bust of Faraday.

The use of the library is not limited to local residents, but, like the benefits of Faraday's discoveries, is open to all. Moreover, it is centrally and conveniently situated near the junction of all the main thoroughfares of populous South London converging upon the principal London bridges; and it is well used—there was an issue of over 100,000 volumes last year.

It is purposed to create a Faraday Memorial Library Fund, the income from which would be expended in the acquisition of the best new books year by year, and so keep the memorial collection always abreast of developments in, and practical applications of, the sciences for which Faraday did so much.

The Council would welcome the co-operation of electricians and scientists generally, many of whom, it is believed, would be glad to know of this opportunity to assist, if only in a small measure, in establishing in Faraday's native borough a memorial that will be worthy, permanent, and increasingly useful in character.

The year 1927 has been described as the "Dawn of Britain's Electrical Age," and the time would thus seem appropriate to pay tribute to the memory of the man who made the "Electrical Age" possible.

The project has the interest and generous support of, among others, the Royal Society, the Royal Institution, Messrs. Benn Brothers, the British Electrical and Allied Manufacturers' Association, the Eastern Telegraph Co., the Western Union Telegraph Co., the British Thomson-Houston Co., the General Electric Co., Provincial Tramways Co., Ltd., Messrs. J. Dewrance & Co., Ltd., the County of London Electric Supply Co., the City of London Electric Light Co., the Edison Swan Electric Co., Messrs. W. H. Willcox & Co., and a number of private individuals.

I shall be happy to acknowledge any contributions which may be sent to the Town Hall, Walworth Road, S.E.17.

H. Hewitts,
Mayor.

Southwark, *February 15th*, 1927.

The Earthing of Portable Domestic Appliances.

I wish to support the views of Mr. R. H. Rawll, as expressed in his article on the earthing of portable domestic appliances. In my house I have provided all-electric equipment, including water heating, although one coal fire is in fairly constant use in the kitchen. All the plugs are three-pin, and each earth-pin socket is connected to earth *via* the lead covering of the wires and the water pipe. All the appliances, with the exception of table lamps and the vacuum cleaner (this was supplied with a long piece of 2-core flex which I have not yet changed to 3-core), are earthed. With the exception of two Berry fires and a wash boiler, no provision was made on any of the apparatus for earthing. The earthing of stationary apparatus presents no difficulty, but portable apparatus, such as saucepans with plug and socket connections, and perhaps three heat control by a combination of three pins and three sockets, present difficulties when earthing is desired. Manufacturers only supply these with earthing connections if specially ordered. I have never tried specially ordering, as I should probably have to wait about eight weeks and pay extra. My method is to attach an earth connection myself, and here another difficulty arises. The insulation of the slip-on sockets is so weak mechanically that it is difficult to work, and if it be broken I invariably find that the replacement (worth 4d. at the most), must be specially ordered. I don't know whether the B.E.S.A. specification calls for earthing these appliances, but as there is nothing to prevent their use near a water tap the I.E.E. wiring rules do call for earthing.

Some supply authorities are deserving of blame in connection with this matter. There are one or two with very stringent regulations of their own who have showrooms containing all kinds of gadgets without any provision for earthing. They also put their service cables and meters over concrete floors, and do not earth them or box them so that there is no risk of anyone touching them.

There have been many fatal shocks from hand lamps—hence the regulations. Must history repeat itself, or shall we be wise in time?

A.M.I.E.E.

[The fatalities in connection with hand lamps have not occurred in private houses.—Eds. Elec. Rev.]

The article by Mr. R. H. Rawll under the above heading in your issue of February 11th raises several points of considerable interest and importance.

Personally, I am inclined to agree with Mr. Rawll in principle, but the solution is not as simple as he would have us believe.

Assuming that one agrees that all appliances should be earthed because they may be used in rooms where earthing is regarded as essential, it necessarily follows that manufacturers must discontinue their present practice of supplying small domestic appliances, such as kettles, irons, &c., taking, say, 500 watts or less, with adaptors and twin flex.

To guard against the danger which Mr. Rawll suggests, they should be fitted always with 3-core flex and a 3-pin plug.

Admittedly the cost of a 3-pin earthing plug and socket is not very serious, but although it acts as a safeguard against accidental contact with "live" apparatus it does not entirely meet cases such as occur in sculleries, bathrooms, &c., where the switch also is a potential source of danger. Here either the switch should be entirely insulated or the dolly earthed. The ideal arrangement is a 15-ampere combined interlocking 3-pin earthing switch-plug. I have for a long time been trying to find such an article which, while being capable of breaking 3 kW at 230 volts, is sold at a reasonable price and is not such an ugly and clumsy-looking piece of apparatus as to be vetoed for use in a lady's drawing-room.

All switches on heating circuits must be capable of breaking the circuit of a 3-kW fire "full on," as people are not always careful to operate the switches on the fire first.

The potential market for such an article is so great that the manufacturers would be well advised to get busy on the problem—by no means an easy one.

Incidentally, if it is to be generally accepted that all portable apparatus must be earthed, since their use may not be restricted to rooms where they may be deemed safe, even 5-ampere plugs should be 3-pin and all flex connected to such appliances 3-core.

By the way, does Mr. Rawll propose to wire all plug points, when C.T.S. is used, with 3-core cable?

So much for this side of the picture. The other side is this: Are we not making too much fuss about the whole business?

How many fatal accidents from unearthed apparatus have been recorded in, say, the last ten years?

Which is likely to have the greater deterrent effect on the more general use of electrical apparatus, an ever-increasing cost of installation, or the remote risk of a fatality, or of some such unpleasant experience as an individual who shaves in the bathroom and gets more than he has asked for from his sponge?

I express no opinion, but invite your readers to give theirs.

The Midland Electric Power Installation Co.
H. Joseph, *Proprietor.*

Wolverhampton, *February 15th*, 1927.

[The opinion which we hold, and have repeatedly expressed, is that endeavours to secure 100 per cent. safety are misguided, and doomed to failure. An installation may be wired and equipped in faultless style, complying with the most stringent "rules," but how long will it remain perfect? When flexibles are renewed, as they must be, what likelihood is there that three-core flexibles will be used? What assurance is there that the earthing connections, leads, or bonds will never be severed—without the slightest indication of the fact? Above all, what need is there for absolute safety, when no such burden is imposed upon gas, oil lamps, candles, matches, coal and coke fires, windows, staircases, and other potential sources of danger in private houses? Statistics should govern the question; there have been probably more deaths through noxious gases entering houses from short-circuits on electric mains in the street than from electric shocks received inside private houses in this country. Only in such places as bathrooms are special precautions essential.

The imposition of irksome and superfluous restrictions and regulations on the public is a characteristic national fetish.—Eds. Elec. Rev.]

Electricity Supply Tariffs.

In his comments upon my recent articles, Mr. Lunn quotes the Darlington tariffs against those of Basle, and concludes that my figures are not representative. Let me assure Mr. Lunn that a glance at the published data of the electrical undertakings in the U.K. will be sufficient to convince him that the figures which are not representative are those of Darlington. And this is true even when they are compared with the tariffs of much larger stations. In this comparison I need not take advantage of the high figures of 1926 which were affected by the recent coal strike. I will confine myself to 1925. Then, as against £3 and 0.25d. for power in Darlington, I find that the price in Liverpool was £6 and 0.4d. Or, on comparing towns more like Darlington and Basle in size—for we must pay attention to the size and character of the undertaking—let me ask Mr. Lunn if he can point to any town of 70,000 inhabitants in which the prices are as low as his?

Again, as regards cooking and heating, the Darlington figure is almost unique. A comparison of all the undertakings of reasonable size in the U.K. shows that the average price per kelvin for this purpose is about 1.5d., as against 0.75d. in Darlington.

How Mr. Lunn has achieved the figure of 0.56d. as the cost per unit sold on a load factor of 26.36 per cent. I cannot explain, but he asks a very pertinent question in connection therewith. "Why," he asks, "should electricity not be supplied in most towns in this country at prices lower than those in Switzerland?" Ah! Why, indeed! That, also, I cannot explain!

But, relatively to my main contention, these are side issues. It has been stated before the I.E.E. that the second 25 per cent. of load factor can be delivered at a quarter the price of the first. If, therefore, Mr. Lunn could increase his l.f. from 26.36 per cent. to the Basle figure of 74 per cent., he could reduce his prices much further and establish a record. Now the domestic load is usually considered to be the worst for this purpose, and yet it is by encouraging this very load in the proper manner that 74 per cent. has been achieved. And the chief instruments have been tariffs B (8) and (9), the deferred payment agreement A (2), and simple but reliable time switches. Mr. Lunn's seasonal system is undoubtedly a step in the right direction, but it will only improve the seasonal load factor. It is the diurnal load factor that needs attention.

There is much force in Mr. Legge's contention as to cooking during peak hours. But it is also true that in many small Swiss households the chief meal is taken at mid-day, and much can be done by the intelligent use of long-hour electric apparatus embodying the "hay-box" principle.

Mr. Thwaites points out that in certain English towns the prices for large amounts of power are lower than in Basle. So they ought to be. But is it quite fair to compare great industrial centres of half-a-million inhabitants with Basle and its population of 145,000?

The University, Birmingham. **William Cramp.**
February 20th, 1927.

A Knotty Problem.

Referring to "A Knotty Problem" in the "Correspondence" columns of your issue of the 18th inst., it is difficult to advise on this matter without adding to the perplexities of "Perplexed."

The principal claims of the screwed-conduit system to superiority over other systems are complete protection of the conductors from mechanical injury, and immunity from fire. These claims can, however, only be substantiated if the system is complete with ironclad switches and fuseboards, and totally enclosed lighting units. These conditions are costly, the whole installation is somewhat inflexible, and does not lend itself well to extensions and alterations, and, in my opinion, is not suitable or necessary for the premises and requirements under consideration.

Grip conduit will give the required degree of protection, and is easier to install; the ordinary standard type of fittings can be employed, and it is consequently cheaper than the screwed job.

Other systems of wiring mentioned, *viz.*, metal-sheathed, C.T.S., and Maconite, are approved by the Institution of Electrical Engineers, and may be adopted with confidence, provided that the I.E.E. "Regulations for the Electrical Equipment of Buildings" are observed.

The majority of installation contractors specialise each in one particular system of wiring, and carry a stock of the particular material required; therefore it is only natural to assume that they will specify, and boost, that system.

A more important point than the choice of system is the question of workmanship, and my advice to "Perplexed" is to put the matter in the hands of a reliable and reputable contractor, and to cease from troubling himself.

Epsom, *February 19th*, 1927. **H. H. Atkinson.**

Kiosk-Type Sub-stations.

Is it not high time that manufacturers of kiosk-type sub-stations realised that it is even more important in an outdoor kiosk than in an indoor cubicle to protect live conductors against accidental contact?

It is common practice in cubicle work to provide separate doors for the isolating switch and oil switch compartments, yet in the kiosk described in your issue of February 11th (page 231), which purports to represent the latest practice, a single door is provided, and the writer claims that "the design has been considerably simplified" by providing only one interlocked door.

This interlocking, however, does not prevent the switch attendant from coming into accidental contact with the live isolating switch blades when he is inspecting the oil-switch contacts, &c., the risk of which is far greater when one is slipping about on wet grass in inclement weather and with imperfect lighting.

An interior door to the isolating-switch compartment, even if it were only expanded metal, would guard against this danger.

P. M. W.

Waltham Cross, *February 18th*, 1927.

The Salaries of Engineers.

There exist, to my knowledge, two organisations whose functions are partly to safeguard the status of the technically-trained electrical engineer. I refer to the Chartered Institution of Electrical Engineers, and to the National Union of Scientific Workers. The former exists only in the interests of electrical engineers; the latter exists, professedly, in the interests of all technically trained men, including electrical engineers. These bodies are unlike, in that the former is well known, whilst the latter is but little known, in spite of its 8½ years of existence. They are alike, however, in their

persistent neglect to tackle the most urgent problem of the electrical engineer—that of starvation salaries. Since they refuse to perform this portion of their functions, it becomes necessary for the private individual to do what he can to forward the interests of the technical man. Hence this letter.

I see that a world-famous firm with London offices advertised a post in your last issue. The *essential* requirements (my italics) are: "(1) A thorough knowledge of the French language. (2) A sound general education and technical training. (3) Practical training and experience in the manufacture, erection, and running of heavy electrical plant; (4) Commercial experience in the preparation of tenders and correspondence. (5) Outside commercial experience."

The munificent salary offered for this highly trained man is £350 per annum. The probability is that some poor blighter, in desperate straits, will sell his services for this salary. Comment is unnecessary, but I cry shame on any employer who so disgraces himself, and on the bodies who profess to safeguard our interests, and fail to make the slightest attempt to do so.

February 18th, 1927. **Another Poor Blighter.**

Extra-High-Pressure Transmission.

The letter by Mr. W. Fennell in your issue of February 11th raises the important question: Which is the more reliable, an overhead line or an underground supply? He then proceeds to take up the case for the overhead, at the same time giving the impression that the author of the article in question takes the opposite view.

Mr. Fennell shows the important distinction between the frequency of failure and the length of stoppage, and reasonably associates the former with overhead lines, and the latter with cables. His humorous reference to sending a window-cleaning gang out on an overhead line may be more to the point than is intended, for, much as the wise and bold policy of replacing insulators in a bad position has to recommend it, this policy will, in many cases, only postpone the date at which the porcelain cleaning gang will be necessary.

To have to clean insulators is not unusual even in power stations. Outside, the rain will not always do this duty, especially under the sheds of the insulators. Fortunately, cleaning is not often required, but where pin insulators are used in bad situations for voltages of 33,000 V and above, it is certainly most desirable yet difficult to carry it out.

A further difficulty not altogether solved is the quick location of a faulty insulator; and where overhead lines are very long and take short cuts over difficult country, patrol is not easy, and repairs may take a considerable time to effect.

There are certain inherent weaknesses in overhead lines which cannot be overlooked, especially where large bulk supplies are concerned, and where real continuity is essential. For such continuity a duplicate supply is necessary, and not merely an alternative supply as suggested.

Overhead lines have to work under adverse conditions such as are outlined in an article in your issue of December 3rd last. It is hoped that by pointing out and promoting discussion on the weaknesses of overhead lines, the necessity for really sound and reliable cables for super-pressures will be made more generally evident, for both overhead lines and cables for these pressures are necessary, and the development of the former has not kept pace with the latter.

With regard to Mr. Fennell's reference to G.P.O. trunk lines, he has apparently been unwittingly assisting in providing revenue for the financing of extensive underground developments for some years, and the responsible authorities would no doubt inform him of their activities if requested.

London, *February 15th*, 1927. **A. T. Scott.**

5,237. "Wireless receiving apparatus." C. H. C. Cansdale. February 24th, 1926. (265,017.)

5,941. "Tuned amplifying circuits for wireless receiving apparatus and the like." Lovejoy Development Corporation. June 4th, 1925. (253,072.)

8,749. "Automatic quick-acting circuit-breaking device." P. J. Branchu. April 8th, 1925. (250,570.)

9,355. "Electric illuminated advertising device." H. K. T. Lindquist and C. V. Madsen. April 9th, 1926. (265,038.)

9,442. "Uniformly-loaded signalling conductors for the transmission of currents of acoustic frequencies." Felten & Guilleaume Carlswerke Akt. Ges. June 8th, 1925. (253,078.)

9,615. "Electric traction system for agricultural implements." F. Remy. April 12th, 1926. (265,040.)

10,070. "Systems for converting electric currents." British Thomson-Houston Co., Ltd. April 18th, 1925. (250,966.)

12,140. "High-frequency electric signalling systems." British Thomson-Houston Co., Ltd. May 11th, 1925. (252,027.)

12,286. "Method and apparatus for removing hydrogen from the surface of metal objects to be coated by electrolysis." L. J. J. Van der Hoorn. May 12th, 1926. (265,047.)

12,821. "Variable electric condensers." International General Electric Co., Inc. May 22nd, 1925. (252,376.)

16,081. "Sound recording or reproducing devices." Standard Telephones and Cables, Ltd. May 29th, 1925. (Divided application on 23,665/25.) (254,333.)

16,083. "Horns for acoustical instruments." Standard Telephones and Cables, Ltd. (Bell Telephone Laboratories, Inc.). September 22nd, 1925. (Divided application on 23,664/25.) (265,060.)

17,556. "Hollow electric cables." Siemens-Schuckertwerke Ges. April 29th, 1926. (Addition to 254,308.) (265,066.)

Trade Mark Applications.

The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from February 16th:—

Tropex. No. 476,330. Class 4. Raw or partly-prepared vegetable, animal and mineral substances used in manufactures.—Chloride Electrical Storage Co., Ltd.

Mecvent. No. 476,789. Class 6. Electrical fans and blowers.—P. M. Millns, trading as the Millns Electrical Co., 17, Whitefriars Street, E.C.4.

E.S. (lettering and design). No. 474,990. Class 8. Electrical measuring instruments, switchboards, cables, current limiters, accumulators, radio-telephonic receiving apparatus, and parts therefor.—Edison Swan Electric Co., Ltd.

Nora. No. 476,192. Class 8. Apparatus for radio-telephony.—Aronwerke Elektricitats Gesellschaft, Charlottenburg. (British representative: Henry Fairbrother, 30-32, Ludgate Hill, E.C.4.)

Hegra (lettering and design). No. 476,581. Class 8. Apparatus for use in radio-telegraphy and telephony.—B. Becker, trading as George Becker, 203-205, Edgware Road, W.2.

Allhall. No. 476,591. Class 8. Loud speakers.—L. Kremner, 49a, Shudehill, Manchester.

Junoscale. No. 476,903. Class 8. Electrical measuring instruments.—Johnson & Phillips, Ltd.

Asbestulon. No. 476,275. Class 50. Insulating substances (electrical).—Thomas de la Rue & Co., Ltd.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

AIREDALE (Yorks).—Kinema, for A. Whitaker, The Square.

ALTRINCHAM.—Extensions, County Girls' School; Cheshire Education Committee.

AYRSHIRE.—Central fire station at Kilmarnock; burgh surveyor, Kilmarnock. Alterations to Alloway Public Hall (heating installation by radiators); Sir Robert Lorimer, architect.

BAWTRY.—Housing scheme (80), for Doncaster R.D.C.; Walker & Thompson, architects, Carbon Chambers, 7, Hall Gate, Doncaster.

BECKENHAM.—Roman Catholic church; J. B. L. Tolhurst, architect.

BEDFORDSHIRE.—Ouse improvement scheme (legislation necessary) (£2,750,000); Board of Agriculture.

BIRKENHEAD.—Kinema, Borough Road; H. A. Thomas, Liverpool.

BOSTON.—Additional 70 houses, for the R.D.C.; surveyor.

BOURNEMOUTH.—Additions, Donegal Works, Hamkinson Road; H. C. Skerratt, Ltd. Pavilion, Woodland Avenue, for Corporation; J. Scott.

BURFORD (Oxon).—Cotswold Gateway Hotel (with electrical work and heating), for H. G. Powell, Kidlington; J. R. Wilkins, architect, Oxford.

BURTON-ON-TRENT.—Additional 300 houses, for the T.C.; borough surveyor.

CANTERBURY.—Re-erection of premises, High Street, for H. J. Goulden, Ltd. (several thousand pounds).

CARDIFF.—Conversion of Green Dragon premises for tram dept. offices; city architect.

CHATHAM.—Hospital extensions (£39,000), for Medway B.G.; C. W. W. Thompson, architect, Rochester; F. E. Wallis, builder, Maidstone.

CONGLETON.—Housing scheme (108), for the T.C.; borough surveyor.

CROYDON.—Super kinema, Main Road; Pavilions, Ltd., 505, Oxford Street, London, W. Hotel. Aerodrome (£50,000), for Barclay, Perkins & Co., Ltd.; E. P. Pullan, secretary.

DONCASTER.—Reinstatement, after fire (several thousands pounds damage) of clothing store and casual ward at Doncaster Workhouse; clerk, Board of Guardians.

DUMFRIES.—Extensions, with electrical work (£2,450), for the Dumfries-shire Unionist Association, Loreburn Street; secretary.

EARLESTOWN (Lancs.).—Additional 152 houses, for the U.D.C.; surveyor.

EDINBURGH.—Working men's hostel; city architect.

FIFESHIRE.—Golf cleek factory at Anstruther; c/o burgh surveyor.

GLASGOW.—Public hall in East End; city engineer. 306 houses and 10 shops at Ruchill, for Corporation; city architect. Extensions, including Central Hall (£35,000) for School of Art; John Keppie & Henderson, architects. Improvements, Queen's Theatre, Watson Street; B. Fruitin.

GUILDFORD.—Flats (60), Aldershot Road, for the T.C.; J. W. Hipwood, borough engineer, Tuns Gate.

HALESOWEN.—Electric light installation, Congregational Hall; H. Jones, secretary, 53, Stourbridge Road. Super-kinema (£12,000), for S. Bray; T. Stanley Beach, architect; Messrs. Tate, builders, Cradley.

HEADINGTON.—Housing scheme (436); W. Page Webb, architect, 23, High Street, New Headington, Oxford.

HEREFORD.—Tile factory, Barr's Court; city surveyor.

HEYWOOD.—Housing scheme (100), for T.C.; G. A. Russell and Sons, builders.

HUDDERSFIELD.—Extensions to Greenhead High School and Almondbury Grammar School, for the Borough E.C.; borough architect. Hospital block at Crosland Moor Institution; clerk to Board of Guardians.

KIRKINTILLOCH.—School clinic (£6,000); clerk, Education Authority, Dumbarton.

LITTLEWORTH (Stafford).—St. John's Church; Sir Charles A. Nicholson, architect, London.

LONDON (Becontree, E.).—Hall, Dagenham Avenue; Salvation Army.

LONDON—*continued.*

(East Ham, E.).—Alterations, Coliseum Cinema, Green Street; Scriven & Huxtable.

(Ilford, E.).—Re-erection of portion of factory, Farnham Road, Seven Kings, for the Metropolitan Wire Spring Mattress Co. Extensions, Highways Depôt; borough engineer.

(St. John's Wood, N.W.).—Flats, Circus Road and Grove End Road; Central London Building Co.

(Downham, S.E.).—Additional schools (£41,790), for the London E.C.; Holland & Hannen & Cubitts, Ltd., builders.

(Kennington, S.E.).—Enlargement Beaufoy Institute (£12,000); L.C.C. architect.

(Battersea, S.W.).—Enlargement, Lavender Hill Pavilion; Pavilions, Ltd.

(Clapham, S.W.).—Five blocks of flats, Albion Road; C. Miskin & Son.

(Hammersmith, S.W.).—Central school near Western Avenue; L.C.C. architect.

(Marble Arch, W.).—Enlargement, Marble Arch Pavilion; F. T. Verney, architect, Pavilions, Ltd.

(W.).—Shops, flats, restaurant, &c., adjoining Baker Street Underground Station; Metropolitan Railway Co.

MAIDENHEAD.—Kinema and dance hall, Bridge Street; Maidenhead Picture Theatre, Ltd.

MAIDSTONE (Leeds).—Alterations, with lighting and heating (£100,000), Leeds Castle, for Mr. Wilson-Filmer.

MEXBOROUGH.—Dance hall, shops, and billiard hall, next Palace Kinema; Mexborough Electric Theatre, Ltd.

MIDDLESBROUGH.—Dock and river improvement scheme, for the Tees Commissioners. School clinic, Woodlands Road (£5,500); director of education.

MORLEY.—48 houses, Bradford Road; borough engineer.

NEWPORT (Isle of Wight).—Corn exchange, &c., for the T.C. (£5,000); borough surveyor.

NORTHAMPTON.—Factory extension, Overstone Road; Mounts Factory Co.

PORTSMOUTH.—Workshops for the blind, Portsdown Hill; borough engineer.

RICHMOND (Surrey).—Houses (35), for the T.C.; Streek and Co., Ltd., builders, Tranquil Vale, Blackheath, S.E.

RIPON.—Housing scheme (38); city engineer.

SALE (Cheshire).—Re-erection of factory, for I. & E. Nelson, hosiery manufacturers (several thousand pounds).

SEDGLEY.—Electricity generating station, Redhall Road; Lower Gornal Picture Palace Co.

SOLIHULL.—Extensions, Grammar School; governors.

STIRLINGSHIRE.—New classrooms, laboratory, and gymnasium at Balfron School; clerk, Stirlingshire Education Authority, Stirling. Advanced subjects school at Stirling (£48,000). Additions to five primary schools (£72,545); clerk, Education Authority, Stirling.

STOCKTON-ON-TEES.—Cinema, Norton Avenue, Norton, for Norton Cinema Co., Brandon. Re-housing scheme, Mount Pleasant (£56,000); borough engineer.

STRETFORD.—Alterations, workshops, Empress Street; Empress Coppersmiths & Engineers, Ltd.

SWANSEA (Landore).—Roman Catholic church, Dinas Street; Rev. Father Harrington.

TAIN.—Hall for Parish Church (electric lighting and heating); A. Maitland & Sons, architects.

WALTON-ON-THAMES.—70 houses for U.D.C.; G. B. Carvill.

WARWICK.—Office accommodation, Militia Barracks; Warwickshire C.C.

WEAVERHAM.—School extensions (£4,300), for Cheshire E.C.; F. A. Brown, county architect, Newgate Street, Chester.

WESTON-SUPER-MARE. — Business premises, Meadow Street, for E. J. Steel, draper (several thousand pounds).

WEYMOUTH.—84 houses, Down Close, for Corporation; James Drewitt & Son, Bournemouth.

WHITCHURCH (Salop).—Housing scheme (60), for the U.D.C.; surveyor.

YEOVIL.—Housing scheme (296), for the T.C.; Eadie Towers and Co., Wolverhampton.

The

Electrical Review

VOL. C. MARCH 4, 1927. No. 2,571

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

The Electrical Industry.

AS was briefly mentioned in our last issue, a "Monograph on the Electrical Industry" has been prepared by the B.E.A.M.A. for the information of Committee "B" of the World Economic Conference Preparatory Committee. In a foreword Mr. D. N. Dunlop intimates that a study of international developments in the electrical industry, both technical and economic, would possess great importance—if it could be carried out with accuracy—at the present time "when the whole industry is in a state of flux, preparatory to embarking on a period of rapid expansion." In this Monograph, therefore, the B.E.A.M.A. has prepared a partial survey assembling all available relevant data, and it has carried out an international census bearing on the production of electrical goods, the world market, actual and potential, for such products, and the distribution of production costs and prices.

The estimates differ materially, at times, from those made in the German Monograph submitted to the same Committee by the Zentralverband der Deutschen Elektrotechnischen Industrie, and it is felt, therefore, that the British survey and the German document should be read in conjunction. It is pointed out that in the expression of general principles there is fairly close agreement between the two surveys, but there is natural confusion in comparing foreign trade statistics where the official interpretations of classifications of trade returns vary.

The document reviews the developments that have taken place in organisation and technique of the electrical industry in different countries. Beyond certain lamp production arrangements, international agreement on a large scale does not exist in the electrical industry; though the leading American and German firms have come into contact again for

exchange of research data and manufacturing experience, "no international control either over production or price has yet been attempted." This statement reached us just as reports were appearing in the newspaper Press to the effect that a big combine of German and American electrical concerns was under discussion. The various sections of the B.E.A.M.A. Monograph contain much statistical and other information respecting the world production of electrical goods, the development of electrical export trade, and the consumption of electrical goods in different countries in 1925 per head of population. There is a section on the world market for electrical goods, in which the production of electricity in various countries is tabulated and comments are made upon the place and measure of development of electrical power in industry and transport. The statistics foretell a prospect of great expansion of the electrical industry due to the uses of electrical power in these directions; notes on the distribution of production costs, and on the significance of prices, form the closing sections.

The valuable information here brought together hardly lends itself to brief review. The whole document requires to be read with care by all who are deeply concerned with questions of vital interest to the industry if they aspire to be up to date in their knowledge of affairs, tendencies, and prospects.

The Last Month of the Campaign.

As we have just entered the month of March, we take the liberty of reminding our readers that the E.D.A.-E.L.M.A. Better Home Lighting Campaign is nearing its end so far as the actual competition is concerned. The Perforated Ballot Sheet has to be removed from the booklet 1002 and posted to the E.D.A. offices, 15, Savoy Street, Strand, London, W.C.2, on or before March 31st. It is not yet time to attempt a review of the great work that has been and is being accomplished, though the temptation is strong upon us to say congratulatory things regarding those who have really seriously co-operated. We prefer to direct everybody's attention to the much that remains to be done and to the great opportunity that presents itself of making this last month the best of all. Weekly progress reports to which we have given publicity tell a story of the many thousands who have been interested in the electrification of the home during the past five months through the various electric houses that have been co-operatively prepared for their inspection. Though the story is necessarily incomplete, anybody can see that a wonderful propaganda work for the industry has been done, and that its good effect will never end. Yet we are wondering how the map on page 10 of the E.D.A. publication 1000 will look when we have been enabled to fill it in with colour varying from brilliant red to the palest nondescript hue indicating the campaign temperature of the different areas. There is time in the next three or four weeks to change the story that will be told by such a map if it be published.

Dr. S. Z. de Ferranti, F.R.S.

It was with great pleasure that we learnt that the President and Council of the Royal Society at their recent meeting decided to recommend for election into the Society Dr. S. Z. de Ferranti. Of all the distinctions that the world of science has to offer, there is none more coveted, more jealously guarded, or more difficult to acquire, than the Fellowship of the Royal Society of Great Britain, which excels all academic degrees in dignity and status, and is in itself a guarantee that, in the proud formula of the Legion of Honour, the man who bears it has deserved well of his country. It is awarded not on the strength of any written or oral examination, but on the sterner and more searching test of public opinion as moulded by assured knowledge of achievement of the highest order—sometimes a single epoch-making discovery, sometimes the fruit of the work of a lifetime.

It is under the latter category that Dr. Ferranti may perhaps be classified. Like Edison, whose eightieth birthday we recorded a few weeks ago, he entered the electricity supply industry at a time when it was a conception rather than a reality; in those days the great pioneers invented new devices as the need arose, and thought nothing of the feat—but whereas Edison adopted the direct-current system, Ferranti followed the a.c. path, taught the world to transmit electricity at high pressure from outside a city to transformers connected in parallel, and thus laid the foundations of the great business of a.c. generation, transmission, and distribution which is transforming the conditions of human existence throughout the world. Ferranti, with dauntless courage and inexhaustible resource, designed his own generators of unprecedented dimensions, his own cables for unheard-of pressures, his own transformers and switchgear—and inspired in his colleagues and pupils a personal devotion which to-day bears witness to the charm of manner and the sterling worth of a great leader.

Had the nation followed Ferranti it would have led the world in electrical engineering. The least we can do is to recognise that he indicated clearly the right way to go, and that the Electricity Act of 1926 is a belated attempt to regain that path and carry out the policy that he initiated. We are sure, therefore, that all electrical engineers will join us in congratulating him on his Fellowship, and in the hope that the example set by Science will be followed by the State.

Ultra-Violet Rays.

We notice that, in accordance with professional advice, the London County Council's Control Committee has refused to sanction the use of ultra-violet rays at a massage establishment without medical supervision, on the ground that the treatment has potential dangers. The medical profession possesses one of the strongest of all trade unions, the only stronger one, perhaps, being the law, and we feel no surprise at the action which has been taken in this matter. Where the danger is real and inherent, as in the case of X-rays, we entirely agree with the view that the amateur should be warned off the ground, for his own sake and that of his family, but ultra-violet radiation is on a different footing.

The fact is that medical men for some time past have been preaching the merits of ultra-violet rays, whether natural or artificial; if the former cannot be obtained, the latter afford the only alternative, and a brisk demand is springing up for the means of producing them, which is in course of being met by numerous manufacturers. That the medical profession should seek to retain control of this valuable curative agency is perfectly natural; but it is not likely to be successful in that aim. Just as, for instance, aspirin has passed from professional hands into general use, so will ultra-violet radiation become a household commonplace. It is not without significance that it is to be found in the Ideal Home Exhibition which was opened on Tuesday.

However, it is only in houses equipped for electric lighting that this will be possible, and as not more than one home in five is so equipped, the field is limited. The successful practice of electrical treatment will arouse the interest of the residents in gas-lighted houses, who must perforce go to their medical attendants if they wish to obtain such treatment for themselves—and thus the movement, which is gathering way, will benefit the medical profession in the long run, besides benefiting the user.

Agricultural Electrical Machinery.

A comparative review of the exhibits at the 1927 Paris Agricultural Exhibition with those of previous years, and machines employed in other countries, depicting some items of special interest to engineers at home.

By R. BORLASE MATTHEWS, Wh.Ex., A.M.Inst.C.E., M.I.E.E., F.R.Ae.S.

NEARLY 1,000 electric motors were either shown or utilised for driving the machines on view at the above exhibition. This is indicative of the rapidly growing appreciation of the electric-motor drive in connection with agricultural work on the Continent. Of course, the oil engine has not yet been entirely displaced, as there are still regions where public electricity supply is not available, and quite a number of such engines were exhibited; but naturally they were not employed to demonstrate the driving of machinery when a more up-to-date method was available. Incidentally, it may be remarked that there is a distinct trend in the design of small petrol and paraffin oil engines towards a very neat and clean external appearance. Amongst the neater type of engine was one of British make—the Lister. Where such engines were employed for driving dynamos, direct coupling was adopted almost without exception.

Fig. 1.—Law ½-h.p. Portable Motor.

A feature of the exhibition was a special display of portable electric agricultural motors shown driving various forms of farm machines. This special exhibit was arranged by the Union des Syndicats de l'Electricité. Some detailed notes concerning this exhibit will be given a little later on.

This was the sixth French exhibition devoted entirely to agricultural machinery without the inclusion of any livestock whatsoever. In England the general feature of agricultural shows is the livestock, while the machinery exhibits seem to be a sort of "Cinderella," only admitted by the authorities because they can ill afford to dispense with the income that is provided by the rents of the spaces occupied. At the Paris exhibition there were 623 exhibitors, a 25-per cent. increase over the figure of last year. The stands taken occupied 50,000 square yards. There were no German exhibitors, but it is proposed to admit them next year. British manufacturers were well represented, and included Ruston & Hornsby; Ransomes, Sims and Jefferies; Clayton; Austin & Fordson Tractors; Bamfords, Ltd.; Harrison McGregor; Listers; Tudor Batteries, and others.

A very noteworthy feature of the exhibition was the strict classification of all the exhibits. This is very valuable from the purchaser's point of view, as it enables him to make direct comparisons; also from the maker's aspect, as it ensures that his exhibit will not be overlooked, as might be the case where exhibits are arranged by the makers instead of being classified with

Fig. 2.—Law Motor Driving Grindstone.

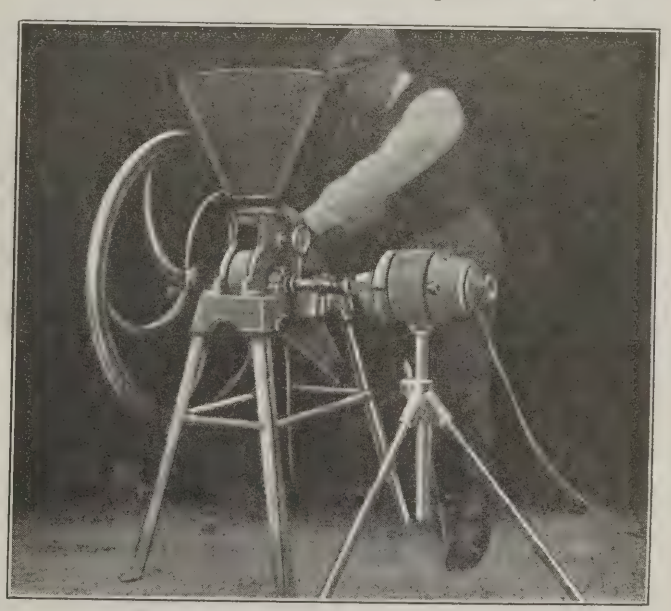

Fig. 3.—Law Motor Coupled to Oats Crusher.

the whole of the entries. The arrangement is the outcome of the experience of the general manager, Mr. Villard, who has made a point of visiting all the important British and Continental agricultural shows for the past 25 years.

Apart from the agricultural electric motor exhibit, the most interesting feature of the show was the huge combined reaping and threshing machines shown in operation by several American manufacturers; they were driven by electric motors, though in many

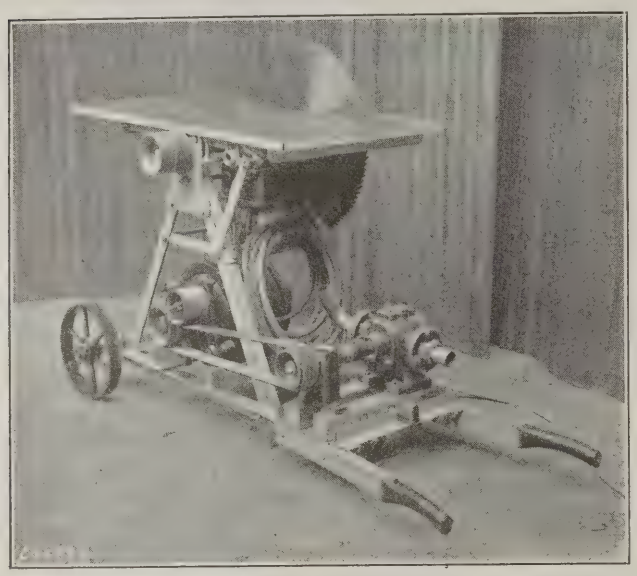

Fig. 4.— A "Fleno" Motor Outfit for driving a Saw and a Pump.

cases they would undoubtedly be operated by oil engines. These big machines are intended more particularly for use in the North of Africa and in parts of America where the grain is ripe and dry when cut, and also where straw is of little value and is discarded with the chaff on the field, to be ploughed in later on. The width of cut of such a machine is up to 15 ft., and it has a capacity of 25-30 acres per day while threshing out 125-150 quintals (440-530 bushels) of wheat. These machines are constructed entirely of metal, including the threshing portion.

tion. In addition to the public display at the exhibition, tests were carried out to demonstrate the portability of each complete motor-driven unit. The next stage will be the technical trials of the Paris Laboratoire Centrale d'Electricité, where the usual efficiency, temperature-rise, insulation, and other records will be made. Upon completion of this part of the work, the motors will be taken to an agricultural college, and on the farm they will be again tested under working conditions. The main points to which the judges will give consideration are: (1) The speed with which the equipment can be put into operation; (2) the brake h.p. available on the shaft of the driven machine; (3) safety in use for the farm labourers and the machines to be driven; (4) facility for transport; (5) facility for the substitution of the motor; (6) robustness; and (7) price. The motors are specified to be of the single- or 3-phase type in three sizes, which French experience has indicated as being most suitable for farm purposes, viz., 1.5, 3, and 5 h.p. The output is measured at the motor shaft as the basis of a one-hour rating. The competition is limited to French manufacturers, and the motors have to conform to the French National Standardisation Regulations. They are required to be delivered complete, ready for use, together with a standard length of flexible cable. The standard speed specified was 1,500 r.p.m. when running on no load, but speeds of 3,000 and 750 r.p.m. were permitted as alternatives. It was further specified that through reduction gears, speeds of 1,500, 300, 150, and 50 r.p.m. (with a tolerance of 10 per cent. less) were to be available on the shafts of the machines to be driven. The direction of rotation of the latter machines was specified to be clockwise.

The judges selected were representative of the Government departments concerned, the electrical industry, the rural electrification authorities, the agricultural machine builders, and agricultural bodies. The above particulars have been given in detail, as this is probably the first case of national competitive tests for agricultural electric motors.

Twelve manufacturers sent in about eighteen entries, the most novel of which was a motor of the Electromoteur Co., which had a similar appearance to a lathe headstock without back gearing, the armature being, of

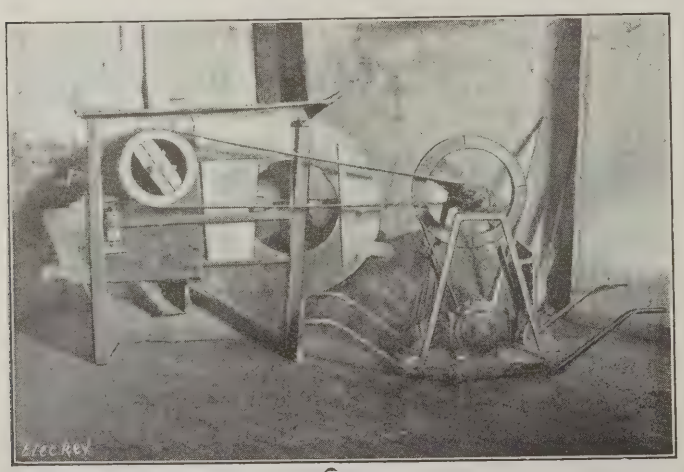

Fig. 5.—"Touchard" Gearing driving a Winnowing Machine.

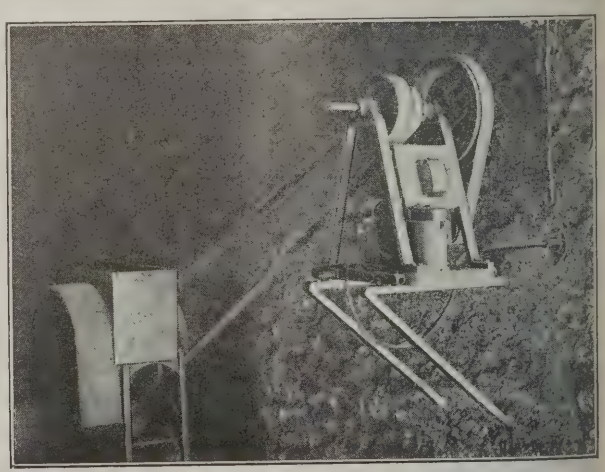

Fig. 6.—"Touchard" Gearing bracketed for Root-cutter Drive.

A novelty was a Fordson tractor, mounted on wheeled stilts. The object of this is to allow for the cultivation of high crops set out in line, such as sugar-cane, cotton and grape vines; the clearance under the body of the machine is nearly 4ft.

Turning now to the agricultural electric-motor display, it may be mentioned that this section will be repeated next year on a very much larger scale. Owing to limited time, only 12 manufacturers sent in entries. The object of the tests that are to be carried out is rather of a standardising nature than competitive, as no awards are to be made; it is to reassure the farmer that he can safely purchase any electric agricultural motor that has passed the tests of the Associa-

course, stationary, while the field, which was formed like five stepped pulleys, rotated.

The Société d'Electro-Motoculture de Carcassonne has always advocated the use of a single motor for all purposes on the farm. The motor it supplies is cylindrical in shape, without feet, but it is fitted with two convenient handles, and on to the frame of every machine that is to be driven, a special semi-circular bed is fitted to take the motor. In addition to the ingenious friction drive which this firm showed last year (Electrical Review, April 9th, 1926, p. 569), it has now introduced a special intermediary speed-reduction gear for use after the preliminary friction-drive speed reduction. This consists of two gear wheels,

the smaller of which is connected directly to a V-groove pulley; the machine itself is then driven off this pulley by means of a leather link belt. The writer has made some independent tests of this friction drive and found that the slip is excessive on large ratios of speed reduction; evidently the makers have come to the same conclusion—hence their adoption of this intermediate speed-reduction gear.

The "Law" portable ½-h.p. motor, which is mounted on a tubular tripod stand, fig. 1, is arranged for direct connection to barn machinery. A double reduction gear is incorporated within the motor frame. The motor starter and speed controller is incorporated in the end frame of the machine, and consists of a simple circular handle, which has merely to be turned to put the motor in operation, to change the speed and to reverse it. The tripod stand is of fixed rigid construction, but it is provided with a central vertical adjustable tubular support for the motor, so that the latter can be aligned to the machine to be driven. During last year 1,680 of these special agricultural-type motors were sold. Figs. 2, 3, and 4 show some applications for agricultural motors, and figs. 5 and 6 show the "Touchard" portable reduction gearing, which can be used with any standard motor.

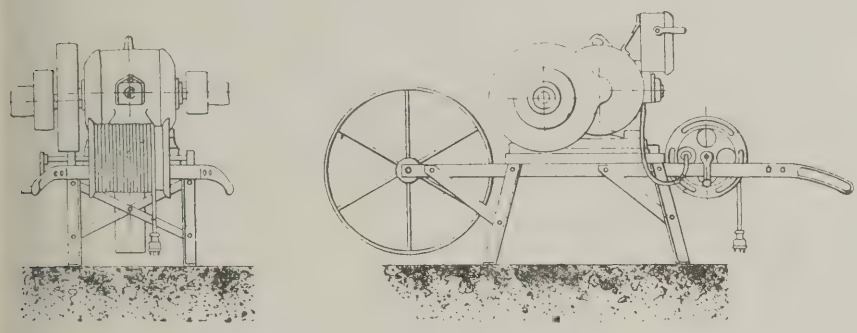

Fig. 7.—The "Patay" Reduction-geared Motor.

The "Patay" portable farm motor, fig. 7, was shown provided with a toothed reduction gear. The single-barrow wheel is so arranged as to be well clear of the ground when the motor is in use. The general design of the chassis of this set is typical of those of many French makes. Belt drive, with jockey pulleys, is the usual speed-reduction device.

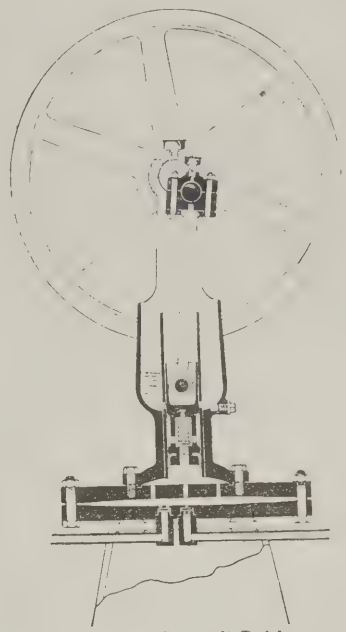

Fig. 8.—The "Corblin" Refrigerator.

Among the refrigerating machines was the "Corblin" diaphragm type, fig. 8. Several minor improvements have been made since last year. It is obvious that the use of a diaphragm entirely overcomes leakage of the substance (in this case ammonia), which is employed as a refrigerant. The "Corblin" machine is now made in domestic sizes.

(To be continued.)

What is it to Drive?

Some guiding suggestions for the user when choosing the motor and method of drive to be employed.

By ROBERT MARSDEN, M.M.A.E.

IT is useless to attempt to supply a motor unless you are in possession of the following information:—

1. The type and make of machine to be driven.
2. The load at starting.
3. The drive required.
4. Speed variation—if any.

If such information is not in your possession, it is always advisable to visit the prospective buyer, unless it is a question of long distance or export.

Knowing what machine is to be driven will undoubtedly smooth away most of the difficulties, but do not spoil the job by cutting the horse-power. You cannot expect the best life out of a motor which is compelled to run continually at its full output. Naturally, machine makers—out to sell their products—cut the horse-power to a minimum, leaving no safety margin. The best plan is to take the published horse-power and add about 20 per cent. to be sure of meeting all requirements. By doing this you will also allow for the "stiffness" inseparable from a new machine.

In the case of a direct-current supply, it can generally be assumed that a compound interpole motor will meet the essential requirements, as this type of motor will give a very high starting torque, and reasonable speed variation without commutation troubles, and deal with sudden changes of load in an excellent manner. Even if the starting is easy and no speed variation is required, should there be any danger of an erratic load, put in a compound interpole motor and be on the safe side.

In alternating-current work, however, a supply company has much more to say in your choice of a motor on account of starting conditions; therefore, if any doubt exists, see the company's representatives before making a decision. If no speed variation is wanted, you will do well to consider the new designs of high-torque squirrel-cage motors now on the market which, with approximately three times full-load current, will develop 200 per cent. of their running torque when starting. There is a wide field of possibilities open to this class of motor. These motors are now used for driving nearly every class of machinery which, prior

to their advent, had to have the slip-ring type. Another point in their favour is their cost, which is little more, if any, than that of the ordinary squirrel-cage type. All over the country to-day they are in use driving textile machinery, conveyors, cranes, hoists, pumps, &c., and they offer the finest driving facilities procurable.

Speed variation on an a.c. supply, with the exception of the a.c. commutator motor, is not so efficient as on a d.c. supply, but many very satisfactory equipments are in use, giving 50 per cent. variable reduction in motor speed by using resistance in the rotor of a slip-ring motor. It should be remembered that this 50 per cent. reduction corresponds to a 100 per cent. speed variation on the driven machine.

In cases where the saving of floor space has to be considered, if you cannot directly couple your motor, perhaps one of the best drives is by the jockey-pulley. By this means, an efficient drive can be obtained with even four-foot centres. There is this advantage with a belt: if it should break, it can be immediately replaced or repaired. An alternative method is by gear-driving, but unless it is very carefully designed and fitted, your motor pinion will require continual replacement. Under all circumstances, the motor base must be mechanically fastened to the frame of the machine being driven, otherwise "creeping" will take place with disastrous results. There are times, however, when, owing to structural details, it is not possible to introduce a gear. The chain drive is then clearly indicated.

Another important point for consideration is the neighbourhood and atmosphere in which the motor has to work. In chemical works, for instance, it is by far the best to have a totally enclosed machine, despite the extra cost involved, if there is any likelihood of dangerous gases attacking the insulation. When the motor has to work in the open, it is essential to specify "weatherproof," not merely "totally enclosed." Where inflammable or dangerous gases are liable to accumulate, *never take a risk*, it is much too vital a point to disregard—demand a flame-proof and explosion-proof motor.

In conclusion, it is well to remember that there exists no driving proposition which cannot be successfully accomplished electrically, provided the right motor is installed.

Sag Calculations for Power Transmission Lines.

A consideration of the requirements for Overhead Conductors under varying working conditions due to changes in temperature, wind pressure, ice covering, &c.

By WILLIAM T. TAYLOR, M.Inst.C.E., M.I.E.E.

(*Continued from page* 292.)

The values from which different charts may be plotted are given in the accompanying tables. That is to say, with reference to Table V only, we may:

(1) Plot curves for each size of conductor and for the more generally used stringing temperatures, in terms of span length and sag. In this way the values of sag for *any* span length are found.

(2) Plot curves for one size of conductor and for

TABLE II.—Sag in Plane of Resultant, corresponding to the Loading on Bare Hard-Drawn Copper (Solid) Conductors under the Electricity Commissioners' Rules.

Formula: $D = \frac{l^2 W}{8 P}$.

different temperature and loading values, in terms of span length and sag. In this way the values of sags for any span and for different temperatures are found.

(3) Plot curves for the size of conductor and one or more spans, in terms of sag and a full range of temperatures. As most lines often keep to one size of conductor and to one or two lengths of span, a curve of this nature should be found very useful (see fig. 1, p. 292).

(4) Plot sag curves for the spans used and for different temperatures, in terms of *all* sizes of conductor and sag values.

(5) Plot sag and tension curves for each size of conductor in terms of different loadings and different temperatures for different spans. In this way any intermediate value of sag and tension is found. (The tension values are obtained from the general formula: $P_1 = l^2 w / 8D'$ or $P_t = l^2 w / 8Dt$ where D' and D_t are the sag values given in Table V.)

Sags for the most severe weather conditions, which conditions are specified by the British Electricity Commissioners, are given in Table II for different sizes of conductor A, different spans l, and different tensions P. In the use of the parabolic equation, which is used herein, it is fortunate that, at the outset, the factors P, l and w are well established, so that the resulting sag D and the corresponding length L of conductor for spans up to about 800 ft. can be relied upon for accuracy.

The actual (or original) length of conductor, *i.e.*, the length of the parabolic curve, under the same conditions governing Table II, have been calculated for different sizes of conductor A, different spans l, and different sags D; these are given in Table III.

The most economical span-range for hard-drawn copper is under 850 ft.; therefore, up to this range, the values of L and L_0 given in Tables III and IV are almost as accurate as they would be if calculated from the catenary equation.* The values of L and D may also be plotted on one chart in terms of P for the different sizes, and the desired sag values for different temperatures and loading obtained just the same as with the "Thomas" chart. Or, if desired, we may divide the tabulated values for L, D and P by the respective spans l, and prepare a chart on the basis of a 1-ft. span for a 1-lb. per ft. length of conductor, which would serve for any material, size, weight, loading and span; or we may use the formulæ: $P = (1/8)\ (l^2 w / D) =$ (tension for unit span); and $L = l + (8/3)\ (D^2/l) =$ (length for unit span), which amounts to the same thing. We would thus have P, D and L values for unit span for any conductor material, weight, size, &c. These values, if plotted on logarithmic paper in terms of P for L and D, will give a straight line for L and a straight line for D values.

The next step in the calculations for sag is to determine the unstressed length of conductor in the span. In Table IV it is seen that if all the stress were removed from the conductor, the span would show, in a great many cases, a less length than the actual span length. For different sizes of conductor, different spans and different lengths L, values for the unstressed length L_0 at zero temperature (or datum) have been calculated; these values are given in Table IV.

Under the above-mentioned conditions the effect of temperature is not taken into account. If now we assume the temperature to rise t°F., then the length of the conductor—still without stress—would increase with the increase in temperature. For the different sizes A of conductor, different spans l, different temperatures t°F., and different lengths L_0, the values of L have been calculated.

* See Electrical Review, September 11th, 1925, giving sag calculations using the catenary equation.

(To be continued.)

The Centenary of Volta.

His Career and Important Inventions.

By T. B. FOWLER.

THE centenary of Alessandro Volta, whose name has been applied to the volt, the practical unit of electromotive force, occurs to-morrow. The event happily coincides with a period of rapid electrical development, which in this country is marked by the scheme for reorganising the whole of our electricity supply.

When he died, on March 5th, 1827, Volta had gone far towards solving phenomena which had mystified men for over two thousand years. Thales, one of the seven sages of Greece, was the first to discover the electrical properties of amber, as early as 640 B.C. Centuries passed before any notable advance in knowledge was achieved. Then William Gilbert, Queen Elizabeth's physician, found that other materials besides amber were capable of electrification by friction. A succession of developments paved the way for Volta's great discoveries. Galvani, in 1791, revealed some of the wonders of electricity and performed pioneer service of the utmost value; but poverty and disease prevented him from following up his discoveries, and it was left to Volta to elaborate the theory of current electricity along purely physical lines.

Volta, who came of an aristocratic family, was born at Como on February 18th, 1745. It was a time of upheaval in Europe, and Maria Theresa, of Austria, was prosecuting an ambitious war of conquest in Italy.

Invention of the Electrophorus.

Through the troubled and difficult years that followed the invasion, Volta's education proceeded to good purpose. His special aptitude for electrical discovery was manifested as early as 1769, when, a young man of twenty-four, he addressed a Latin dissertation to Beccaria, entitled "De Vi Attractiva Ignis Electrici," which is historically significant for the fact that it announced his earliest invention—the electrophorus.

In its essential simplicity it struck the keynote of the mental processes which Volta brought to bear in wresting from Nature the truth respecting her most secret operations. All that it consisted of was two circular metallic plates, between which was a round disk of resin, which was excited by being struck a number of times with either a silk kerchief or pieces of dry, warm fur or flannel.

In 1774 Volta was appointed to a professorship of physics in the gymnasium of his native town. Five years later, when a chair of physics was founded at Pavia, he became its first occupant. Journeys to Switzerland, France, Germany, Holland, and England enabled him to compare notes with some of the most advanced scientific thinkers of the day.

About 1782 he announced two more important discoveries. The first consisted of what he described as

an electrical condenser, an adaptation of the electrophorus by the substitution of a plate of marble or varnished wood for the disk of resin; the second disclosure was the existence of negative electricity in the vapour of water, the smoke of burning coals, and the gas produced by dissolving iron in weak sulphuric acid.

But the achievement which, above all others, entitles him to rank among the greatest scientific discoverers, was his demonstration of the development of electricity in metallic bodies, and the production of the "pile" which perpetuates his name. Here, again, the scientist presented a device capable of comprehension by those least versed in technicalities. His pile was constructed of an equal number of zinc and copper disks, alternating with circular plates of cloth, paper, or pasteboard soaked in dilute acid or salt water.

Demonstration Before Napoleon.

Thus Volta, in the words of Dr. Dickerson, gave to the world a new manifestation of electricity, presenting it in a form in which "this subtle agent is far more manageable than in the form of static electricity. By the use of galvanic batteries a current of low tension, but of enormously greater power, can be maintained with little difficulty, whereas static electricity is like lightning and readily leaps and escapes on the surfaces on which it is confined."

The discovery of the electric current appears to have been made a year or so after Volta's marriage, which took place in 1794, but it was not announced until March 20th, 1800, when Volta communicated the facts in a letter to Sir Joseph Banks, who conveyed the news to the Royal Society. Volta had been awarded the Copley Medal in 1791, and further distinctions were conferred upon him in 1801, when he demonstrated his theories and conclusions before the members of the National French Institute.

Among those who attended the lectures was the First Consul, Napoleon, who was quick to perceive the importance of Volta's discoveries. On his initiative a gold medal was struck in Volta's honour. Napoleon added a gift of 6,000 francs and the Cross of the Legion of Honour. Volta was elevated to the dignity of a senatorship of the kingdom of Lombardy, and in 1815 the Emperor of Austria appointed him to the directorate of the Philosophical Faculty of Padua.

Napoleon had been specially impressed by Volta's experiments in the electrochemical decomposition of water, and it is an interesting fact that, as an outcome of the physicist's visit to Paris, a commission, which included such eminent scientists as Laplace, Coulomb, Halle, Fourcroy, Brisson, Sabathier, and Biot, was appointed to repeat his experiments on a large scale.

Volta was as industrious as he was ingenious, and his active career was marked by an almost unbroken succession of discoveries. Apart from those already indicated, his gifts to science included a device for testing the amount of oxygen in the air; he was responsible for much useful exploratory work as regards heat and gases; and he is credited with being the first to entertain the idea of an electric telegraph.

In support of this claim, Sir Francis Ronalds refers, in a letter, to an autograph manuscript wherein Volta states that he does not doubt the possibility of exploding his "electrical pistol" at Milan through wires supported by posts whenever he discharges a powerful Leyden jar at Como.

Knowledge for the Sake of Knowledge.

Volta combined with acute intelligence and clear insight, lofty ideas and transparent sincerity, the rarest personal modesty. He is described by those who knew him as being entirely free alike from ambition, thirst for wealth, or jealousy. He pursued knowledge for the sake of knowledge alone.

Scattered throughout the letters and memoirs which he accumulated was a wealth of informative detail respecting his researches, but he shrank from publicity, and it never occurred to him to embody the material in book form.

It needed Faraday's discovery of the induction of electric currents, and the creation of currents by the motion of conductors in magnetic fields, to open up the era of modern electrotechnics, but Faraday himself generously and ungrudgingly acknowledged the debt of obligation which science owed to Volta for the removal of what he described as "doubtful knowledge."

"Such knowledge," he declared, "is the early morning light of every advancing science, and is essential to its development, but the man who is engaged in dispelling that which is deceptive in it, and revealing more clearly that which is true, is as useful in his place, and as necessary to the general progress of science, as he who first broke through the intellectual darkness and opened a path into knowledge before unknown."

Volta spent his last years in retirement at Como, and there, amidst the friends and scenes he loved best of all, a great, simple-minded and affectionate man, and an earnest student to the last, he passed away at the advanced age of eighty-two.

The Factor's Catalogue.

Some aspects of a field of publicity work which is little exploited.

By A. J. SMITH.

THE majority of manufacturers appreciate to a greater or less degree the important *rôle* of the catalogue in sales promotion work, but in many cases it is not so fully appreciated that the publication of the maker's own lists does not exhaust the possibilities for effective publicity in this line, for there still remains the large number of catalogues issued by wholesalers, factors, or export merchants in which are embodied details of various manufacturers' productions, many of which have a circulation as wide as that enjoyed by the makers' own sales literature. It is seldom indeed, that the edition of any catalogue is less than four or five thousand copies, while the amount of care used in its distribution is usually precisely in proportion to its cost. Broadly speaking, space in a factor's catalogue of any kind is only a shade inferior in value to the maker's own lists and in estimating its value it is interesting to note that in certain trades, notably in the radio industry, there are one or two wholesalers' catalogues which are frequently preserved and used by buyers in preference to the lists of the actual makers,

on account of the better arrangement and classification, as well as the more varied range of information which they contain. The important point in connection with all such extraneous publicity is that if an article is once included in a factor's catalogue of any kind, orders are bound to follow sooner or later. It might be thought therefore that there would be very considerable competition on the part of makers generally to secure representation in such a work, but this is by no means the case. Far from being bombarded with offers from makers to collaborate in every conceivable way in the preparation of his sales literature, the average factor or merchant in any line has to extract details piecemeal by dint of much hard work from apparently indifferent or hard-pressed makers. Copies of the latter's standard sales literature are usually obtainable without much trouble, but if special information or additional details are required, it is quite a different matter. On the question of the loan of blocks or electros, it is surprising how many are the manufacturers who consider that they should be paid for these, and if a block should ever be required of a special size, or without the maker's name or trade-mark appearing, there are yet greater difficulties, and the maker's "take it or leave it" attitude becomes still more pronounced. There are in fact cases where makers have declared that they would not dream of allowing an illustration to be published of any product of theirs which did not bear their name! In the compilation of an export catalogue, it is often possible to waste weeks if not months in the endeavour to obtain a list of standard sizes and prices from some maker whose motto is "Prices and Particulars upon Application." Fortunately, however, it is usually possible to find a competing maker who is a little more complaisant or farsighted as to the ultimate possibilities, and who consequently gets his own productions listed, while the other is left to point to the coal strike, the unsettled state of export markets, or some equally plausible reason as an explanation of lack of business. In such a trade as radio, for instance, one may come across instances of important wholesalers' catalogues being held up for a couple of months at the critical time of the commencement of the winter season owing to the failure of manufacturers to supply details of their new models in good time.

Although practice differs from trade to trade, there are one or two general considerations which require to be borne in mind by the manufacturer who wishes to obtain adequate representation in a wide range of different factors' and wholesalers' catalogues. In many trades where the merchant's position is not very clearly defined, it is practically an essential condition that the block used must not show the maker's name or trade-mark. If the factor's position is at all ambiguous, it is obviously not good policy for him to show who are the actual makers of the goods listed. The provision of plain blocks, or the offer to provide them upon request will often be a considerable "pull" in securing representation in any pages of this kind, as will also the offer to provide blocks of a size to suit the pages for which they are to be used.

In the majority of lines listed, the average factor naturally prefers an illustration showing a conventional type of article which may fairly be held to represent general practice, in preference to illustrating something of special or unconventional design, which in case of business can only be obtained from one source. Obviously it is very desirable that a factor should have alternative sources of supply in case of unexpected increases of price, or inability to obtain reasonable delivery, and it is considerations of this nature which usually render necessary a great amount of sub-editing of the manufacturer's descriptive matter and the deletion of many selling points which may distinguish a particular article from others of its class, so that the resulting description is in such general terms that it may apply equally well to several different makes. But in spite of all sub-editing due to such considerations, the maker whose article is illustrated and whose description is adopted retains a decided advantage when it comes to filling orders which may have resulted from a distribution of the catalogue.

The time or trouble which may be necessary to get one's products listed in merchants' catalogues is well-spent, though the value of the work is apt to be disregarded as the securing of an order is not the *immediate* result; but though the primary result is propaganda space only, the writer has never yet encountered a case of the listing of goods in factors' catalogues which did not result in orders sooner or later. In fact in certain lines of engineering goods, where patterns are standardised and designs change but little from year to year, the useful effect of an appearance in a substantial catalogue is enormous, and the writer has traced business coming along regularly for periods of fifteen years and over as a consequence of a particularly well-compiled catalogue of this description.

The essentials which require to be borne in mind by the maker who desires his products to be widely listed by merchants and wholesalers are generally:—(1) He must be prepared to supply blocks without any name appearing; (2) they must be of a suitable size for the publication for which they are intended; (3) the descriptive matter should be drawn up to follow the general plan of the catalogue for which it is intended, and of the exact length to fill the space which can be alloted without sub-editing; and (4) the particulars require to be drawn up with the same care and the same promptitude as would be used in the case of the maker's own lists. There are few factors who would not appreciate attention upon these lines. In fact, it only requires some little experience of the results which can follow a more progressive policy with regard to this type of propaganda to show that there exists here a field for indirect salesmanship which though comparatively little cultivated, is yet capable of bringing in remunerative results spread over long periods.

Supervisory Traffic Control for Hudson Tunnel.

An electrical protective system, based on the supervisory control system developed for railway and power stations and modified to meet the particular local conditions, will ensure safety in the Holland vehicular tunnel between New York and New Jersey, U.S.A. An order totalling half a million dollars for the necessary equipment has been awarded by Messrs. Fischback and Moore, electrical contractors, to the Westinghouse Electric and Manufacturing Co. Three kinds of traffic signals will direct motorists using the tunnel: green for "go ahead"; red for "stop," and a special "stop-engine" signal. These lights will be spaced 240 ft. apart; traffic officers every 480 ft. will patrol the tunnel, and for each there will be a traffic-light control station and a telephone. A board located in the administration building in New York and carrying 926 pilot lamps will inform a central operator of everything going on within the tunnel, and will enable him to stop traffic at any desired point, and he only can reset the signals. The pilot-light board in the control room will show, in addition to the position of the traffic lights, definite signals indicating the state and speed of every piece of ventilating apparatus and the conditions of every circuit serving the tunnel. If anything fails, a bell will ring, and a bright light will indicate the location and character of the trouble. When everything is in good order, the pilot lights will burn dimly, so that a bright light will instantly attract attention. The 84 ventilating fans will be on six independent circuits. Normally the power supply will be divided between New York and New Jersey, but any piece of apparatus can be supplied from any source the operator desires, and all switchgear is to be interlocked. The tunnel will be illuminated by lamps spaced every 20 ft., except at the entrances, where they are spaced every 10 ft. to help in counteracting daylight. The tunnel will be opened to traffic early in the summer of 1927.

The Accumulator Makers' Association.

Third Annual Dinner in London.

THE annual dinner of the Accumulator Makers' Association was held at the Savoy Hotel in London on February 21st, Mr. B. M. Drake presiding over a company numbering about 200.

The loyal toast having been honoured, "The Accumulator Makers' Association" was toasted by Mr. J. S. Highfield, who remarked that the public's impression that the function of associations was price arrangement was quite wrong; they enabled resources to be pooled, so that business could be built up securely, and were not "trusts," as they kept up competition. They had a right to the profit they made, otherwise they would have no resources wherewith to back up progress, and, moreover, profit was a standard whereby efficiency could be gauged.

Mr. B. M. Drake, in reply, claimed that the Association had benefited all concerned. The industry was now in a flourishing condition and able to hold its own at home and in foreign markets, too, in spite of the fact that protection did not exist in this country as it did abroad. Last year the value of exports reached £871,000, whereas imports were only valued at £53, which figures showed that they were not abusing their position, or overcharging for their goods. He welcomed the publicity which the electrical industry had obtained during the passage of the Electricity (Supply) Bill through Parliament, as it could not fail to benefit all branches, including that of accumulator manufacture. Some doubt had been expressed as to the effect on the accumulator trade of the spread of alternating current, but, in spite of the undoubted fact that many had held back their orders last year owing to uncertainty as to the final form the Bill might take, it was satisfactory to be able to record that the output of accumulators had actually increased during that period. When electric light was introduced timid shareholders hastened to sell their gas shares, but the very utility of an appliance invited the appearance of a competing alternative, and two good alternatives always benefited each other. Only a small proportion of the population was at present using electric light and power, and the extension which was expected to follow the widespread network of mains would so popularise electricity that many who were not within reach of them would consider themselves behind the times if they did not purchase private plant, of which an accumulator formed an essential part in order to obtain security, steadiness, and economical working of the engine. In a.c. generating stations there was a growing market for emergency batteries to light the buildings when a breakdown occurred, in which respect they were following the lead of America, where large emergency batteries had proved their utility. The serious losses which would occur in works if the electricity supply failed would justify the use of accumulators as an insurance against breakdown, and in hospital operating theatres and for other vital services accumulators might well be made compulsory. He looked with confidence to the future of the accumulator industry.

Mr. D. P. Dunne, in proposing "The Electrical Industry and the Guests," referred to the talk heard on every hand of a coming revival of trade; the best augury was the fact that the people were looking for it, they expected it. In addition, the Electricity (Supply) Act, designed to stimulate the public, had been passed with progressive notions for fostering the use of electricity. However, the industry did not consist solely of the generating stations, and they must not depend too much on the Act alone, for an Act that was not put into operation properly became destructive. Development would, therefore, depend upon the efforts that were put forward from within the industry itself, but they still had to contend with competition from abroad, and the greater their own efforts were the greater would competition be.

Sir Duncan Watson, in responding, intimated that the Central Electricity Board and the Electricity Commissioners would welcome suggestions for improving load factor, because doubling the l.f. would halve the cost. He considered it pertinent to remind the assembly that four years ago the all-electric house was a dream; to-day it was a practical reality, and it had come to stay, and if they progressed on those lines this would be a happier and more prosperous country in future than it had been in the past. No better chairman of the Board than the one chosen could have been found to solve a very tangled scheme; the Board's composition and the manner in which it had been received indicated that the Government meant business. The electrical Press, which had always been independent, had not been afraid to say what it thought and to give credit where it was due. He hoped the industry would close up its ranks and render that assistance to the Board which it so much needed.

Mr. J. W. Beauchamp also replied to the toast, pointing out how representative of the electrical industry was that night's gathering.

In addition to the much appreciated songs of Miss Edith Furmedge and Mr. Thorpe Bates, accompanied by Mr. G. H. Ison, the band of the Royal Regiment of Artillery rendered a programme of music which added to the enjoyment of the evening.

Legal.

Wareham Electric Supply Co., Ltd.

Allegations of Fraud.

In the Companies' Winding-up Court, on February 22nd, Mr. Justice Romer had before him, as briefly mentioned in our "Business Notices" last week, the petition of Mr. W. E. Weston, of Spring Grove Road, Hounslow, a shareholder, for an order for the compulsory winding-up of the above company.

Mr. C. A. Bennett, K.C., who appeared for the company, said the petition was by a gentleman who, in one part of his petition, said he was a fully-paid shareholder, and in another that he had repudiated the allotment of the shares to him. The petition was one of the longest he had ever seen—it contained 68 paragraphs—and throughout it made charges of fraud against those concerned in the management of the company. He was going to ask his Lordship to say that the statutory affidavit should not be regarded as sufficient, but that the allegations should be properly verified by another affidavit.

His Lordship: Where is the fraud alleged in the petition?

Mr. Bennett: It is alleged throughout.

His Lordship: I see in one paragraph it says "the said shares were created in fraud of," &c.

Mr. Bennett said in another paragraph it was stated that there was "deliberately withheld from your petitioner all such material facts and information in order to mislead and deceive your petitioner and others who might be induced to apply for shares or debentures in response to the said prospectus."

His Lordship: Is the company in voluntary liquidation?

Mr. Bennett said the petition in one place alleged that it was, and in another that an order was made in the Dorsetshire County Court staying the voluntary liquidation. The conclusion seemed to be that the company was still in voluntary liquidation. It was impossible, he thought, from the petition to understand what the petitioner's real case was against the company.

Mr. R. J. Willis, for the petitioner, said this was a serious case, and the facts were somewhat unusual. According to the petition there was very gross fraud by those concerned with the company.

His Lordship: You had better file proper evidence in a detailed affidavit. Is the company still carrying on business?

Mr. Willis said that only in the last day or two one of the directors of the company had sent out a circular to the shareholders of this and four other companies suggesting that some trust should be formed.

Mr. Galbraith, K.C., said he appeared for the liquidator, whose duties were supposed to have come to an end in 1923, when the voluntary winding-up was stayed. What he wanted to know was whether he was still liquidator or what had happened.

Mr. Willis: I say the company is still in voluntary liquidation, but it may not think so.

His Lordship adjourned the petition for 14 days for the filing of further evidence, and said that in the meantime the company would deal with the assets only at its peril.

Montreal Tramways and Power Co., Ltd.

Mr. Justice Romer, in the Chancery Division on February 22nd, sanctioned a scheme of arrangement of the finances of this company.

Mr. Linden, for the company, said it was entirely controlled by a board in Canada, and most of the shareholders were there. The scheme was in reality a reconstruction. The company was registered here and the scheme provided for shares of a Canadian company, called the Montreal Tramways Co., to be issued to the liquidator of the present company, and for the Canadian company to take over its liabilities and pay for the winding up. The scheme also provided for a reduction of capital, as according to the laws of Quebec it was liable for taxation on the amount of its actual capital and at the same time to taxation here

British Thomson-Houston Co., Ltd., v. Mullard Radio Valve Co., Ltd.

A motion by the British Thomson-Houston Co., Ltd., against the Mullard Radio Valve Co., Ltd., was mentioned to Mr. Justice Tomlin in the Chancery Division, on February 25th.

Mr. Whitehead, K.C., for the plaintiff company, said the motion was for an injunction to restrain the alleged infringement by the defendant company of certain patents. It had been adjourned until that day to enable the defendant company to answer his affidavit, and it was a term of the adjournment that the defendant company would let his clients have the affidavits in answer by February 23rd. The defendant company was unable to let him have two of those affidavits until February 24th, and those affidavits he (Counsel) wished to

answer. But there were certain negotiations proceeding between the parties, and he hoped that if his Lordship would allow the motion to stand over for 14 days it might be possible to dispose of the whole matter without its coming into Court.

Mr. R. Moritz, K.C., for the defendant company, said, without prejudice to the position which he took up that the motion was wholly misconceived and ought never to have been brought, he had no objection to the adjournment asked for.

His Lordship granted a further adjournment, and said that Mr. Moritz's statement would not interfere with anything which he might say on behalf of the defendant company when the motion came on again.

Birmingham District Power and Traction Co.

Corporation Profits Tax Appeal.

In the Court of Appeal on February 23rd the appeal of the Birmingham District Power and Traction Co. from a decision in favour of the Income Tax Commissioners, given in the King's Bench Division by Mr. Justice Rowlatt, was allowed. The company claimed that its profits and those of three omnibus companies which it owned should be assessed for corporation profits tax together. In this case two years' exemption could be claimed under the Act as the company was a public utility company, while it lost £1,500 in exemptions (£500 for each subsidiary).

Costs of Opposition to Dublin Electricity Bills.

In the High Court, Dublin, recently, the Dublin Corporation and the Liffey Syndicate, Ltd., applied for liberty to plead in defence of an action brought against them by Col. R. C. Cane that a Parliamentary Committee which awarded costs to Col. Cane in respect of his opposition to electricity supply Bills promoted by the defendants was acting *ultra vires* and was not lawfully constituted. The judges held that the application of the Liffey Syndicate, Ltd., should be refused, but they gave the Corporation liberty to plead, as the preamble of its Bill was proved, although the Bill was subsequently withdrawn.

An Unlicensed Transmitter.

On February 18th, Eustace Dennes, electrician, Chorlton-cum-Hardy, was charged with working a radio transmitting station without a licence. It was stated that the defendant had used another's call sign; he admitted working the station. A fine of £10 was imposed.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

The Electricity Board.

On February 22nd, Mr. Montagu asked the Minister of Transport whether members of the Electricity Board, apart from the chairman, could hold other lucrative posts or retain separate commercial interests.

Colonel Ashley said that the answer was in the affirmative. None of the members of the Central Electricity Board, other than the Chairman, was required by his appointment to devote the whole of his time to the performance of his duties as a member of the Board. Under Section 1 (4) of the Electricity (Supply) Act, 1926, however, a member of the Board, if interested in any company with which the Board had, or proposed to make, any contract must disclose to the Board the fact and nature of his interest, and might take no part in any deliberation or decision of the Board relating to such contract.

Broadcasting.

On February 22nd, the Prime Minister informed Captain Fraser that he could not give an opportunity for a debate on the question of the broadcasting of the proceedings of the House of Commons. He also was not prepared to set up a Select Committee, as he was unaware of any change of opinion on the question of broadcasting Parliamentary debates

Mr. Day asked the Postmaster-General if he could state the number of licensed wireless listeners in Great Britain on the last convenient date, together with the comparative figures for Germany, Sweden, Denmark, Hungary, Switzerland, and the United States.

Sir W. Mitchell-Thomson said that the latest available figures which were properly comparable were those for December 1st, 1926, *viz.*:—

Great Britain and Northern Ireland	2,130,000
Germany	1,337,122
Sweden	238,000
Denmark	114,492
Hungary	53,070
Switzerland	51,750

There was no licensing system in the United States, and no official statistics of the number of wireless receiving stations were available.

The North Metropolitan Bill.

The Times states that the Bill to raise £2,250,000 new share and loan capital which has been introduced into the House of Lords by the North Metropolitan Electric Power Supply Company will proceed as an unopposed measure through that House.

The National Association of Supervising Electricians.

Annual Dinner.

On Saturday last the annual dinner of the N.A.S.E. was held at the Holborn Restaurant, the president, Mr. A. M. Sillar, M.Inst.C.E., occupying the chair.

After the loyal toast, Mr. W. E. Highfield, M.I.E.E., proposed "The Guests," ascribing the success of the Association largely to those who came to its banquets and meetings. Mr. F. Palmer, President Inst.C.E., who responded, expressed the cordial goodwill of the Institution towards the Association. Mr. W. W. Lackie, C.B.E., Electricity Commissioner, also responded, and undertook to prove that all the guests were "supervising electricians." He warmly commended the work of the Association in connection with the I.E.E. Wiring Rules, pointing out that no body of men could know better what wiring rules should be.

Sir R. Burton Chadwick, M.P., proposed "The Association," which he described as a body representing trade unionism at its best. The campaign in favour of industrial peace that was in progress dealt with the dominant factor in our national life: since the Armistice we had lost more money and time than all other industrial countries together. Unless the people of this country realised the complete interdependence of capital and labour the outlook would be black. The Association exercised an immense influence in favour of sane trade-union leadership; next year it would dine under a new title.

Mr. Sillar, responding, said the term "electrician" was honoured in the early days, but in 1889 the Society of Telegraph Engineers and Electricians became the Institution of Electrical Engineers; the Association was adopting the title "Association of Supervising Electrical Engineers," which was more in accordance with the duties performed by its members.

Mr. Alan Kirk, A.M.I.E.E., chairman of the N.A.S.E., also responding, said that membership of the Association was now recognised as a hall-mark of professional efficiency; as a non-political trade union with the highest ideals, it provided numerous benefits for its members. Last year it experienced a most trying time, but came through without a wry word, thanks to the leadership of Mr. E. North and the loyal support of the Board and the members, and to the guidance of the general secretary, Mr. A. Brammer. Their position in the industry was now recognised; a suggestion that an abridged version of the I.E.E. Rules should be prepared had been referred to the Association and the E.C.A. in collaboration. The name of the Association would be changed on April 1st, and the scope of membership would be enlarged to include the commercial electrical engineers. He proposed the health of the first Board of Control, of 1914, and Mr. Stiling responded, describing the early struggles out of which the Association came into being.

Mr. E. North, M.J.Inst.E., proposed "The Industry," for which, he said, the prospects were now bright, provided that every man did his best; they needed initiative, economy, and efficiency—and less preaching.

Col. R. K. Morcom, C.B.E., chairman of the B.E.A.M.A., responded, forecasting victories for the close association of science and practice, and deprecating the too-common tendency to depreciate our national achievements, a result of the mixed thinking which pervaded politics and fed on statistics and catchwords If all did their best to make good the losses of war and the losses of peace, the future of the industry would be a rosy one.

Mr. J. S. Highfield, M.I.E.E., after expressing the desire of the past-presidents (who were all present except Mr. A. P. Trotter) to help and advise the Association at all times, proposed the health of the general secretary, which received musical honours. Mr. Brammer, in acknowledgment, attributed the success of the Association to the loyal support of the presidents and past-presidents, backed up by the yeoman service of the Boards of Control, and said the Association was now composed of men who had the right to call themselves supervising electrical engineers.

The speeches were interspersed with music and song, and the evening was thoroughly enjoyed.

Reviews.

Condensing Plant. By R. J. Kaula and I. V. Robinson. Pp. xiii+400; figs. 245. London: Sir Isaac Pitman and Sons, Ltd. Price, 30s. net.

While the reciprocating steam engine held the field, condenser design remained more or less stagnant, for this form of prime mover could not effectively utilise a higher vacuum than about 26 in. Hg. This degree of vacuum was easily obtained. With the advent of the steam turbine it became apparent that this new prime mover could effectively utilise much higher vacuum. The realisation of the thermal gain to be achieved by exhausting to a higher vacuum caused attention to be directed to the design of condensing plants. Numerous workers attacked the various problems concerned, but the results of their work, when published at all, were more or less in the form of studies of individual factors affecting condensation, and were scattered among papers to technical institutions, and in the various technical journals. It is only recently that any attempt has been made to collect the scattered data, co-ordinate the same in the light of modern experience, and present the result as a co-ordinated whole affecting condenser design and operation.

From being a cast-iron box stuffed full of tubes, located in any odd place, the condenser has risen in importance, until now it ranks with the boilers and turbines. Power plant sites are largely determined by the facilities offered for condensing purposes.

The authors have set out to treat the subject from the standpoint of the user as well as that of the designer and student. This standpoint is a commendable one, for the number of users is greater than that of designers, and also probably their need is greater. It may be said at the outset, that the volume under review is a notable contribution to the literature on condensing plant, and affords all who are interested an opportunity of becoming acquainted with the essentials of design and operation, and with the latest developments in condenser-plant practice, for the most recent improvements are included and given adequate notice.

After a brief summary of the various types of condensing plant, the effect of vacuum on turbine economy is discussed. The fact that there is an optimum value for vacuum, for given circumstances, is brought out. The authors do not mention that the thermal gain realised depends to a large extent upon the design of the exhaust stages of the turbine, and further that the actual gain at turbine full load rapidly falls away from that theoretically possible after about 28.5 in. Hg vacuum has been reached. Until the advent of bleeding for feed heating, the optimum thermal efficiency at full load was reached with about 28.9 in. Hg vacuum, even for turbines having a double-flow low-pressure cylinder. At higher vacuum the loss of heat from the condensate outbalanced the gain in steam consumption, for the actual gain in steam consumption below this degree of vacuum is very slight indeed. The advent of bleeding extended the optimum value. Chapter 3 gives in detail the calculations necessary for estimating the quantity of circulating water, and gives values commonly used in modern practice.

Eight chapters are then devoted to surface condensers, starting with the principles of design, following on with an exhaustive examination of the various factors influencing design and operation, and finishing with detailed illustrated descriptions of typical designs of leading makers in this country and abroad. An examination of the various tube plate diagrams of modern designs, shows that designers have all realised the vital importance of presenting the maximum possible cooling surface at the entrance to the condenser, with adequate tube spacing at this point, in conjunction with an entrance of adequate size and shape to render available the maximum amount of cooling surface at the entrance. The reviewer remembers a case years ago, where putting an augmentor steam jet in series with the piston air pump, increased the vacuum at the bottom of the condenser by about 0.5 in. Hg, but the vacuum at the top of the condenser remained practically the same as it was before the jet was on! This was one of the first condensers made for high vacuum (29.1 in. Hg), and the effect of steam friction through the tubes had been overlooked when the tube pitch was settled. Happily such things are no more.

Corrosion, erosion, and tube cleaning are next covered, then come chapters devoted to evaporative condensers, jet condensers of the high and low level type, and ejector jet condensers. The various ordinary and special forms of each type are described, and the relative advantages and disadvantages of each type adequately discussed. It appears to the reviewer that these chapters would have been better placed at the start of the volume.

Eight chapters are then devoted to air pumps. It may be truly said that air-pump performance dominates condenser performance, for a good condenser performance cannot be achieved without a good air-pump performance. Much useless ingenuity has been expended in trying to do with condenser design what can only be done by air pumps. With the advent of high vacuum the limitations of the reciprocating type of pump became apparent. Various expedients were tried to overcome these limitations, the most successful probably being the steam jet augmentor of Sir Charles Parsons. As a matter of fact, a good piston pump with a steam jet augmentor in series will give as good air-pump performance as any modern form of air pump. The limitations of the piston pump led to the development of rotary hydraulic pumps, which proved good from the vacuum production view, but took more power than the piston pump. Then came the development of the steam jet extractor type, the practical advantages of which greatly outweigh any theoretical disadvantage, such as degradation of high-grade heat in an auxiliary, and to-day it is established—and in the reviewer's opinion quite rightly so—as the best form of air pump. The authors' treatment of the various types of air pumps is comprehensive, thorough and unbiased, and will be of great value to operating engineers. The authors devote the necessary attention to adequate provision of air cooling. There is a typographical error on page 231, where fig. 109 is referred to in the text instead of fig. 112.

The book concludes with useful chapters on testing, de-aerating, and closed feed systems. The treatment throughout is thorough, sound, and unbiased. The volume is an attractive one from every point of view—save one—and that is the price. This appears to be on the high side, which is to be regretted, as it may restrict the field of a good book.

J. N. Waite.

Engineering Factory Supplies. By W. J. Hiscox. Pp. viii+176; 49 diagrams. London: Sir Isaac Pitman & Sons, Ltd. Price, 5s. net.

"The subject matter of this work is the purchase, receipt, storage, and distribution of factory supplies." To most people engaged in industry, this is not a thrilling subject. It follows that if it is to make an appeal it should first of all be readable. But this book suffers, as do so many technical text books, from the lack of an attractive style.

Everybody who is engaged directly or indirectly upon the transformation of raw materials into finished goods in all the multitude of factories throughout the land, should have a sound knowledge of the methods and means of handling the material. It appears to be the author's object to produce a standard text-book that everybody concerned can read. Surely, if it were easily read, it would attract very many searchers for knowledge and guidance. Perhaps, it is too much to expect that those who have the experience should also have the faculty of clear expression. The author certainly has the experience. Now, if the would-be author of the technical text-book, who does not possess the power of expression, would but collaborate with one who is able to write with an attractive style, both the reader and the author himself would benefit vastly. Thus, we must begin this review by exhorting those who have a desire to study this subject to struggle on, neglecting some of the details and shutting their eyes to some of the phraseology which is not helpful, so that they may pick out just those points that matter.

There is a great deal that does matter in the book. The trials and troubles of pilfered stock, late delivery, inefficient production, and lack of fluid capital, can more often than not be traced to the slack methods adopted in so many factories to deal with material supplies. Either there is lack of co-ordination between production, purchasing, storage, and distribution, or the storage of material is looked upon as a very minor function of the business, or, again, there is a distinct absence of that control of stock which is so essential to efficient production.

If one could assess the time lost, the penalties incurred, the deterioration of stock, and the loss of profit due to overstocking in terms of money, the country would be appalled at the waste thus accounted for. One of the prime causes of bankruptcy is undoubtedly overstocking. It is time such a cause were made a criminal offence. It is so unfair to the up-to-date manufacturer, after exercising due control over his own stocks, to have to write off huge sums annually for bad debts, when these debts become cancelled owing to the slack methods of his customers.

In order to avoid overstocking, it is necessary to set very fine limits for the maximum stock to be carried of each line kept in store. The trouble of late delivery is often caused through inattention to minimum stock levels, but of equal, if not greater importance, is the setting of the maximum levels. Even where they have been set, they usually have a large factor of safety, and that factor of safety is the means of tying up big sums of money, which, particularly in these times of financial stringency, are needed as much as liquid capital. Without maximum stock levels, scientifically based, the stocks which do actually grow up are those which are rarely or never used, and which in time, owing to changed demand, never will be used. When this happens, and it is happening in very many factories, wholesale scrapping, or sales at ridiculous prices take place. It depends upon the magnitude of this overstocking in any one factory whether it results merely in a diminution of profits or whether insolvency follows in its wake.

Mr. Hiscox tells us, if not all, a great deal about minimum levels, but he is sadly reticent concerning the maxima. At least half the problem of instituting thoroughly useful stock records centres around the calculation of really sound maximum stock levels.

Then, again, the days of the old card index, whether it be for stock or any other records, are passing. A manager, for instance, has not the time to look through hundreds of hidden cards to find out what he wants to know. He needs a visible record which *tells* him the position at a glance. If he is to

be interested in the stock, as it is most important he should be, the stores organiser must provide him with a picture of the stock rather than a stodgy book about it. The manager must be provided with something that will tell him in an instant what is right and what is wrong. There are several types of visible stock records on the market. Certainly they are more expensive than card indexes, but the ratio of useful service to investment cost is the important, and should be the deciding, factor.

We have not been greatly helped by the index to this work. It has failed to show us where to look for just those points we find most interesting, points that are included in the text. This lack of sufficient indexing is another fault of so many technical books.

There are 41 diagrams. We have seen better forms, but it is, we realise, difficult to include forms that will apply generally, and these can only be regarded as specimens of what might be used. Some of the methods advocated do not appear to be the least expensive compatible with economical working, and that is the acid test of any system. The author neglects to mention the advantages to be gained from the use of certain modern office machines which do facilitate clerical labour.

In introducing any system into a factory, there is always the tendency to over-elaborate the methods employed. It is so easy to get just a little more information than is actually required by the extension of a form, or the introduction of a further record. But it must be remembered that the larger the form or the number of records, the greater is the amount of clerical labour required to deal with them. The test to be applied is whether the purpose served or the added control acquired by such extensions of the system will fully compensate for the extra time needed in factory and office in handling the extra information. It is not enough to say, "This information can easily be obtained, if it is wanted." It is necessary also to show that the service given corresponds with the effort made. An authoritative text book should demonstrate the relative time required and utility gained by each step advocated or suggested.

The following are the main points dealt with by Mr. Hiscox:—The necessity for efficient handling of material; what to stock and who decides; the buyer, his duties, and his relation to other executives; purchasing for stock and for special requirements; receiving, checking, inspecting, and distributing supplies; circulating information regarding stores; the location and layout of storage space; the kinds of stores required and how each is sectionalised; the status of the storekeeper; methods of storing; transport of supplies; records and accounts; errors, and dealing with empties.

The subjects are treated fairly thoroughly and in logical order; the relation of the various people who have to deal with material before and after it is purchased, and their relation to others in the factory, are leading themes throughout the book. A close study of the chapter on errors and how they may be detected, will be of use to all who have to organise stores.

The severity of the trade depression would be alleviated if manufacturers would but see that the old-fashioned methods of organisation are a source of unremunerative expense. Some do, but instead of consulting the experienced organiser, they too often scrap their obsolete system, with the hope that by ridding themselves of one source of expense, they have a chance to recover. When they do come to realise that such a passive attitude does not encourage prosperity, they will, perchance, if they still have some life left in them, turn to those, such as the author of this book, who have studied carefully economical organisation. In the handling of material, both physically, and on paper in the form of records, the expert could, if he were called upon, help to mitigate the wholesale loss which is going on. But the manufacturer must have a reasoned and lucid case laid before him, and so presented to him that he will be compelled to act upon it. If this volume had received the master touch that would have made it not only readable, but also compelling, the author would have done a vast service to British industry. The plans are there, but the draughtsmanship will not commend them to the casual observer.

Department of Scientific and Industrial Research; Technical Papers on Illumination Research: No. 1, The Terminology of Illumination and Vision (9d. net); No. 2, The Transmission Factor of Commercial Window Glass, by A. K. Taylor and C. J. W. Grieveson (6d. net); No. 3, Light Distribution from Industrial Reflector Fitting No. 1, by H. Buckley and C. J. W. Grieveson (1s. net). London: H.M. Stationery Office.

In the course of a discussion before the Illuminating Engineering Society early in the present year, it was stated that details of the investigations undertaken by the Illumination Research Committee of the Department of Scientific and Industrial Research would shortly be embodied in a series of technical papers. The three papers above represent the first of the series. In each case a short prefatory note is included, explaining the objects of the investigation—a useful feature. The idea of first publishing definitions of terms used in subsequent papers is a natural one. It is well that those dealing with illumination should be put on record, as some of these terms are somewhat loosely used, even by those vocationally concerned with illumination. The addition of definitions of terms used in connection with vision is, however, a new step. It is rarely that these have accompanied treatment of illumination and their juxtaposition should be helpful to those interested in researches in which lighting experts and physiologists are equally concerned.

Technical Paper No. 2 is useful in showing that the amount of light absorbed by commercial window glass is much greater than is commonly appreciated. Values depend on the inclination of the light, and vary according to whether the rays are direct or diffused. Values range from 62 to 84 per cent. according to the conditions of test. Prismatic glass comes out well, as the absorption is not very much greater than that of plate glass, while the advantages as regards improved distribution of light are often considerable. It is interesting to observe that the method of having the smooth surface facing the light, with the ribbed surface inside, is frequently favourable to maximum transmission, besides enabling the external surface to be more readily kept clean.

Technical Paper No. 3, which amplifies the data already published in the B.E.S.A. specification for industrial lighting reflectors, is of special interest to electrical engineers. It is concerned mainly with the effect of the angle of cut-off on performance. Diagrams illustrating the influence of this angle on efficiency and distribution of light are presented. It is of interest to note that the luminous efficiency falls off at nearly the same rate for all the reflectors studied, namely, a decrease of from 1 to 1.5 per cent. for each increase of 1 deg. in the angle of cut off. The distribution ratio is more affected, the variation being as high as 50-60 per cent. in certain cases—an indication to the contractor and the consumer of how greatly illumination may be affected by inserting lamps in types of reflectors for which they were not intended. Under the conditions studied the extreme variations in the luminous efficiencies of reflectors are from about 50 to 80 per cent. Under normal conditions, with a reasonable angle of cut-off an efficiency approaching 70 per cent. may apparently be expected. There can be no question that the small sacrifice in efficiency involved in having a suitable angle of cut-off, and thus reducing glare, is well worth while. Yet another point brought out by these researches is the effect of variation in the shape of the filament. The ring filament in general leads to greater efficiency than the "festoon" shape, the difference in efficiency in certain cases being as high as 5 per cent.

The researches described in these papers have evidently been made with great care, and it is useful to have the results of impartial and authoritative tests on these somewhat complex problems. Further papers dealing with other researches of the Committee will be awaited with interest.

Alternating-Current Rectification. By L. B. W. Jolley, M.A., M.I.E.E. Second Edition. Pp. xxii+472; figs. 340. London: Chapman & Hall. 1926. Price 30s. net.

The second edition of this valuable work will be found to have been considerably enlarged, owing to the incorporation of a considerable amount of new matter, the necessity for this being indicative of the rapid advances which have recently been made in the development of rectifying apparatus. The preliminary mathematical chapter on the analysis of rectified wave forms has been amplified, and additional notes are given on analytical methods of resolving complicated wave forms. In the chapter on commutator rectifiers, the principles and construction of the transverter have been considered at some length, and a description of a small commutator rectifier is included. The chapter on thermionic rectifiers has been considerably expanded, and some interesting matter has been added, relating to the difficulties attending the design of large rectifiers of this class, in which the filament current exceeds 50 amperes. One of the principal of these difficulties is that of unequal filament temperature, owing to the superposition of the emission current on the heating current. The effect of this is usually to give a higher temperature at the negative end of the filament, and means have to be contrived whereby the polarity of the filament is periodically reversed. When the filament is supplied from a source of a.c. this reversal is conveniently effected by arranging for the frequency of the filament supply to be slightly different from that of the current to be rectified. For 50-cycle work a difference of five cycles has been found effective, this giving a reversal of the polarity of the filament with respect to the current rectified, five times a second. This rate of reversal is sufficient to maintain an approximately constant temperature throughout the whole length of the filament. A new chapter has been added on the installation of thermionic rectifiers, in which is an interesting note on a method of producing a rectified direct-current free from ripples, by the use of a special wave form on the a.c. side. Another new chapter deals with methods of obtaining small supplies for filament and anode circuits in small wireless sets, and a third additional chapter gives a brief account of recent work carried out in connection with the problem of converting direct to alternating current by means of apparatus using thermionic valves.

The amount of work carried out by Mr. Jolley in the revision and amplification of this book must have been very considerable. He will, undoubtedly, have maintained or even enhanced the reputation of his masterly work, which will remain the standard treatise on the subject of alternating current rectification.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Campaign Notes, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

The E.D.A.-E.L.M.A. Campaign.

The official report for the week ended February 26th states that demonstration houses were opened at Derby, St. Albans, Portsmouth, and Cardiff. The last has been organised by the Ward Electric Co., and the front is a replica of the prize house. A demonstration house was to be opened at Bradford on Tuesday last, and one was to be inaugurated at Taunton yesterday (Thursday). The Derby house has been well attended, and the electrical contractors are very satisfied with the business results. A successful exhibition was opened at Halesowen on February 15th, and it is being visited by large numbers. During the current month, which is the last of the campaign, houses are to be opened at Chesterfield, Leicester, the Potteries, Birmingham, Dudley and Tamworth. The demonstration house at Sheffield has been so successful that the local circle has decided to keep it open until to-morrow (Saturday). A large increase in the demand for the competition booklet is reported, and ballot forms are reaching headquarters at the rate of over a thousand a day. During the current week the large working model of the prize house is on view at the St. Albans branch of the North Metropolitan Electric Power Supply Co.; the exhibition of the model in the showrooms of the Manchester Electricity Department led to inquiries from a large number of visitors. The North-East Coast children's competition evoked great interest and a high standard was reached in the painting competition.

The all-electric house organised by the Exeter and District Circle closed on February 19th. During the fortnight's run over 15,000 people visited the house. Special arrangements were made with the Exeter Education Committee for the purpose of demonstrating the wonders of electricity to school children. On February 24th, at a meeting of the executive committee of the Circle, the chairman (Mr. Arthur Force) presented Mr. Farthing, the G.E.C. demonstrator, with a silver cigarette case, and Mrs. Petersen, another demonstrator, with a gold wristlet watch.

At Glasgow, on Monday last, Mrs. David Mason, wife of the Lord Provost, formally opened the third all-electric house demonstration. Twenty thousand people have visited the second house at Shawlands. The latest demonstration house is a large self-contained dwelling at Hyndland, which has been specially fitted with every kind of modern electrical domestic appliance.

Aberdeen's all-electric house was opened to the public on February 22nd, and has since been visited by large numbers. The exhibition, which is to continue until March 12th, is under the auspices of the local circle comprising the Corporation Electricity Department, and electrical manufacturers, wholesalers, and contractors. Before the opening ceremony, Mr. J. A. Bell, city electrical engineer, gave a short address on the progress of electricity in Aberdeen. Recently, he said, the contractors and the Town Council had come to an arrangement whereby houses could be wired on the hire-purchase system, a method which allowed them to wire a class of house to which they would never have obtained access without that aid. That scheme had not been running a year yet, but already a sum of £4,000 had been spent in wiring houses on this basis.

Councillor Duncan, convener of the Electricity Department, also addressed the assembly. Tea was afterwards served, and on behalf of the local committee, Mr. A. McRobb presented Mr. Duncan with an electric kettle.

Trade Facilities Guarantees.

A further list of guarantees made by the Government under the Trade Facilities Acts was published recently. These guarantees, which bring the total amount to £70,721,780, include the following:—Ross-shire Electric Supply Co., Ltd. (extension of supply), £20,000; and £1,200,000 for the purchase of electrical equipment in Great Britain for a Hungarian electrical scheme. In the House of Commons on February 15th, Mr. Churchill informed Sir F. Wise that the Government had had to implement its guarantees under the Act in only five cases, involving a total amount of £34,837.

New Italian Company.

Among the companies lately formed in Italy is the Società Telefonica Elettrica Ligure-Lombarda, Milan, with a capital of 100,000 lire.

The Honduras Radio Market.

Reports indicate that the Honduras market for radio supplies, although still restricted, is becoming more important. The receipt of a British-made set has attracted much attention, supplies hitherto having come almost exclusively from the United States. The principal market for sets and components is in Tegucigalpa, the capital, with an appreciable English-speaking population. Few natives as yet own sets, but it is thought that, with well-organised propaganda, considerable progress in this direction might be made—*Reuter's Trade Service* (Tegucigalpa).

Anglo-French Industrial Conference.

The Federation of British Industries has arranged a conference with a number of leading French industrialists to take place on March 7th and 8th. The delegates from France will include M. Hecker, managing director of the French Thomson-Houston Co., and M. Dalbouze, president of the Syndicate of Machinery Manufacturers, Boilermakers and Founders of France. The principal matters down for discussion are:—The economic and fiscal treatment of nationals and companies of one country admitted to settle in the territory of the other; Customs nomenclature and classification; the organisation of production, including in particular international agreements, considered from the point of view of production, of the customer, and of labour, their legal position, and their connection with the Customs problems; the importance of the collection and prompt exchange of statistical information with regard to industrial production; and the limitation of trade fairs and exhibitions.

Hungarian Electrical Exports.

The *Board of Trade Journal* reports that during 1926 Hungary exported electrical machines and apparatus valued at 15,613,000 gold crowns, as compared with 13,982,000 cr. in 1925.

America and the British Market.

In a recent issue of *Commerce Reports*, the Electricity (Supply) Act, 1926, was reviewed at some length, and after stating that this Act and the current E.D.A.-E.L.M.A. Campaign should result in a greatly increased demand for electrical apparatus of all kinds, our contemporary says:—"It would be well for American manufacturers to strengthen or renew their operations in the United Kingdom, as, with the passage of this Act, there should be greater opportunity for the sale of electrical machinery and apparatus to industrial establishments, as well as to the homes. American firms considering competing in this market would do well to carefully analyse the conditions in the United Kingdom to find out the best methods on which to base their business. Considering the potential market for electrical apparatus in general, the future looks unusually bright for the sale of American material to the United Kingdom. If the 7,000,000 homes located in the areas of the present electricity supply undertakings were to be wired, this would in itself mean an expenditure of at least $560,000,000, a large percentage of which should be spent in trade with the United States."

New Municipal Showrooms and Offices.

The Sheffield Electricity Supply Committee has recommended to the City Council that the old telephone exchange be purchased, at a cost of £16,500, for conversion into additional showrooms, offices and stores for the Electricity Department.

German Cable Industry.

The booking of orders for lighting and power cables at the present time is said to be of small extent in accordance with the season, the works being but little employed on this branch. An increase in the orders is expected at the end of April, when the laying of cables will be resumed. The foreign trade is stated not to have undergone any change.

Another Polyglot Pamphlet.

In a recent issue we made mention of a booklet in 16 languages produced by the Brownie Wireless Co. We have now received from Mr. A. Hinderlich, 1, Lechmere Road, N.W.2, a folder dealing with piezo-electric quartz crystals in nine European languages.

D

Defective Railway Material in South Africa.

The Johannesburg correspondent of the *Financial News* says that, following close on the disclosure that 13 American locomotives recently purchased were already ineffective, the *Sunday Times* announces that rails to the value of a quarter of a million pounds sterling purchased on the Continent and intended for railway replacements have been condemned. The rails were apparently passed by the oversea official, whereupon the purchase price was paid on their arrival at Cape Town. However, when the rails had been examined by engineers, they were found to be showing cracked treads, and the lot condemned as useless are now hidden in the Cape Town railway yards. The South African railways are slowly and expensively learning that British goods are best.

Local Exhibitions.

Carmarthen.—Mr. A. Preston, engineer and manager of the Carmarthen Electric Supply Co., Ltd., informs us that his company intends to hold a domestic electrical exhibition from March 28th to April 2nd, and he will be pleased to hear from manufacturers and factors who wish to take part. He states that this will be the first exhibition of its kind to be held at Carmarthen, and the furthest west in the country.

Newark.—In connection with the recently-inaugurated electricity undertaking (engineer: Mr. R. W. Willis), an exhibition is being held at the Town Hall from March 7th to 12th.

The "J. & P." Wiring System.

The accompanying illustration depicts an attractive display prepared for electricity suppliers and contractors by Messrs. Johnson & Phillips, Ltd. It comprises a three-ply board measuring 4 ft. 4 in. by 3 ft. 2 in., taking the form of a flat model of a house in bright colours. On the central board are

A "J. & P." Wiring System Display.

fixed examples of the essential features of the "J. & P." wiring system. The company has also issued an illustrated booklet relating the story of "John Green's" conversion to electricity *via* the "J. & P." system. This is arranged for overprinting—the example received bearing the name of the Barnsley Corporation Electricity Department.

Trade Announcements.

Messrs. J. H. Winter & Co., electrical engineers, of Bristol, have removed their business temporarily to Merchant Street, owing to the rebuilding of their premises in Narrow Wine Street.

The Cressall Manufacturing Co. has removed to 31 and 32, Tower Street, Birmingham.

Messrs. E. H. Hunter & Co. have removed to 68, Victoria Street, London, S.W.1.

Premier Cooler and Engineering Co., Ltd., has removed to 429, Strand, W.C.2. Telephone: Gerrard 6161.

Henrion Carbons, Ltd., has removed to Kinnaird House, 1, Pall Mall East, S.W.1. Telephone No.: Regent 3484. Telegraphic address: "Carboneros, London."

Messrs. Drake & Gorham, Ltd., have opened premises at Old Bank House, 105, High Street, Winchester.

New showroom premises have been opened by the Lichfield Agricultural Co., Ltd., Market Street, Lichfield, for the electrical department of the business.

Messrs. J. T. Bowles & Son, of 2a, York Street, Ramsgate, have taken over the management of the wireless business at the Southern Stores, 100, High Street.

Northern Steel & Hardware Co., Ltd., has removed to 1 and 3, Southgate, Manchester. Telephone: Central 4078 & 9. Telegrams: "Assiduous, Manchester."

Frigidaire, Ltd., has opened showrooms at 14, Waterloo Street, Glasgow, and 13, North St. Andrew Street, Edinburgh.

The Alton Battery Co., Ltd., has appointed the Robinson and Hands Electrical Co., Ltd., Barwick Street, Birmingham, as its Midland agents, and Messrs. Paterson & Service, 38, Bath Street, Glasgow, as its agents for Northern Scotland.

New Catalogues and Lists.

Messrs. J. Macgregor & Co., 3 and 5, Mansion House Chambers, Queen Victoria Street, London, E.C.4.—Folder giving prices of "Ferrowatt" lamps.

Messrs. Bronze Agencies, Ltd., 125, Mansion House Chambers, London, E.C.4.—List describing and illustrating in colour the "Lunina" electrically-illuminated fountains.

Mr. O. N. Beck, 11, Queen Victoria Street, London, E.C.4.—Circular describing the "Safegrip" patent drill protector.

Mr. J. S. Plumtree, 90-91, High Holborn, London, W.C.1.—Price list of cables, flexible cords and wires.

The Electrical Equipment and Carbon Co., Ltd., 109-111, New Oxford Street, London, W.C.1.—Three new priced leaflets describing respectively: V.I.R. and lead-covered cables, the "Mego-meter" insulation testing set, and "Elin" bell transformers, transformer bells and buzzers.

Foolprufe Patent Accumulator Co., Ltd., Kettering Road, Market Harborough.—List of "L"-type Lion lighting batteries, with ebonite "lattice" separators, giving dimensions, &c., unpriced. Agent for S.E. and Home Counties, Mr. St. J. Shepherd, Eastwoodbury, Southend.

Messrs. Watson & Sons (Electro-Medical), Ltd., Sunic House, 43, Parker Street, W.C.2.—"Artificial Sunlight," 1927 edition, explaining the therapeutic applications of ultra-violet rays and the apparatus employed, with particulars and prices.

Messrs. Donovan & Co., Cornwall Street, Birmingham.—List No. 1,127, a comprehensive catalogue of electrical accessories, including switches, plugs and sockets, lampholders, conduit fittings, lighting fittings, fuseboards, domestic appliances, &c. Fully priced.

Automatic & Electric Furnaces, Ltd., 173-175, Farringdon Road, E.C.1.—Catalogue Section H, dealing with "Wild-Barfield" small electric furnaces for laboratories and works.

Power Contracts, Ltd., 138 and 140, Southwark Street, S.E.1.—A net trade price list of a.c. and d.c. guaranteed motors and a pamphlet dealing with reductions in the prices of "Batwin" motors.

Messrs. Cecil Hodges & Co., Ltd.—Folders Nos. 127 and 128 illustrating and describing the "Empire" patent power pump.

Unique Patents, 388, City Road, E.C.1.—A pamphlet describing the "Unique" shade carrier and lampholder. Illustrated and priced.

Messrs. Pickerings, Ltd., Globe Elevator Works, Stockton-on-Tees.—A well-illustrated brochure describing the company's electric passenger and goods lifts.

The Lea Recorder Co., Ltd., 28, Deansgate, Manchester.—Booklet M.L. illustrating and describing a number of applications of Lea recorders in power stations, &c.

The British Thomson-Houston Co., Ltd., Crown House, Aldwych, W.C.2.—An attractive cardboard cut-out advertising "B.T.-H." radio valves.

Mullard Wireless Service Co., Ltd., Denmark Street, London, W.C.2.—A "quick guide" for P.M. valves in different circuits, their operating characteristics, and a replacement chart (cardboard, 12 in. by 8 in.) which should be very useful for the trader.

Bankruptcy Proceedings.

J. G. Sandell, 20, Hart Road, and Ansell Road, Dorking, electrical contractor.—The first meeting of creditors was held recently at 29, Russell Square, W.C.1. The statement of affairs showed liabilities of £590, against assets of £79, leaving a deficiency of £511. Debtor attributed his failure to being unable to recover debts due to him and law costs incurred in that connection. In April, 1922, with £60 capital, he commenced business on his own account as an electrical engineer and contractor. The business was successful, and early in 1924 he removed to larger premises. In September, 1925, he obtained a contract for an electrical and central heating installation at a kinema in Dorking for £652. The contract was completed, but he was unable to obtain payment of a balance of £369 owing in connection with it, and debtor said that that loss was the cause of his difficulties. The case being a summary one was left with the Official Receiver as trustee of the estate. The following are creditors:—

	£		£
British Thomson-Houston Co., Ltd.	30	National Radiator Co., Ltd.	70
Curtis, P., Ltd.	25	Sufra Electrical	25
D.P. Battery Co., Ltd.	25	Thomas, F., & Co. ...	40
Dorking Electric Supply, Ltd.	25	Walworth-Munzing, Ltd.	40
General Electric Co., Ltd.	25	Wholesale Fittings Co., Ltd.	35
General Cable Co., Ltd.	60	Walsall Hardware Co., Ltd.	25

Comton Wireless Manufacturing Co. (Alexander Pacy Pacifico, Jack Pacy Pacifico, and Raphael Feitelson, trading as), lately carrying on business at 25-26, Bartholomew Square, Old Street, London, E.C.—The failure of this firm occurred in June, 1926, and on February 22nd an application for an order of discharge was made on behalf of the bankrupt Alexander Pacy Pacifico. The Official Receiver reported that the provable debts of the firm amounted to £2,252, whilst the assets, valued at £1,830, had realised

only £332, owing chiefly to the fact that the stock-in-trade, purchased for £1,250, had yielded only £275. A dividend of 1s. 6d. in the £ had been paid. The bankrupt gave up his business of a fancy goods importer to join the above partnership in March, 1924; they traded successfully until February, 1926, when the business was adversely affected as a result of the general slump, and it was subsequently carried on at a loss. In March, 1926, with the object of obtaining additional capital with which to tide over the slump period and to develop the export side of the business, which was commenced in September, 1925, they endeavoured to obtain £3,000 in the form of investments in the business, but owing to the general strike intended investors withdrew before the negotiations could be completed. In June, 1926, judgment creditors levied execution on the stock and effects, and the business came to an end. The application was opposed by the Official Receiver upon statutory grounds, including unjustifiable extravagance in living and giving undue preference to a creditor. His Honour upheld the report of the Official Receiver, and granted a discharge subject to a judgment for £5 to be satisfied by an immediate cash payment.

E. W. Kirk, lately trading as the Ace Radio Manufacturing Co., 26, Curzon Street, Derby, wireless apparatus maker.—The first meeting of creditors was held on February 24th at the Official Receiver's offices, Nottingham. The statement of affairs showed gross liabilities of £290, of which £285 was expected to rank, and there was a deficiency of £269. Debtor attributed his failure to bad trade accentuated by the coal dispute, to the fact that bigger makers were undercutting, costs on writs, &c. It appeared that he patented a special coil and in October, 1924, with £50 capital in cash and materials, he commenced business on his own account to work the patent. The business was successful at first, but subsequently, owing to a reduction in prices, he was unable to compete. In June, 1926, he sold the patent for £75. Creditors pressed, and several judgments were obtained, and he filed his petition. The matter was left with the Official Receiver as trustee.

C. J. Nichols (C. J. Nichols & Co.), electrical engineer, 7, Park Street, Bridgend.—Last day for proofs for dividend, March 11th. Trustee, Mr. G. G. Poppleton, 26, Corporation Street, Birmingham.

S. T. Hosken, wireless accessories manufacturer and factor, 153, Fleet Street, E.C.—Bankrupt's discharge suspended until January 28th, 1928.

J. E. W. Archer, wireless dealer, &c., late of 259, Crookes, Sheffield.—Last day for proofs for dividend, March 14th. Trustee, Mr. L. J. Clegg, Official Receiver's offices, 14, Figtree Lane, Sheffield.

A. H. Richardson (Radio Supplies), wireless manufacturer, 4, Rose Hill, and Wellingborough Road, Finedon, Northampton.—Receiving order made February 18th on debtor's own petition.

J. Humphreys, plumber and electrical engineer, 1, Yard Behind the Plough Inn, Oldham Road, Rochdale.—Trustee, Mr. J. G. Gibson, Official Receiver, Byrom Street, Manchester, released February 17th.

J. R. Charnock, cycle dealer and electrical engineer, Meanwood Road, Meanwood, Leeds.—First and final dividend of 17s. 3d. in the £ payable March 17th at the Official Receiver's office, 24, Lower Bond Street, Leeds.

G. W. Tempest (Northern Radio Co. and the General Wireless Trading Co.), radio and telephone engineer, 12, Sandhurst Road, Stockport, 40, Brazennose Street, and Arcade Chambers, Manchester, and Commercial Street, Leeds.—First and final dividend of 11d. in the £ payable at 27, Brazennose Street, Manchester.

Company Liquidations.

J. P. Castle & Co., Ltd., 72, Shoe Lane, London, E.C., electrical engineers, &c.—A meeting of creditors was held on February 23rd at 50, Gresham Street, E.C., when a statement of affairs was presented, which showed liabilities of £573. The net assets were £87, and the deficiency was £482. It was reported that the company was registered at the beginning of last year with a nominal capital of £2,000, of which £1,512 had been issued and was fully paid. The vendor was allotted shares of the face value of £1,000, fully paid, whilst shares for £512 were issued for cash. No trading figures had been prepared, but the turnover had probably been about £100 a month. The meeting appointed the principal creditors to act as a committee in conjunction with the liquidator. The following are creditors:—

	£		£
Baxter & Caunter, Ltd.	179	Crane, Bennett & Co. ...	26
Blair, J. F.	20	Girling, L.	70
Chloride Electrical Storage Co., Ltd.	54	Wright, William, & Co.	53

Claremont, Johnson & Co., Ltd., electrical and wireless factors, 4, Union Place, Wells Street, Oxford Street, W.1.—A meeting of the creditors of this company was held on February 28th, at Winchester Street, E.C. The chair was occupied by Mr. W. J. Hodge, one of the joint liquidators. The statement of affairs presented disclosed liabilities of £4,808, and assets, after allowing £214 for preferential claims and £2,545 for loans on debentures, of £4,627, leaving a deficiency of £181. The assets included stock-in-trade £2,650, and good book debts £3,275. Mr. Hodge stated that the company was formed in July, 1922, with a nominal capital of £4,000, to acquire a business formerly carried on under the style of Claremont, Johnson & Co., and to carry on the business of importers and manufacturers of electrical apparatus, the consideration being £906, satisfied by the issue of fully paid £1 shares. The capital had been increased from time to time and the paid-up capital to date was £2,606. There were 1,500 shares, on which 10s. each remained unpaid, but £200 had been paid in advance in respect of them, leaving the unpaid calls to date £550. For the year to March, 1923, the turnover had been £14,903, and there was a net profit of £491. In the following year the turnover was £25,125, and there was a profit of £414. For the year to March, 1925, the turnover was £43,872, and there was a profit of £1,074. In the following year the turnover was £30,976, and there was a loss of £1,373. The liquidator stated that the debenture holder was Mr. David Cohen, whilst he (the chairman) had been appointed receiver on his behalf. He was also a director of the company. When the company took over it agreed to pay the liabilities then existing. The liabilities in the balance sheet of March, 1926, were £7,357. The assets were approximately £9,000. The debentures were created on October 22nd, 1926. An interim statement got out at that time showed a loss of about £500 or £600. A Leeds branch of the business was started just prior to the coal dispute, and that was being continued by the receiver, as was the London business, with a view to a sale as a going concern. The liquidator had had no definite offer at the present time. Mr. Hodge intimated his willingness to resign in favour of Mr. E. H. Hawkins, of Messrs. Poppleton, Appleby & Hawkins, 4, Charterhouse Square, E.C., who was appointed joint liquidator, with a committee of five of the principal creditors.

With reference to the above matter, The Castellina Co. (1926), Ltd., of 52, Great Marlborough Street, London, W., has written to us under date February 28th, as follows:—"It appears that many people in the trade are under the apprehension that The Castellina Co. (1926), Ltd., is connected with the firm of Claremont, Johnson & Co., Ltd., now in liquidation. May I point out that the two companies were actually competitors. Although Mr. Claremont and myself were originally directors of Claremont, Johnson & Co., Ltd., neither of us has taken any management in the latter since we left its employ some considerable time ago.—G. W. Johnson, Managing Director."

Orlings Telegraph Instruments Syndicate, Ltd.—Winding up voluntarily. Liquidator, Mr. H. Hagon, 15, Grosvenor Mansions, 82, Victoria Street, S.W. A meeting of creditors was held at the liquidator's offices on March 3rd.

St. Helens Electric Lighting Co., Ltd.—A meeting of members is called for March 25th at Broad Sanctuary Chambers, Tothill Street, S.W., to hear an account of the winding up from the liquidator, Mr. C. H. Jones.

Presland Electric Supplies, Ltd.—A meeting of members is called for March 28th at 84, Eden Street, Kingston-on-Thames, to hear an account of the winding up from the liquidator, Mr. W. Bronson.

Neutron, Ltd.—The first meetings of creditors and contributories were held on March 3rd at Carey Street, W.C.

Dissolution of Partnership.

Glaisher & Dives, dealers in photographic and wireless supplies, 14, George Street, Croydon.—Mr. W. R. Glaisher and Mr. F. V. Dives have dissolved partnership. Mr. Glaisher will attend to debts and continue the business.

Our Electrical Machinery Markets.

With the January trade returns, the Board of Trade resumed the practice of giving details of the destination of electrical machinery exported from this country. The following table shows the distribution of this machinery, and the figures for January, 1926, are also given, with a note of increases or decreases:—

Destination.	Jan., 1926. £	Jan., 1927. £	Inc. or dec. £
European countries	48,757	71,691	+ 22,934
Japan	18,042	36,293	+ 18,251
South America ...	55,501	31,147	− 24,354
South Africa ...	47,892	148,393	+100,501
British India ...	102,131	126,451	+ 24,320
Australia	85,738	66,667	− 19,071
New Zealand ...	32,703	52,603	+ 19,900
Canada	8,730	17,510	+ 8,780
Other countries ...	74,076	62,568	− 11,508
Totals ...	£473,570	£613,323	+£139,753

The Census of Production.

A preliminary report upon the results of the third Census of Production appeared in last week's *Board of Trade Journal*. These deal with the iron and steel trades, and interesting details are given of production in 1907 and 1924, employment, the use of power, &c. The report is the first of a series which, are, presumably, to be published as supplements to the *Journal*.

Prices of Raw Materials.

Reporting on February 26th, Messrs. James Forster & Co. state: "Closing prices of lead yesterday were £28 2s. 6d. for February, and £28 10s. for May, a rise on the week of 10s. per ton. . . . The prospect is for continued firm markets, accompanied by a larger consumption of lead, and a probable small decrease in supplies."

Messrs. F. Smith & Co. report, March 1st: Copper (electrolytic) bars, £63 5s., 55s. inc.; ditto ditto sheets, no change; ditto ditto wire rods, £73 5s., 30s. dec.; ditto ditto h.c. wire, 9¼d., ¼d. inc.; silicium bronze wire, 10¾d., ⅛d. dec.

Messrs. James & Shakespeare report, March 1st: No change in the prices for copper bars (best selected), sheet and rod; English pig lead, £30, 10s. inc.

Messrs. Edward Till & Co. report, March 1st: India-rubber, Para fine, 1s. 4½d., ¾d. inc.

Big Cable Company Deal.

Mr. W. Emlen Roosevelt, chairman of the board of directors of All-America Cables, Inc., and Mr. S. Behn, president of the International Telephone and Telegraph Corporation, made the following announcement after the meetings of their respective boards held on February 23rd:—The International Telephone and Telegraph Corporation has authorised an offer to issue its stock in exchange for All-America stock at the rate of four shares of International stock for three shares of All-America stock, and the board of All-America Cables, Inc., has recommended the acceptance of the offer. The offer contemplates that the All-America stock shall be deposited with a committee nominated by the board of All-America Cables, under a deposit agreement authorising the transfer of the deposited stock to the International Co., when, in order, depositors are to receive certificates of deposit. Messrs. J. P. Morgan & Co. are to be the depositaries of the committee, and the certificates will be registered by the Central Union Trust Co. Further details of the offer will be communicated in a circular presently to be issued by each of the corporations to its stockholders. The consummation of the transaction will require a deposit under the agreement of an amount of stock deemed sufficient by the International for its purposes. It is stated that the successful operations heretofore of each of these corporations in the field of electrical communications will be materially furthered by the affiliation above proposed. The present members of the board of All-America Cables have been requested to continue as such, and certain of these directors will be elected to the board of the International Co. Mr. Merrill, as president, and the other officers and staff of All-America Cables, are to continue in its management. Representatives of the International Co. will be elected to the board of All-America Cables in due course.

Deed of Assignment.

J. B. Braby, electrical engineer, 87, Maybury Road, Woking.—Particulars of claims by March 22nd to Mr. W. A. J. Osborne, trustee, Balfour House, Finsbury Pavement, E.C.

Australian Tariff Decisions.

The duties on certain electrical appliances have recently been decided by the Australian Tariff Commissioners as follows:—Static oil-immersed condensers: free under the British preferential tariff; 5 per cent. under the intermediate tariff; and 10 per cent. under the general tariff. Similar rates apply to electrically-driven human hair-clipping machines, automatic voltage regulators, and auto-synchronous electric motors. Electrically-heated cotton, wool, &c., testing ovens and auto-valve lightning arresters are admitted free of duty under all three tariffs.

Book Notices.

Scientific Papers of the U.S.A. Bureau of Standards, No. 542, "Electric Field of a Charged Wire and a Slotted Cylindrical Conductor" (10 cents).

"The Age of the Earth," by A. Holmes. Pp. 79. Price 6d.; "Modern Scientific Ideas," by Sir Oliver Lodge, F.R.S. Pp. 79. Price 6d. London: Ernest Benn, Ltd.

"Science Abstracts" (A and B). Vol. XXX. Part 2. February 25th, 1927. London: E. & F. N. Spon, Ltd. Price 3s. each.

"Electric Locomotives," by R. H. Wright. Pp. 32; illustrated. London: Association of Engineering and Shipbuilding Draughtsmen. Price 2s.

"Sell's Registered Telegraphic Addresses for 1927." London: Business Dictionaries, Ltd. Price 45s.—This Directory for 1927 is published in a new form so that it can be more easily handled, a broader page has been used and several new features have been incorporated. Chief among the improvements is a system of reference by which the telegraphic address of any firm can at once be found or, *vice versa*, the firm owning any known telegraphic address. Each name has been given a code number, so that in the text of a telegram or cable it may be referred to by number, while the indexing system enables the user instantly to find the number of any firm, or the firm represented by any known number. The classified trade list of 130,000 names and addresses has been rearranged and made more complete, and forms a comprehensive guide to the chief firms in every branch of business throughout Great Britain and Ireland.

"Waterworks Pumping Plant" is the title of a brochure issued by Messrs. Mather & Platt, Ltd., Manchester, dealing with some interesting schemes in various parts of the world where centrifugal pumps are employed. Naturally, electric driving is often adopted for this purpose, but steam turbines and oil engines are sometimes used, and examples of all these are found in this well-illustrated publication, working under a variety of conditions.

"Atomic Theory," by A. Haas. Pp. xiv+222; figs. 56. London: Constable & Co., Ltd. Price 10s. 6d. net.

For Sale.

Burton-upon-Trent Electricity Department has for disposal one 2,000-kW Westinghouse high-pressure turbo-alternator, with surface condenser and auxiliaries. The South London Merchandise Mart will sell by auction on March 10th, at 10, Red Lion Passage, Red Lion Square, W.C., the stock of an electrical and wireless factor. (See our advertisement pages to-day.)

Recent Contracts.

Messrs. Stuart Turner, Ltd., Henley-on-Thames, have just delivered to the Post Office two generating sets for battery charging, the output being 2.28 kW. The engines are of the company's standard two-cylinder, 4-stroke type, direct coupled to "Bull" generators. The sets are fitted for running on gas, but stand-by petrol carburettors are also supplied. A 500-W set has also just passed tests by the Post Office engineers. This plant is identical with the standard "Stuart" country-house plant. These sets are additional to the contract for eighty 120-W sets now going through the works.

Messrs. J. Blakeborough & Sons, Ltd., have received an order for equipment for controlling the water supply to four turbines, aggregating 126,000 h.p., which are being installed on the Sho River, Japan, by the Nippon Electric Power Co. The equipment comprises four "Larner-Johnson" valves, weighing over 50 tons each, to work under a head of 176 ft. They will be 11 ft. in diameter.

Among the orders which Messrs. Yarrow & Co., Ltd., have in hand for their boilers are the following:—Three further h.p. boilers for the Barking station of the County of London Electric Supply Co., Ltd.; three boilers for the Portsmouth Dockyard power station; and four for the City of London Electric Lighting Co., Ltd.

Social Events.

The Social and Athletic Club of Standard Telephones and Cables, Ltd., New Southgate, has recently held several successful functions. The first of these was a whist drive at the works canteen, about 140 being present. After whist, dancing took place to the accompaniment of the works band. The works "Black and White" concert party gave a show before 400 people at a later date; the items, serious and humorous, were greatly appreciated. On Friday last a dance was held at the Alexandra Palace, about 500 attending. A number of future events have been arranged.

Bermondsey Strike Settled.

The strike of workers in the Bermondsey electricity undertaking was settled on February 24th, the man who was the cause of the dispute being transferred to another department.

Unemployment.

Unemployment is still decreasing; during the week ended February 14th the number of unemployed fell by 33,290. The total at that date was 1,270,200, as compared with 1,303,490 on February 7th and with 1,139,228 on February 15th, 1926.

British Representative in Brazil.

It is announced by the Department of Overseas Trade that the address of the Commercial Secretary in Brazil (Mr. E. Hambloch) is now: Rica Municipal 4, Rio de Janeiro.

Lighting and Power Notes.

Asia Minor.—New Power Station.—The Société des Tramways Smyrne-Gueuztepe has commenced the construction of a new power plant at Daragatch. The plant will have an initial capacity of 5,000 h.p. and an ultimate capacity of 30,000 h.p. Electricity will be transmitted by underground cables from Daragatch to Bahri Baba, where it will be stepped down from 6,000 to 600 V.

Australia.—Victoria.—Plans for a new generating station at Richmond are now being prepared by the Victorian Electricity Commission, following authorisation from the Attorney-General at the end of last year. Examination of the Melbourne Electric Supply Co.'s equipment, it is stated, shows that the boiler plant is highly efficient, and in excellent order, and will be available for use in the new power station. The old generating machinery of the company, however, is only adapted for single-phase working, and is unsuitable. Tenders for the supply of the new generating machinery will be called for as soon as the new specifications are completed.

Devonport (Tasmania).—The hydro-electric supply for the North-West was recently formally inaugurated by the State Governor at Devonport. The general manager of the department reports that the State now generates approximately 60,000 h.p. The extension to the North-West has cost £154,000, and there are prospects of the paper pulp industry coming to Burnie at an early date, justifying a further extension. The system will be paying its way this year, and the revenue expected is £262,000. The department does not expect any profit from the north-western extension at present, but it is anticipated that the farmers will use it as they are doing in the midlands and south.

Aylesbury.—Loans.—The Town Council has received sanction to a loan of £3,000 for domestic electrical apparatus to be let out on hire, and is to apply for sanction to a further loan of £15,406 for additional work required in connection with the rural electricity scheme.

Birmingham.—Price Reductions.—The charges for l.p. supplies of electricity are to be reduced by ½d. per kWh after the reading of meters for the March quarter.

Brightlingsea.—Electricity Supply.—The Urban District Council has requested the Colchester Corporation Electricity Committee to meet it to discuss the question of an electricity supply for the town. The County of London Electric Supply Co., Ltd., which is seeking powers to supply electricity in bulk to authorised undertakers in the county, has suggested that the Council should apply for its own Order as distributor. Mr. W. T. Warren has informed the Council of his intention to apply for an Order to supply electricity to the town, and states that he is willing to give the Council the right to purchase his undertaking within the next two or three years, or at the end of 21 or 30 years.

Brighton.—Loans.—The Electricity Committee has recommended that application be made for sanction to the following loans: £50,000 for mains and services; £2,000 for additional cooking and heating apparatus; £13,428 to cover excess expenditure on work at present being carried out.

Chesterfield.—Loans Sanctioned.—The Corporation has received sanction to the following loans: Mains and services, £55,311; hire-purchase wiring installations, £12,353; meters, &c., £11,174.

Continental.—Italy.—A scheme is in hand for the construction of important hydro-electric works in the Val Borbera, which will supply energy for the electrified part of the State railway system. There will be two power stations known as the Persi and the Pian-della-Botte. At the Persi station three sets, of 9,000 kW each, will be installed. The plant at the Pian-della-Botte station will include three sets, each of 4,500 kW.—*Reuter's Trade Service* (Milan).

Germany.—The United Westphalian Electricity Works Company, of Dortmund, has been occupied for a year past in gradually adapting its four generating stations to the use of pulverised coal, and for this purpose the company a little time ago acquired the Alte Haase and Gottessegen collieries. In order to extend the coal basis, the company has now obtained the majority of the shares in the Kleine Windmuhle colliery.

France.—An arrangement has recently been concluded between the Société de l'Electricité de Caen, whose distribution system extends into part of the Department of Calvados, and the Société de Distribution d'Electricité de l'Ouest and the Société des Gaz et Eaux which supply electricity to the Departments of Orne and La Manche, under which the generation of the electricity required for the three Departments will be centralised at the new station which has recently been erected on the banks of the canal at Caen. The three concerns have been amalgamated under the title La Société de l'Union Electrique de l'Ouest, and orders have been placed for the installation of an additional 12,000-kW turbo-generator at the power station.

Switzerland.—As part of the scheme for the completion of the Barberine-Vernayaz hydro-electric power station, the Swiss Federal railway authorities have been engaged for some time past on the erection of a power transmission line between Vernayaz and Rapperswil, with connections to the substations at Puidoux and Kerzers for the supply of electricity for the electrified railways in West Switzerland. The line has for some time past been in operation as far as Puidoux, but energy is now being transmitted over the full length of the line, which is estimated to have cost about £760,000.

Dorking.—Electricity Supply.—The Urban District Council has granted a further lease of the electricity Order to Messrs. Edmundson's Electricity Corporation, Ltd. The charge for lighting is to remain at 10d. per kWh, but the charge for heating and power is to be reduced from 6d. to 3d. per kWh.

Dover.—Electricity from Barking.—It is reported that the Electricity Commissioners have intimated to the Town Council that an electricity supply for the town is to be obtained in bulk from the Barking power station, with another station at Richborough. The change will probably be made in the next three or four years.

Dundee.—Electricity Extensions.—The Corporation electrical engineer (Mr. D. H. Bishop) has reported that during last December the capacity of the rotary convertor plant supplying the central area was heavily taxed, and extensions were now necessary to meet the increasing demand for electricity. The erection of sub-stations at a cost of £25,470 is proposed. Sanction has been received to the borrowing of £250,000 for extensions.

Guildford.—New Power Station.—The foundation stone of the new Corporation power station was laid by the chairman of the Electricity Committee on February 28th. The estimated cost of the station is £140,000, and it is hoped that it will be completed in October next.

Hornsey.—Extensions.—The Electricity Committee is to lay additional feeder cables at a cost of £6,500, and to extend the plant at Highgate sub-station at a cost of £1,500.

Horsham.—Year's Working.—The accounts of the Urban District Council's electricity undertaking (engineer: Mr. F. Ffrench) for the year ended March 31st last show a total revenue of £13,981, as compared with £12,716 in the preceding year. Working expenses increased from £6,678 to £7,661, leaving a gross profit of £6,321, as against £6,038. After deducting interest, capital expenditure charged to revenue, &c., there was a net surplus of £2,383, which was transferred to the district fund. The previous year's working resulted in a surplus of £1,622. The sales of electrical energy increased from 655,345 to 746 013 kWh, and the average price per kWh obtained fell from 4.35d. to 4.10d.

Huddersfield.—Opposition to Bill.—The Town Council is to oppose the Bill which is being promoted by the Yorkshire Electric Power Co.

New Plant.—The Electricity Committee has received sanction to the extension of the generating station by the installation of one 5,000-kW, 3-phase, 50-cycle turbo-alternator.

Lancaster.—Electricity Charges.—The Electricity Committee has announced that it does not propose to make any increase in the charges for electricity to meet the higher cost of coal.

Liverpool.—Contributions to Rates.—The sum of £100,000 is to be allocated by the Tramways and Electric Power and Lighting Committee towards the relief of next year's rates. The quota from the Tramways Department is £75,000, and from the Electricity Department £25,000.

London.—Islington.—The Lighting Committee has recommended the withdrawal of the increase of 10 per cent., imposed during the coal dispute.

Hackney.—The Finance Committee has recommended that application be made for sanction to a loan of £15,000 for cooking and other domestic appliances to be let out on hire.

Poplar.—The Electricity Committee has reported that the new generating station is nearing completion and will shortly be put into commission. As this is the first complete station of its kind to be erected in England, an opening ceremony is proposed, and Sir Andrew Duncan is to be invited to perform the ceremony. The Committee has received sanction to loans totalling £50,000 for electricity purposes.

Macclesfield.—Appointment of Consultants.—The Electricity Committee has recommended to the Housing Committee that Messrs. Merz & McLellan be instructed to prepare a comprehensive report upon the present electricity supply to the town and their recommendations as to a scheme for the future development of such supply. It is understood that the report will take six weeks to prepare. The Housing Committee has approved the recommendation.

Manchester.—Proposed Change-over.—The Corporation has given notice of its intention to apply for consent to alter the system and pressure of electricity supply from 3-wire d.c., 200 and 400 V, to a.c., single-phase, 230 V and 3-phase, 400 V.

Newbury.—Opposition to Bill.—The Town Council has decided to oppose the Bill of the Wessex Company on the grounds that it has power to purchase the undertaking of the Urban Electric Supply Co., Ltd., in 1943, and that in the Bill there is provision that the company will by agreement purchase the undertakings in its area.

Portland.—Special Order.—The Urban District Council has instructed its consulting engineers to take the necessary steps in conjunction with the Parliamentary agents to obtain a Special Order authorising it to supply electricity in the area.

Portsmouth.—Electricity Charges.—The Electricity Committee has recommended that the charges for electricity be reduced to those in force prior to the coal dispute.

Extension of Supply.—The Farnham Rural Council has requested the Corporation to extend the mains to six parishes in its area.

Rhyl.—Wiring of Small Houses.—According to the *Manchester Guardian*, with the rapid development of the district and the bulk supply of electricity to the Council's works from Dolgarrog, the Council has introduced a scheme for the "free" wiring of the smaller residences. Subject to the consent of the Electricity Commissioners, the Council will wire houses free of cost, and charge an extra 2d. per kWh for electricity consumed through prepayment meters until the amount received has covered the cost of the installation.

South Africa.—Electricity Supply Commission.—Arrangements have now been concluded between the Railways and Harbours Board and the Electricity Supply Commission whereby the latter body takes over as from January 15th last the generating station at Colenso, together with the transmission lines and automatic sub-stations at present supplying the railway between Glencoe and Pietermaritzburg, as well as a few of the principal towns along the route. Mr. T. P. E. Butt is the engineer to the Commission in charge of Northern Natal Section.

Durban.—The last addition to the municipal power station, comprising a Metropolitan-Vickers 5,000-kW set, and a Babcock & Wilcox 60,000-lb. boiler, has recently been put into service, and will meet the anticipated demand until the new Congella power station of the Electricity Commission is put into operation in 1928. The domestic load is increasing rapidly, and the recent six months' publicity campaign to popularise electric cooking and heating apparatus resulted in the installation during the six months of 632 cookers and 402 heaters.

Swansea.—Proposed New Station.—It is stated that the Town Council, after discussing a report of the deputation which recently waited on the Electricity Commissioners for guidance as to the attitude the Commissioners may adopt with regard to the erection of a super-power station to replace the present electricity works, has decided, in view of the fact that a larger generating station will in any event have to be provided to meet the future demands, to exercise an option already obtained on a site at Morriston on which to erect the first section of a station. The cost of this section is estimated at £500,000.

Swinton and Pendlebury.—Change-over.—The Urban District Council has decided to change over the electricity supply from the Bridge Street sub-station from d.c. to a.c. The approximate expenditure will be £69,000.

United States.—Electrical Development.—According to *Power*, work on the installation of the first 100,000-kW set of the new Long Beach steam plant No. 3 of the Southern California Edison Co. is to begin at once. Present plans call for the eventual installation of eight such sets, which will bring the total capacity of the entire Long Beach steam plant to more than 937,500 kW. This first set is to be ready for operation February 1st, 1928, and is to cost, together with necessary transmission and distribution equipment, approximately $7,000,000.

The American Gas & Electric Co. announces the purchase for the Philo plant of the Ohio Power Co. of a steam generating set rated at 165,000 kW. The installation of this set, complete with boilers, coal-handling apparatus and h.p. transformers, calls for an expenditure of approximately $17,000,000, and will raise the capacity of the Philo plant to 245,000 kW. This station, with the Windsor, Twin Branch, Cabin Creek, Kenova, Glen Lyn and Logan plants, feeds one h.p. transmission system which extends from Michigan through Indiana, Ohio and West Virginia to southern Virginia and Tennessee on the south and the Ohio River on the east, and is interconnected with the Chicago, Toledo, Cleveland and Pittsburgh lines, making it one of the largest interconnected power systems in the world.

West Ham.—Proposed Electricity Extensions.—The borough electrical engineer (Mr. F. W. Purse) has submitted a report to the Electricity Committee on the future development of the electricity undertaking. He states that there is sufficient accommodation in the engine house for the installation of two turbo-alternators with a rated capacity of 16,000 kW and a maximum continuous overload of 20,000 kW, and in the boiler house four 100,000-lb. water-tube boilers could be installed. When this plant is fully loaded, and if a further supply from the power station is desirable, three of the sets at present installed could be replaced by plant of double the capacity, *viz.*, 50,000 kW instead of 25,000 kW, making a grand total of 110,000 kW installed capacity. The cost of the extension is estimated as follows:—Generating plant, £143,000; boilers and accessories, £120,000; cooling towers, £12,000; switchgear, £10,000; foundations, &c., £25,000; pipework, £10,000; total, £320,000. The scheme would be carried out in two stages, and the first set would be installed in time to meet the winter load in 1929, which it is expected will be 34,500 kW. The second section of the work would be put in hand three or four years later, depending upon the rate of increase in the load. The estimated cost of the first section is £160,000. The report has been adopted by the committee, and application is being made to the Electricity Commissioners for sanction to carry out the extensions. The London and Home Counties Joint Electricity Authority is being given notice of the application.

West Midlands.—Electricity Supply.—The expenditure of £3,600,000 recently sanctioned by the West Midlands Joint Electricity Authority, is for the following purposes: Purchase of generating stations, £1,500,000; mains £400,000; sub-station switchgear, &c., £300,000; Ironbridge generating station, £1,250,000; Ocker Hill extension, £150,000.

Wirral.—Institution Supply.—At a recent meeting of the Board of Guardians, it was decided to ask the president of the Liverpool Engineers' Society for advice as to whether it would be more beneficial for the Guardians to take a supply from the Birkenhead Corporation for their institutions or to generate electricity themselves.

Tramway and Railway Notes.

Continental.—Hungary.—The Budapest correspondent of *The Times* reports that a contract has been signed by the Hungarian Government and representatives of a group of English capitalists known as the Talbot group. This group proposes to erect a large electric power plant in Hungary, at Banhida, for the electrification of the railway, Budapest-Hegyeshalom, the Hungarian section of the Budapest-Vienna line. The same plant would supply the Hungarian capital and the towns in the territory between Budapest and Banhida with electricity. The capital is estimated at about 60,000,000 pengoes (£2,200,000), and is to be provided by the English group under the guarantee of the Trade Facilities Act. It is said that 40 per cent. of this capital must be spent in the English market for machinery and other material necessary for the erection of the plant.

Spain.—Work is shortly to be commenced on the electrification of the railway between Barcelona and San Juan de les Abadesas.

France.—A scheme to replace the tramway between Cannes and Grasse by a railless-car service is under consideration. The tramway track and rolling stock are worn out, and it is considered that it will be cheaper to adopt railless cars than to endeavour to renew the existing plant.

Germany.—Work is well in hand on the electrification of the last section of the railway between Laubau and Breslau, Silesia, a distance of about 130 miles. To meet the increased demand for electricity, the central station at Mittelsteine is being extended to a capacity of 24,000 kW. A sub-station is also to be established at Mettkau.

Switzerland.—Plans have been prepared by the Berne Alpenbahn Co. for the electrification of the railway between Berne and Neuenberg. The cost of the work is estimated at approximately £272,000, half of which, it is suggested, should be furnished by the Swiss Government and the remaining half provided by the authorities of the Cantons of Berne, Neuenberg, and Freiberg.

Czecho-Slovakia.—A scheme is reported to be under consideration for the construction of an underground electric railway in Prague.

Halifax.—Fares Revision.—The Tramways Committee has recommended considerable changes in the tramway fares, with special privileges for long-distance passengers. It is proposed that the 1½d. fare in the town should be increased to 2d., but that a maximum of 3d. be charged for distances beyond the 2d. stage. This means that the fare for the longest stage (from Hebden Bridge, a distance of 7½ miles) will be 3d. instead of 9d.

Telegraph and Telephone Notes.

Australia.—"Beam" Radio-telegraph Tests.—We are informed by Marconi's Wireless Telegraph Co., Ltd., that in a statement telegraphed to London Amalgamated Wireless (Australasia), Ltd., announces that during the past three weeks the "beam" wireless station has been thoroughly readjusted and retested with very satisfactory results. During two days (February 23rd and 24th) beam signals from England were heard in Australia throughout the 24 hours, and two-way communication at speeds ranging from 250 to 3,000 letters per minute has been established daily for several hours on end, the maximum speeds being equal to those obtained on the relatively short-distance beam between England and Canada and higher than any other long-distance telegraph system operating to-day. During a continuous test of seven days the average traffic capacity exceeded 60,000 words per day in each direction, or approximately three times the minimum required in the latest agreement between the Commonwealth Government and Amalgamated Wireless (Australasia), Ltd. Communication tests are being continued, and negotiations are proceeding in relation to finalised traffic arrangements. As soon as these are completed and the British official tests are finalised the service will be opened for public traffic.

France.—International Telephony.—Paris is already well linked with the rest of the Continent by telephone, but improvements will shortly be made which will greatly facilitate international communication, especially with Great Britain. At present 18 circuits link France with Britain, 15 exist between France and Belgium, and 2 between France and Holland; before the end of the year this number will be increased to 21, so far as Britain is concerned, and additional lines are to be laid to facilitate communication with Holland and Belgium. The new Paris-Boulogne-London cable, which is to be completed before the end of the year, will permit of 100 simultaneous telephone communications between the two capitals. Additional lines are being constructed between Paris and Turin, Bale, Zurich, Berne, Geneva, Frankfort, Berlin, Lausanne, Mayence, Cologne, Hamburg, Prague, and Vienna.

The opening up of the new Paris-Milan circuit will permit of telephone communication between Paris and Venice. The Paris-Mulhouse cable has just been linked with the Swiss system, and will shortly also be connected with the German system at Appenweier (Grand Duchy of Baden). A system of relays will shortly enable Paris to communicate with Stockholm and Copenhagen *via* Berlin, and with Budapest *via* Frankfort and Vienna.—*Reuter* (Paris).

Greece.—Telephone Service.—It is announced that the Siemens and Halske Company has acquired 80 per cent. of the capital of the Greek Telephone Company, the former's investment being stated to amount to 10,000,000 marks. The so-called German telephone system is to be introduced into Greece.

Spain.—Radio-Telephony.—The newspapers report that the Government will shortly sign an agreement with the Argentine Radio Company for the establishment of direct wireless communication between Madrid and Buenos Aires by means of the station at Madrilene, Prado del Rey, which is one of the most powerful in existence. The service will probably be opened in six months' time, and later direct wireless telephone and radio-photographic communication will be established. Experiments which have already been made are stated to have been very successful.—*Reuter* (Madrid).

The Telephone Service.—Gloucester Automatic Exchange.—Gloucester City's telephone system has been changed from manual to automatic operation. The automatic equipment, together with the associated manual switchboard still necessary to preserve intercommunication with areas outside the city, has been manufactured and installed to the specification of the Engineer-in-Chief's Department of the Post Office by the Automatic Telephone Manufacturing Co., Ltd., the present capacity of the automatic equipment being 1,500 lines with provision for ultimate expansion to 2,700 lines. The system is 4-digit, and the first selectors are equipped with a digit-absorbing feature and 600-point banks. The object is to enable the first selectors to function as second selectors when subscribers whose numbers lie in the 2,000 group are required: when the first digit 2 is dialled, the shaft ascends, carrying the wipers to the second level, but before it can cut in to this level the mechanism is automatically released, and a relay prepares the bottom line bank wipers for the next digit. The digit-absorbing feature is now cut out for the remainder of the call and the selector functions normally. For example, should the second digit be 2, the shaft again ascends with wipers to the second level, cuts in, selects an idle trunk, and extends the connection *via* the bottom bank to a final selector on the 2,200 unit. Special traffic meters have been installed to enable statistics to be compiled for future guidance. On the manual switchboard suite six operators' positions were already existing, and sections have been added to bring the capacity up to present requirements. The main batteries, of Chloride Electrical Storage Company's manufacture, have a capacity of 756 ampere-hours. The charging motor-generator has an output of 95 amperes at 57 volts, and the ringing dynamotors are in duplicate, one designed to run off the supply mains, and the other off the exchange battery in series with an impedance coil: automatic change-over facilities ensure maintenance of ringing current. Supervision is of the usual high order. A one-position test desk and a one-position supervisor's desk complete this latest successful addition to the Post Office's rapidly growing list of provincial A.T.M. (Strowger) equipped exchanges now in active operation. The Gloucester automatic exchange was cut into public service on February 12th, the city's population being 51,330, so that there is approximately one telephone to every 34 inhabitants.

Letchworth System.—The telephone system at Letchworth was changed to full common-battery working on February 23rd, when a new No. 10 switchboard was brought into use, replacing the old c.b.s. system. The new switchboard has initial equipment for 600 lines and was made and installed by Siemens Brothers & Co., Ltd.

Transatlantic Radio-telephony.—Service Extension.—Recent extensions of the transatlantic radio-telephone facilities have made the service available from any place in Great Britain to any place in the United States of America.

Germany.—Some days ago the London telephone authorities invited the German officials in the Frankfurt-am-Main exchange to try to establish communication with New York *via* London. The line proved to be excellent, and the experiment has since been repeated. A report on these two experiments has been sent to the Reichs Ministry, says *The Times*, and application has been made for the institution of a regular service.

Holland.—The Hague correspondent of *De Telegraaf* understands that the Netherlands Post and Telegraph Administration intends shortly to undertake experiments with the object of establishing wireless telephone communication with North America *via* London and New York by means of the short-wave Marconi "beam" system. It is proposed to link up with the existing London-New York wireless telephone service by means of the submarine cable between Holland and Great Britain.—*Reuter* (Amsterdam). [There seems to be some confusion between the Marconi "beam" telegraph and the London-New York telephone services.—Eds.]

Radio Notes.

Germany.—Advisory Committees.—"Not supervision but promotion of broadcasting" was the motto suggested by State Secretary Dr. Hans Bredow, speaking as State Broadcasting Commissioner at the inaugural meeting of the Funk Stunde (Berlin) Advisory Committee (*Kulturbeirat*)—the first of a number of committees which will advise the existing broadcasting companies and replace the Programme Council which, after a life of only three months, expired on December 15th last. Their constitution was definitely stipulated in the broadcasting concessions granted to the companies a year ago. According to *World Radio*, apprehension has been expressed as to the effect of these officially appointed bodies, exercising only vaguely defined powers (except in so far as they suppress political tendencies) and without any definite responsibility, but Dr. Bredow does not share them.

Peru.—New Regulations.—The Government having taken over all broadcasting in Peru, station OAX has become State property and new regulations have been issued by the Administration of Posts, Telegraphs and Wireless applying to all receiving sets. It is pointed out that a licence does not authorise the use of a set for commercial purposes; that single-wire antenna must not be over 100 ft. long, nor double wire over 140 ft.; that the owner of a set may not use in any way whatever information so received, and that if the owner wishes to remove his set to another locality notice must be given previously to the Director of Radio Telegraph Services. Licences will not be transferable and they may be revoked by the Director should any of the regulations be infringed.—*Reuter's Trade Service* (Lima).

Russia.—High-power Stations.—The idea of erecting a 1,000-kW station, which has for some time been advertised widely in Soviet Russia, has been discarded as impracticable at the present moment, says *World Radio*. The Commissariat for Posts and Telegraphs has decided, however, that the immediate object of its constructive programme must still be to make multi-valve sets unnecessary by increasing the power of stations in several centres. There is much discussion as to what the power of individual stations should be, the most favoured proposal being that European Russia should have five or six stations of 25 kW (Moscow, Leningrad, Kharkoff, Tiflis, Saratoff, and Sverdlovsk *alias* Jekaterinburg), and about the same number of 10 kW each (Minsk, Kieff, Odessa, Kazan, and Rostoff-on-Don). Siberia presents a serious problem, being so vast and so thinly populated; the complete "radiofication" of Siberia has, therefore, been "postponed to the more distant future." A 10-kW station is being planned for Tashkent, to serve Turkestan.

South Africa.—Johannesburg Station Closes.—Lack of financial support has been the reason for the closing down of the "JB" (Johannesburg) station after having been in operation for over two years. Very strong efforts were made to enable "JB" to carry on, including a three-months' subsidy of £300 from the Johannesburg Municipality in the hope that some permanent arrangements would in the meantime be made to place the station on a sound footing, including Government support, but so far without effect. February 1st, however, was the time limit, and the station very reluctantly ceased to operate, but it was "on the air" again on February 5th, the Transvaal Radio League having arranged to carry on a partial service.

United States.—Proposed Censorship.—A Bill introduced by Assemblyman Edwin J. Coughlin, of Brooklyn, N.Y., at the present session of the New York Legislature in Albany, proposes the regulation and consorship of radio broadcasting. The Bill exempts from control stations owned by the Federal Government, by the State, and by a municipality. Privately-owned stations, however, would be required to obtain a certificate of necessity and convenience from the Department of Public Service. The annual licence fee for each station would be $100, and each would be required to deposit a bond of $10,000 as a guarantee that the rules and regulations laid down by the Public Service Commission would be observed. Under the terms of the Bill, the State would have jurisdiction over rates charged by commercial stations for broadcasting advertising matter, wave-lengths, and all pertaining to the operation of a broadcasting plant. The measure, if enacted, would become effective on July 1st, says *World Radio*, but existing stations would be permitted to operate without a licence until July 1st, 1928.

Control Bill.—The Wireless Control Bill was signed by President Coolidge on February 23rd. The Bill, which is intended to prevent any wireless interest obtaining a monopoly of the ether, provides for the establishment of a Federal Wireless Commission which will have power to make regulations and grant licences. After a year the powers vested in the Commission will be transferred to the Secretary of Commerce, but the Commission will remain in existence as a sort of court of appeal. The Bill was passed by the U.S. Senate on February 18th.—*Reuter* (Washington).

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the Electrical Review containing the advertisement is given in parentheses below.

Contracts Open.

Aberdeen.—March 10th. Northern Co-operative Society, Ltd. Refrigerating and cold store installation. Messrs. Tawse and Allan, architects, 10, Bon-Accord Square, Aberdeen.

Adwick-le-Street.—March 21st. Urban District Council. Cables, boxes, pillars, and necessary materials and apparatus for a distribution network scheme. (See this issue.)

Ashford.—March 14th. Electricity Department. Two electrically-driven centrifugal pumps (capacity 30,000 gal. per hour). (February 25th.)

Australia.—Melbourne.—April 26th. Postmaster-General's Department. Telephone switches. (B.X. 3254).* **Instrument** cords. (B.X. 3255.)*
April 12th. Cord-type switchboards. (B.X. 3280.)*

Brecon.—March 16th. Electricity Department. Generating plant and switchgear, battery of accumulators and connections, underground and overhead lines. (February 25th.)

Bridlington. — March 9th. Electricity Department. Stores for 12 months, including lamps, electrical sundries, v.i.r. cables, &c. (February 25th.)

Colwyn Bay.—March 11th. Electricity Department. Twelve months' supply of cables, joint boxes, house service cut-outs, joint-box compound, sundry stores, house service meters. (February 25th.)

Dover.—March 9th. Harbour Board. Electrical cables and sundries for a year. Mr. Rutley Mowll, registrar, Castle Street.

Durham (Co.).—March 12th. County Council. Electrical work for the Seaham Hall tuberculosis hospital. W. and T. R. Milburn, architects, 19, Fawcett Street, Sunderland.

East Ham. — March 10th. Electricity Department. 3,900 yd. cable. (See this issue.)

Edinburgh.—March 5th. Education Authority. Electrical work at the new Technical School. Mr. J. Carfrae, architect, 3, Queen Street, Edinburgh.
March 21st. Twelve months' supply of cables, box frames and covers, house service fuse boxes and fuseboards, meters and meter boards. (See this issue.)

Hazel Grove and Bramhall.—March 23rd. Urban District Council. One oil circuit breaker and kiosk and seven 20-kW transformers and kiosks, cables and two e.h.p. sub-station switchgear panels. (See this issue.)

Holmfirth (near Huddersfield).—March 8th. Electricians' work required in connection with the erection of a children's ward at Holme Valley Memorial Hospital, Elmwood. Mr. P. N. Brown, architect, Hollowgate, Holmfirth.

Ilford.—March 8th. Electricity Department. Twelve months' supply of house-service boxes, lamps, main cut-outs, meters, and pavement box covers. (February 25th.)
March 22nd. One 500-kW rotary convertor, with transformer, switchgear, &c. (See this issue.)

India.—March 22nd. India Store Department. Two 250-kW Diesel-engine alternator sets, with switchgear, transformer, &c. (February 18th.)
30,000 oil insulators. (See this issue.)
Delhi.—March 17th. India Stores Department. Oil-engine-driven generator sets with switchboard. (B.X. 3264.)*

Kettering.—March 23rd. Electricity Department. E.h.p. and l.p. armoured cables and one 1,000-kVA transformer. (See this issue.)

Lithuania.—Kovno.—March 10th. Department of Posts, Telegraphs and Telephones. Transformers, valves, &c., for the Kovno radio station. (B.X. 3283.)*

Littlehampton.—March 8th. Sussex Electricity Supply Co., Ltd. One 150-kW Diesel engine and generator, with auxiliaries, switchgear and cables. (February 18th.)

London.—Bermondsey.—March 16th. Board of Guardians. Six months' supply of electric lamps. Mr. H. H. Reeve, clerk to the Guardians, 283, Tooley Street, S.E.

Manchester.—March 18th. Electricity Committee. Three 500-kVA and two 250-kVA static transformers. (See this issue.)

Oldham.—March 7th. Board of Guardians. Electric lamps and fittings. Mr. Fred. W. Fletcher, clerk.
March 26th. Electricity Department. One 80-ton electric travelling crane. (See this issue.)

Rhondda.—March 26th. Electricity Department. Twelve months' supply a.c. ordinary and prepayment meters, mains and house service material. (February 25th.)

South Africa.—Johannesburg.—March 19th. Municipal Council. Single-phase concentric cable. (B.X. 3236.)*
Cape Town.—March 9th. Electricity Department. Insulated wire. (B.X. 3233.)*

South Elmsall.—March 19th. Electric lighting installation at Westfield Lane Council School. Education Department, County Hall, Wakefield.

Stoke-on-Trent.—March 8th. Electricity Department. De-aerating plant and electrically-driven boiler-feed pumps. (February 18th.) Twelve months' supply a.c. and d.c. meters, mains and cables. (February 25th.)

Torquay.—March 11th. Electricity Department. Two water-tube boilers with chain-grate stokers, induced draught plant, pipework and economisers. (February 18th.)
March 16th. One 6,000-kW turbo-alternator, with surface condenser and auxiliary plant. (February 25th.)

Tynemouth.—March 14th. Electricity Department. Three 250-kVA and one 500-kVA transformers. (See this issue.)

Warrington. — March 14th. Electricity Department. Motors and transformers. (February 25th.)

* Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Aberdeen.—Corporation. Accepted:—
Electric lighting work for the new buildings, including restaurant, dance-hall, pavilion, shops, &c., at the Beach. Malcolm & Allan (£2,354 and £1,012, respectively).

Barking Town.—Electricity Committee.
1,000-kW motor convertor:—

Metropolitan-Vickers Electrical Co., Ltd. ...	£3,750
Bruce, Peebles & Co., Ltd.	4,158
Brush Electrical Engineering Co., Ltd. ...	3,262
British Thomson-Houston Co., Ltd.	4,350
English Electric Co., Ltd.	3,750
General Electric Co., Ltd.	3,749
General Electric Co., Ltd.	4,037
Ateliers de Constructions Electriques de Charleroi. (Recommended.)	**2,875**

Bexhill.—Electricity Committee. Recommended:—
Cable (£4,122).—Enfield Cable Works, Ltd.
Three seven-way feeder pillars (£158).—W. T. Henley's Telegraph Works Co., Ltd.

Birmingham.—Education Committee. Accepted:—
Electric light installation, Stechford Council School.—Brightside Foundry and Engineering Co., Ltd.
Electricity Committee. Accepted:—
Three centrifugal pumps at Nechells generating station.—Pulsometer Engineering Co., Ltd.
Transformers for Selly Oak sub-station, Brush Electrical Engineering Co., Ltd.; switchgear, A. Reyrolle and Co., Ltd.; installation of electric light at Town Hall, Allom Bros.

Bradford.—Tramways Committee. Accepted:—
Tramway poles (£2,332).—British Mannesmann Tube Co., Ltd. (in preference to a Continental tender at £1,899).

Chelmsford.—Essex C.C. Accepted:—
Internal telephone system for the County Offices (£101).—Mr. A. Shearman.

Dundee.—Electricity Committee. Accepted:—
Cable (£572).—Standard Telephones & Cables, Ltd. (The lowest foreign offer was £521, by the Bergmann Electrical Works, Ltd.)

Guildford.—Electricity Committee.
Converting plant for central sub-station :—

British Thomson-Houston Co.	£15,506
Bruce Peebles & Co., Ltd. (Accepted.) ...	**13,648**
English Electric Co., Ltd.	13,469
General Electric Co., Ltd.	13,246
Metropolitan-Vickers Electrical Co., Ltd. (for part only)	9,965

Baths Committee. Accepted :—
Filtration plant at swimming baths.—Bell Bros.
Works Committee.
Additions to air compressor plant at destructor works :—

Mather & Platt, Ltd.	(*a*)	£1,656
Mather & Platt, Ltd.	(*b*)	2,412
Worthington, Simpson, Ltd.		2,150
Reavell & Co., Ltd.		1,393
Browett, Lindley & Co., Ltd. (Accepted.) ...		**1,490**

Hull.—Electricity Committee.
Additional turbo plant—

Oerlikon, Ltd.	£61,900
British Brown-Boveri, Ltd.	76,374
Brush Electrical Engineering Co., Ltd. (Accepted.)	**84,332**
English Electric Co., Ltd.	87,776
C. A. Parsons & Co., Ltd.	88,000
Richardsons, Westgarth & Co., Ltd.	88,900
Jas. Howden & Co., Ltd.	88,985
Metropolitan-Vickers Electrical Co., Ltd. ...	89,660
Fraser & Chalmers Engineering Works ...	90,655
Do. Do. ...	92,639
Metropolitan-Vickers Electrical Co., Ltd. ...	92,640
British Thomson-Houston Co., Ltd.	92,928
Peter Brotherhood, Ltd.	95,124
Do.	96,543
Do.	97,202
Do.	98,621

Ilford.—Town Council. Accepted:—
12 miles of cable (£7,051).—Union Cable Co., Ltd. This was the lowest British tender, and was £1,051 above the lowest quotation.

Leeds.—General Purposes Committee. Accepted:—
Electrical fittings for a year.—Sun Electrical Co., Ltd., and Mr. G. Casperson.
Electricity Committee. Accepted :—
Cable : (£9,027) Macintosh Cable Co., Ltd.; (£8,388) W. T. Henley's Telegraph Works Co., Ltd.; (£4,183) Enfield Cable Works, Ltd.; and (£1,225) Greenwich Cable Works, Ltd.
Portable air compressor (£750).—Lead Wool Co., Ltd.
Double transformer kiosk (£275).—Yorkshire Switchgear and Engineering Co., Ltd.
15 three-phase truck type switches (£1,433).—English Electric Co., Ltd.
Six two-phase truck-type switches (£550).—Ferguson, Pailin, Ltd.
Four transformer kiosks (£496).—Park Royal Engineering Co., Ltd.
Health Committee. Accepted :—
Electric lamps for Seacroft Hospital.—Nox Electric Lamp Co., Ltd.
X-ray plant at tuberculosis dispensary (£687).—Watson and Sons (Electro-Medical), Ltd.

Letchworth.—First Garden City, Ltd. Accepted:—
1,000-kW La Cour motor convertor.—Ateliers de Constructions Electriques de Charleroi.

London.—Admiralty. Accepted:—
Insulated electric cable.—Edison Swan Cables, Ltd.

Oldham.—Electricity Committee. Accepted:—
Three 250-kVA transformers.—Ferranti, Ltd.

Padiham.—Urban District Council. Accepted:—
Wiring 50 houses on the Dryden Street housing site.—Mr. R. B. Beattie (Burnley).

Salford.—Electricity Committee. Accepted:—
1,773 yd. e.h.p. cable and 11,100 yd. l.p. cable (£5,547).—N.V. Nederlandsche Kabelfabriek, Delft, Holland.

Sheffield.—Electricity Committee.
Sub-station switchgear (£11,132).—A. Reyrolle & Co., Ltd. (Accepted.)
Tramways Committee.
1,500 mild steel tie bars.—Hadfields, Ltd. (Accepted.)

Stoke-on-Trent.—Electricity Committee. Accepted:—
3-phase static transformers and truck-type sub-station switchgear for 12 months.—Metropolitan-Vickers Electrical Co., Ltd.
Steam and water piping at central power house (£14,100).—Brightside Foundry & Engineering Co., Ltd.
Constructional steel work at power station (£2,574).—W. J. Jenkins & Co., Ltd.

West Ham.—Education Committee. Accepted:—
Installing electric light at South Hallsville Schools (£460).—Corporation Electricity Department.
The tenders varied from £417 to £711.

Forthcoming Events.

Ideal Home Exhibition.—Olympia, W. March 1st to 26th.

Electrical Power Engineers' Association (Southern Division).—Friday, March 4th. Institution of Electrical Engineers, London. 7 p.m. "The Installation and Maintenance of E.h.p. Cables." Mr. E. Bowden.

(Glasgow Section).—Friday, March 11th. Reid's Restaurant, Gordon Street. 7.30 p.m. "Illumination." Mr. H. E. Hughes.

Junior Institution of Engineers.—Friday, March 4th. 39, Victoria Street, S.W. 7.30 p.m. "An Evening with the Old Brigade."
Saturday, March 5th. Suffolk Street Galleries. 6.30 p.m. Annual dance.
Friday, March 11th. "Cupolas." Mr. J. Wolstenholme.

London Association of Foreman Engineers.—Saturday, March 5th. Cannon Street Hotel, E.C. 6 p.m. Anniversary Festival.

Association of Mining Electrical Engineers (South Wales Branch).—Saturday, March 5th. Cardiff. 6 p.m. Discussion, "Can Electricity Replace Compressed Air in the South Wales Mines?"

London Lighting Service Bureau.—Evening Illumination Design Course : Concluding Lecture. Monday, March 7th. 7.30 p.m. "Selling Better Lighting." Mr. W. E. Bush.

Institution of Electrical Engineers.—Informal Meeting.—Monday, March 7th. London. 7 p.m. Discussion to be opened by Capt. P. P. Eckersley.

(North-Midland Centre). — Tuesday, March 8th. Hotel Metropole, Leeds. 7 p.m. Address by the President, Dr. W. H. Eccles, F.R.S.

(North-Western Centre). — Tuesday, March 8th. Engineers' Club, Manchester. 7 p.m. "Illuminating Engineering," Mr. J. W. T. Walsh; and "Problems of Public Lighting by Electricity," Mr. H. T. Harrison.

(Scottish Centre).—Tuesday, March 8th. North British Station Hotel, Edinburgh. 7 p.m. "High-power Fusible Cut-outs." Mr. L. G. Grant.

(South-Midland Centre).—Wednesday, March 9th. University, Birmingham. 7 p.m. "Illuminating Engineering," Mr. J. W. T. Walsh; and "The Problems of Public Lighting by Electricity," Mr. H. T. Harrison.

(Dundee Sub-Centre). — Thursday, March 10th. University College. 7.30 p.m. "The Jubilee Year of the Telephone." Mr. G. H. Taylor.

(North-Western Students' Section). — Saturday, March 5th. Manchester Municipal College of Technology. 7 p.m. Dance.

Institution of Rubber Industry.—Monday, March 7th. Engineers' Club, W. "Some Electrical Properties of Rubber." Mr. P. Dunsheath.

Society of Engineers.—Monday, March 7th. Burlington House, W. 5.30 p.m. Ordinary meeting.

British Electrical Development Association (North-East Area).—Wednesday, March 9th. Sopwith's Lounge, Newcastle-on-Tyne. 7 p.m. Discussion on W.O.B. Campaign.

Birmingham Electric Club.—Friday, March 11th. Grand Hotel. 7 p.m. Annual Dinner.

Physical Society.—Friday, March 11th. Imperial College of Science, South Kensington. 5 p.m. Ordinary meeting.

Notes.

British Insulated Cables, Ltd., Secures Big Contract for Indian Railway Electrification.

At the present time, when industry has to rely to such an extent on orders from overseas, it is of interest to note that British Insulated Cables, Ltd., of Prescot, has secured the contract for the main-line electrification of the Great India Peninsula Railway (Indian State Railways). The contract involves the equipment of 334 miles of track, running from Kalyan to Igatpuri in a northerly direction, and from Kalyan to Poona in a southerly direction, including sidings, storage yards, &c. The line to Poona includes the special equipment of the "Ghats," a particularly mountainous region, and about four miles of tunnels. The overhead equipment contains several novel features. The total section of copper to be carried per track is one square inch divided into three parts: 0.5 sq. in. main catenary, 0.2 sq. in. auxiliary catenary, and 0.3 sq. in. British standard section grooved contact wire. The main catenary is suspended at 220 ft. intervals by double porcelain disk insulators of the ball and socket pattern, and the contact wire is suspended by loop-type droppers from the auxiliary catenary, thereby providing an exceedingly flexible line. Provision for tensioning is made at distances of approximately one mile, and at these points every cable is dead-ended, the continuity of contact being maintained by a patented form of overlap span, which permits the tension stresses to be balanced, and so reduces to a minimum the amount of steel required in the structures at these points. Current is transmitted at 120,000 volts a.c. to sub-stations, where it is transformed to 1,500 volts d.c. for feeding the line.

Lake Lugano as a Reservoir.

For some time past engineering circles at Milan have been considering the use that can be made of the waters of the river Tresa, by means of which Italian river the overflow of the Lake of Lugano escapes; it is rumoured that the idea of Italian engineers is to utilise the difference of levels between the lakes of Lugano and Maggiore. A powerful waterfall would be thus constructed, capable of feeding considerable hydro-electric works, the buildings of which would naturally be erected on Italian soil. It is asserted that the greater part of the capital necessary for the enterprise has already been subscribed. The result of such a project would certainly have distinct repercussions in Switzerland, and the scheme is being followed with the greatest attention by the Tessinois Government. The building of a power house fed by the waters of the Lake of Lugano has a bearing on the question of the lake-level, which would be menaced or modified by the operation of hydro-electric works. Several of the lake-shore villages have already voiced their anxiety as to possible changes in water supply, and it is urged that the proposed use of the Lake of Lugano as a reservoir for Italian industry would be disastrous for certain Swiss villages on its banks. Swiss authorities, therefore, are keeping a sharp look-out on the developments of the plans that are being drawn up at Milan.

The Electricity (Supply) Act, 1926.

We have received from the Electricity Commissioners a "Memorandum on the Provisions of the Act" which they have prepared (H.M. Stationery Office, price 3d. net, post free 3½d.). It is announced by the Stationery Office that the Act has been reprinted, and the price reduced to 9d. net (post free 9½d.).

A New Electrical Illuminant.

A demonstration was recently given to the Press by Messrs. Fluor Light, Ltd., at their Shaftesbury Avenue, London, showrooms, of their new electrical illuminant, "Fluor Light," the invention of Mr. Ashton Wolfe, which they are introducing to the public. The light is produced in vacuum tubes at high voltage, 3,000 to 5,000 V, and by means of special electrodes at the ends of the tubes, containing a substance with a radium basis, gases are introduced which control the ether vibrations and thereby define the actual colour waves of the light. The gas also serves as a stabilising medium and renders the lighting, after a short period, quite steady. In addition to the variety of colours which can be obtained by this means for effective lighting, a most important feature is the production of true natural light, which should prove of great value in connection with colour matching in dye works and so on, and also to the medical profession, which, it is claimed, is giving the new illuminant favourable consideration. Another interesting feature is the possible production of only those light waves which are capable of penetrating fog, and this was demonstrated to some extent by creating an artificial fog in the room. The illumination was not obscured to any perceptible degree, and there was no halo observable around the light. It is claimed that the current consumption is 60 per cent. less than that for ordinary electric lighting by means of "half-watt" lamps. It is hoped to develop this means of illumination for ordinary house interior lighting by installing the tubes in a similar manner to ordinary cornice-lighting apparatus. The system has already been adopted for illuminated signs, and also for shop-window lighting. In the latter case the transformer and tube terminals and the leads are enclosed in glass tubing to afford adequate protection against accidental shock. The system can, of course, only be employed with a.c. supply.

The Electrification of French Railways.

The commercial counsellor at Paris informs the Department of Overseas Trade that the Southern Railway Co. is about to push on with its electrification programme, which has been temporarily in abeyance. It is stated that several lines will be completely electrified, including those from Pau to Laruns and from Pau to Bedous, with an extension to the international frontier station at Los Aranones. The last-named line will be operated in the course of 1928. The work is making rapid progress; the rails have been laid and stations are being built.

The British Legion.

The annual report of the British Legion shows that it has developed steadily on sound lines, and now has 2,774 branches in England and Wales. Unemployment was rife last year, but up to September 30th, 423 ex-service men had been placed, 2,625 introductions given, and 5,536 applicants for employment interviewed. Men are being trained in workshops, and others prepared for emigration. The number of disabled ex-service men registered at Employment Exchanges at the date of the report was 28,676, as compared with 32,350 in December, 1925. A full account is given of the administration and activities of the Legion. The relief fund (nine months) expended £147,092 on the relief of distress and for similar purposes.

Electrical Association for Women.

The first annual conference of the Birmingham and Midlands Branch of the Association was held recently at Birmingham, and was largely attended.

Mrs. Christine Frederick, in an address, pointed out the advantages secured by the use of mechanical appliances, but added that for their proper use a full and universal electricity supply at moderate rates was necessary.

At a luncheon presided over by Lady Brooks, president of the branch, Mr. H. K. Beale, chairman, Birmingham Electric Supply Committee, said that if any ladies were thinking of installing electricity in their homes, he would give them a tip: start with a kettle. Once it was seen how quickly and easily an electric kettle could be brought into operation, the rest of the household would be converted.

Mr. R. A. Chattock, city electrical engineer, said he was convinced that the women of this country would eventually insist on their homes being provided with electricity. Dr. S. Z. de Ferranti remarked that the great thing that stood in the way of electrical development was a general want of knowledge of the handling of the commodity and the apparatus connected with it. Visits were paid to the Nechells power station and the Witton Works of the General Electric Co., Ltd.

At the annual meeting of the branch, Professor W. Cramp said that the problem of cheaper electricity in this country would not be solved until that of electrical storage was solved.

The annual general meeting of the Manchester District Branch of the above Association was held on February 22nd, the chair being taken by Alderman Dagnall, chairman, Manchester Electricity Committee, when it was decided to re-elect all the officers and members of the committee. The meeting was followed by a lecture by Mrs. Christine Frederick, U.S.A., who described the methods adopted by American housewives to save labour in the home.

Faraday House Old Students' Association.

The Association has arranged to hold a dance on March 18th (8 to 12 p.m.), at Bush House Restaurant, Aldwych, in co-operation with the Faraday House Rugby Club. The dance will be the first of its kind and in some respects will take the place of the annual smoking concert. The price of the tickets is 8s. double (including light refreshments).

A Memorial to Faraday.

As we go to press we have received the following letter, with the tenor of which we cordially agree:—

I have read with great interest and appreciation the letter to you from the Mayor of Southwark published in your last issue, and think that he and the Borough of Southwark are to be congratulated upon the action it is intended to take in this matter.

It has always seemed to me that outside purely scientific circles the work of Faraday and the nature of its presentation to the public by him have received quite inadequate recognition. Of course, after the great lapse of time and under the stress of modern conditions of living and working, it is not easy for the present generation of electrical men to recognise and appreciate what it owes to his work and to the impetus it gave to the founding of our great industry.

But the efforts now being made by Mr. Hewitt serve as a reminder in this matter, and it is sincerely to be hoped that they will meet with complete success. With this object it is certain that the Electrical Review will be in complete sympathy.

A. C. Eborall, M.Inst.C.E., M.I.E.E.

Trafalgar House, S.W., *March 1st*, 1927.

Ideal Home Exhibition.

The eleventh Ideal Home Exhibition was opened at Olympia, London, on March 1st by the Hon. Mrs. Esmond Harmsworth. Many new features, both with regard to the decoration and lay-out of Olympia itself and the exhibits, are introduced this year. There are quite a number of electrical firms showing, and we hope to review their exhibits in a later issue.

Molybdenite as a Photoelectric Material.

According to Dr. W. W. Coblentz, of the U.S. Bureau of Standards, a piece of the mineral molybdenite, one of the chief sources of the metal molydenum, may replace the fragile photoelectric cell in some forms of scientific work. Dr. Coblentz has been studying what he calls the antinoelectric effect of molybdenite, the property that causes it to convert light energy falling on it into electrical energy. Previously he found that pieces of the mineral had closely adjacent spots which generated either positive or negative electricity. The result was that when the whole crystal was exposed to light the positive and negative currents neutralised each other, and very little effect was noted; but if a single spot was selected and illuminated, a current was produced of sufficient intensity to be indicated by a galvanometer. Recently, however, Dr. Coblentz has found crystals of which all the sensitive spots give the same kind of electricity, either positive or negative. When one of these crystals is completely illuminated, a considerable current, as compared with the others, is produced. By using vacuum tube amplifiers, the current may be magnified greatly and the crystal made available as a delicate detector of light. Such a crystal is sensitive to visible light waves and to the infra-red, or heat waves.—*Science.*

Electric Heating with Thermit Welding.

Electric heating has now been applied in connection with thermit welding by the Metal and Thermit Corporation, Jersey City, N.J., which has introduced heating units on its track-welding equipment to assist the vaporisation of the kerosene oil used for preheating the work. The oil is passed through the heating unit and is then mixed with compressed air at approximately 1 lb. pressure, after which it passes through a rubber hose to the torch used in applying heat to the rails. The heating unit also acts as a resistor. The equipment is electrically operated from the standard trolley circuit, and the group of two heating units connected in series is placed in series with the 230-volt d.c. motor that drives the air compressor. With this arrangement a snap switch can be used to start the motor as the heating units act as starting resistances.—*Times Trade and Engineering Supplement.*

Appointments Vacant.

Assistant mains engineer (£238) for the Peterborough Corporation Electricity Department. Mechanical and electrical draughtsman for the Air Ministry, W. & B. Department, Egypt. Temporary shift engineer for the Crewe Corporation Electricity Department. Plumber-jointer for the Hove Corporation Electricity Department. (See our advertisement pages to-day.)

The Engineers' Club (London).

During March eighteen meetings are being held at the Engineers' Club, including those of the Wireless Section of the I.E.E., the A.M.E.E., the Institute of Wireless Technology, and the Junior Institution of Engineers.

Battery Electric Rail Cars.

Recent annual reports of the railway companies of this country do not make pleasant reading. At a time when they are bemoaning their fate the lack of evidence of more apparent consideration being devoted to means of more economically utilising the many miles of expensive permanent way that exist in the form of country and branch lines seems strange. A steam locomotive hauling a normal train of from six to eight composite coaches is anything but pleasing if the carriages be nearly empty, and the only way of reducing the wasteful expenditure represented by such trains is to operate short ones on lines of that nature during those periods that traffic does not warrant the use of a standard train: in other words, a 'bus car on railway lines run often enough to ensure that reasonable service is provided. There are, of course, various methods of doing this, and undoubtedly there lies in this connection a great field for the use of battery electric coaches: Germany has found such vehicles to be quite a sound proposition, and an example in England was cited in our issue of February 18th, 1927, p. 264, whilst the installation of a rail-car service on the New Zealand Railway between Christchurch and Oxford West has proved so successful from the passengers' point of view that people deliberately wait for the electric car rather than travel by the steam train! An account of this interesting innovation appears in the *Electric Vehicle*, which commends the idea to the attention of those responsible for railway operation in this country.

Electrification of steam lines is admittedly a costly process, but fortunately the advantage of electric traction can be obtained without the necessity of electrifying the track; battery electric shunting locomotives have proved an eminently practical and economical proposition, while by keeping down the weight of the coach to a minimum, in some ways deviating from the expensive and heavy methods of construction that are employed in present-day railway coach design, it is quite practicable to produce a battery-driven coach that will prove a real boon both to railway companies and passengers on country lines, and for suburban services during the development period. Charging the batteries could be carried out at night, when electricity could be obtained at very favourable rates, or in areas where a public supply of electricity is not available petrol-electric charging stations could be installed (and used possibly during the day for giving a supply of power to consumers in the locality of the station).

The battery electric coaches for use on the branch line of the New Zealand Railways are designed on modern lines; the cars are fifty-five feet in length over the vestibules, seating accommodation being provided for 60 passengers in comfortable upholstered seats fitted with reversible backs. The two compartments are well lighted by wide windows, extending practically the full length of the car. The seats are spaced transversely on either side of a central aisle and, for night operation, electric light is supplied from a separate battery. While being tried in the Lyttleton-Christchurch service the first car was frequently called upon to carry as many as 140 passengers, and easily handled the heavy overload without any apparent effort. Power for the four 30-h.p. motors is supplied from 240 type A12.H Edison cells, sufficient for a 100-mile run under ordinary service conditions. This car was designed to maintain a speed of 35 miles per hour, but actually it has attained a speed of 40 miles per hour on long straight runs, and under service conditions a schedule speed of 35 m.p.h. is easily maintained. The car is provided with hand, straight-air and dynamic braking, the latter being primarily intended for holding the car to a reasonable speed on long down grades without the usual heavy wear on the brake blocks and wheels; the car is charged at night during "off peak" hours when power is available at a very low rate, and a return journey of 84 miles was accomplished with an expenditure of electrical energy from the battery amounting to 335 amp.-hours; the outward journey, owing to the gradients encountered, took about fifty per cent. more electrical energy than the homeward journey, for a considerable part of which the train was coasting. When it is not desired to take advantage of economies resulting from the design of lightweight coaches, it should be possible to convert old-type saloon coaches to battery electric coaches, and thus at minimum cost to put into operation electric motor-coach trains on lines at present expensively served by the usual steam locomotive of a size greater than the traffic calls for.

Fatalities.

A verdict of "Accidental death" was returned at the inquest on February 23rd on Mrs. Elizabeth Waterworth, who died recently from injuries received in an explosion that wrecked a house and shop in Beaconsfield Road, Acton Green. Evidence was given that fire was noticed to start where an electric cable entered the shop. It was stated that a few minutes before the explosion the electric light flickered and went out in a bakehouse 100 yards away. An electrician said that the distributor crossing the road to the premises had been partly blown out. A feeder cable laid in the road 25 years ago was encased in bitumen, but the distributor was modern, and had no connection with any bitumen. Periodical overhauling was carried out. The jury found that the explosion was accidental, but could not say how it was caused. It added a rider that the cable should be thoroughly overhauled.

The Times reports that Edward Brown, a Southern Railway driver, was killed by an electric shock on February 24th at Sutton station through his head touching an overhead electric wire while he was standing on the coal in the tender.

An inquest was held on February 16th, on the death of W. J. Thomas, of Trecynon, a shift engineer, employed by the Aberdare District Council for 12 years at the tramway depôt, who was killed by an electric shock on February 13th. According to the evidence reported in the *Aberdare Leader*, the deceased was working in a cubicle which had been made "dead"; nevertheless he touched live metal and was instantly killed. The switch, though interlocked, was found "just on." The verdict was "Death by misadventure."

An E.P.E.A. Dinner.

A company of over 100 attended the eighth annual dinner of the Portsmouth branch of the Electrical Power Engineers' Association, which was held at Kimbell's Café, Southsea, on February 19th. Mr. J. Ryan, chairman of the South Coast Section of the Association, presided, and among those present were Alderman A. Hemingway (chairman of the Portsmouth Electricity Committee), Mr. B. Handley, engineer and manager of the Portsmouth undertaking, and the Mayor and Mayoress of Chichester. The great developments that had taken place in the electrical world during the last 25 years were spoken of by Mr. H. Martin, Senior Electrical Engineer at Portsmouth Dockyard, in proposing "The Electrical Industry," and the beneficial effect of electricity upon health and comfort in home life was referred to by Alderman A. Hemingway in response. Councillor W. J. Lewis, vice-chairman of the Portsmouth Committee, also spoke of its potentialities in the future. Mr. Handley proposed "The Electrical Power Engineers' Association," remarking that the policy which the Association had pursued since its inception showed that it possessed wisdom, despite its youth. The conditions existing in the industry to-day, he added, had been largely obtained by the Association's efforts, and had been procured with hardly any turmoil at all. The Association had also got out a very good apprenticeship scheme. The chairman responded, and pointed out that the Association was not entirely out for remuneration. An excellent musical programme was arranged, and the evening concluded with dancing.

Institution Notes.

Institution of Electrical Engineers.

INFORMAL MEETING.—On February 21st, Mr. M. Whitgift was in the chair when Mr. R. O. Kapp opened a discussion on "National Bus-bars in Central Europe," describing his remarks as notes compiled on a holiday last year, but they showed a close and comprehensive survey of a large part of Austria, Germany, and Switzerland. He also had a number of slides showing the areas covered by interlinking, and remarked that Switzerland was the only country with an entire set of national bus-bars; they had come about by natural development into a complete system, but, consequently, without uniform voltages. Austria, with very little coal, but with much water-power, had turned to electrical development to help solve the problem of her acute post-war poverty, and truly remarkable progress had been made. The hydro-electric stations were detailed, and the great undertaking at Aachensee described in some detail, for from this station export of surplus power to Germany and Switzerland was now arranged. Germany had as yet no continuous system, but very extensive sets of mains carried power at 110,000 V over large areas. Long lines now operating at 110,000 V, it was contemplated, would be raised to 220,000 V, and were even designed for 380,000 V. An excellent discussion followed. Mr. W. E. Highfield said that Mr. Kapp had made extraordinarily clear the outline of the systems described. With regard to the comparative immunity from breakdown which was reported on the 110,000-V lines, Mr. Highfield said he had noticed that long spans of line had a better vibration period and often suffered fewer stresses. He had observed, too, that with the supply to rural districts in South France the saving in cost was not made on the h.p. lines, but on the l.p. distribution.

LONDON STUDENTS' SECTION.—Improvements have been made in the programme for the second half of the session. To-night there will be a theatre party at Victoria Palace, an item which has just been re-instituted after a lapse of two years. Next Friday there will be a joint meeting with the Students' Sections of the Institutions of Civil and of Mechanical Engineers for a discussion on "Patents," to be opened by Mr. A. C. Price, and on Friday, March 18th, the twentieth annual dinner will be held at the Imperial Hotel, Russell Square. This year the dinner will be more enjoyable and informal than usual. Dr. W. H. Eccles and Capt. P. P. Eckersley have promised to be present.

Association of Consulting Engineers (Incorporated).

On Wednesday last week the annual dinner of the Association was held at St. Stephen's Club, Westminster, about 150 members and guests sitting down, with Mr. W. J. E. Binnie, chairman of Committee, presiding. Amongst those present were Sir Charles Parsons, Sir Joseph Cook, Sir Alex. Gibb, Sir Harry Haward, Mr. W. W. Lackie, Sir Halford Mackinder, Mr. C. le Maistre, Sir Ernest Moir, Col. R. K. Morcom, Mr. Basil Mott, Mr. S. L. Pearce, Col. T. F. Purves, Lord Queenborough, Sir Henry Slesser, Sir Henry Tanner, and Mr. T. P. Wilmshurst. After the loyal toasts, Sir Cyril Kirkpatrick proposed "The British Empire," remarking that the work of engineers brought its components closer together—aviation in particular was annihilating time and space. The Hon. Mr. J. S. Smit, High Commissioner for the Union of South Africa, in responding, repelled the charge that South Africa preferred foreign markets to the British. Mr. S. C. Lewis proposed "The Bench and Bar," Lord Hanworth, Master of the Rolls, and Mr. W. E. Tyldesley Jones responding. The toast of "Science" was proposed by Lt.-Col. N. G. Gedye, who emphasised the close interdependence of pure science and engineering in these days; Dr. J. V. Elsden, responding, pointed out that the pure science of to-day was the applied science of to-morrow. Mr. Fredk. Palmer, president, Inst.C.E., proposed "The Association of Consulting Engineers," and the chairman, responding, said that the Association owed a debt of gratitude to the honorary officers, especially the hon. secretary, Mr. A. H. Dykes, who devoted an immense amount of time and labour to its interests. The hon. treasurer, Mr. S. R. Lowcock, having resigned, the members had presented him with a desk and bookcase; Mr. S. C. Lewis was his successor. Mr. Lowcock was called upon to speak, and expressed his grateful appreciation of the present and of the very great kindness he had experienced from the members during the past 20 years.

Junior Institution of Engineers.

At the meeting held on February 25th, Dr. C. M. Walter showed a number of photographs and four kinematograph films taken by him during his recent visits to the Norwegian fjords, which held the interest of the members for over two hours. To-night the "Evening with the Old Brigade" will be opened at 7.30 p.m. by Mr. Walter T. Dunn, M.I.Mech.E., secretary of the Institution for the first 27 years, and member for 43 years; afterwards past-chairmen successively will occupy the chair, and lecturettes will be delivered by other members of long standing.

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.

Representatives of East Midland electricity authorities assembled at Nottingham on Thursday last week, when a presentation was made to Mr. T. P. Wilmshurst, late borough electrical engineer of Derby, in recognition of his appointment as an Electricity Commissioner. Mr. Wilmshurst was invited to accept a small copy of the historic vase which forms one of the notable treasures of Warwick Castle, and he was also given a wristlet watch. Alderman Huntsman, who made the presentation, observed that in the area covered by the operations of the Board of which he had the honour of being the chairman, they had never faltered in their support of the technical policy to which the new Act was intended to give effect. That area was about the only one in which stubborn opposition had not been presented to the policy. His only doubt about the future success of the policy which should be carried out was that its execution would have to be entrusted to some of the men who had been its most strenuous opponents. The electricity supply industry had been singularly fortunate in having had at its disposal the services of those who constituted the Electricity Commission, who were not only technically eminent, but were also just, courteous, and devoted to the public interest. In the East Midlands area the authorities had prepared themselves to co-operate in carrying out whatever might be called for with regard to a larger policy. They would, however, be poorer in that area by reason of the circumstance that he who had presided over other able electrical engineers and who had guided their footsteps, would be no longer with them to give them the benefit of his knowledge. He felt that they owed a vast debt to the wise judgment of Mr. Wilmshurst. Mr. Wilmshurst, in responding, observed that one reason for the friendly feeling which prevailed in the area was to be found in the large humanity of the chairman of the Board, Alderman Huntsman. An excellent example was furnished by the time and ability which such men as he devoted to the public service. He believed that the new Act constituted a great landmark in the electrical history of the country. It had been suggested that it would prove of no use to towns which were making cheap electricity; but it should be remembered that two-thirds of the places in the country had either no supply at all or only poor supplies. The Act would not rectify everything at once, but it would provide "tapping points" in rural districts, so that a supply could be given at a reasonable price. The scheme for central industrial Scotland was now completed and ready for transmission to the Board, and that for Central England, embracing the territory from North Derbyshire to the Thames, would be ready for transmission within the next two or three months. These schemes had been prepared with the most meticulous care. Not a single authority would be penalised by the Act, and when all the transmissions had been completed every authority in the country would benefit therefrom.

The Government *Gazette*, Gold Coast Colony, recently announced that Mr. F. T. BILLINGSLEY, assistant electrical engineer, Gold Coast Government Railways, had been appointed to act as chief electrical engineer to the Railways from November 7th, 1926.

Dr. S. Z. DE FERRANTI has been selected by the Council of the Royal Society for election as a Fellow of that body.

The Lancaster Town Council last week decided to increase the salary of Major G. C. MILNES, M.C., the borough electrical engineer since 1910, from £680 to £780.

The Leeds Corporation Electricity Committee recommends increasing the salary of Mr. C. NELSON HEFFORD, the manager of the Electricity Department, from £1,600 to £1,650 per annum.

At a social gathering at Keyham in connection with the electrical department of Devonport Dockyard, a presentation, consisting of a pair of binoculars, was made to Mr. HOWE, assistant electrical engineer, upon his approaching departure for Gibraltar.

On resigning his position as electrical engineer at the Winwick Mental Hospital, Mr. A. DAVIS was presented with a gold watch by the staff.

Dr. S. ENGLISH, D.Sc., F.I.C., F.Inst.P., late Senior Lecturer in the Department of Glass Technology, Sheffield University, has joined the staff of Holophane, Ltd., as Research Engineer, in connection with the use of glass in all types of illumination.

Obituary.—SIR J. HARMOOD-BANNER.—We regret to record the death of Sir John Sutherland Harmood-Banner, which occurred on February 24th, at the age of 80 years. By profession he was an accountant and had very large business interests. He was a member of the House of Commons for many years. The honour of knighthood was received in 1913, and he was created a baronet in 1924. He was very closely associated with the electrical industry and at the time of his death was vice-chairman of the following companies:—British Insulated Cables, Ltd.; Midland Electric Corporation for Power Distribution, Ltd.; the Electric Supply Co. of Victoria, Ltd.; the Electric Supply Co. of Western Australia, Ltd.; and the Telegraph Manufacturing Co. (Colonial), Ltd. He was also a director of the Automatic Telephone Manufacturing Co., Ltd., and the La Plata Electric Tramways Co., Ltd.

Mr. C. E. Davies.—The death has occurred, at his residence, Church End Farm, Billingham, following an attack of pneumonia, of Mr. C. E. Davies, electrical engineer on the staff of the Chief Engineer to the Synthetic Ammonia and Nitrates, Ltd., Billingham, near Stockton. Mr. Davies, who was 54 years of age, had had a wide experience in electrical engineering, in London, Cardiff, and South Wales. He went to Billingham about five years ago from the British Thomson-Houston Co., Ltd., Rugby.

Mr. R. W. Hogarth.—We regret to learn of the death of Mr. Robert W. Hogarth, senior partner in the firm of Buchan and Partners, consulting engineers, of London and Edinburgh. Mr. Hogarth, whose years did not number many over fifty, is described as a pioneer in Scottish water power utilisation, and as being prominently identified with important Scottish electrical development schemes, including the Fall of Clyde hydro-electric scheme, for which he acted as consulting engineer to the promoters.

Mr. H. O. H. Wenman.—The death has taken place at Smethwick of Mr. H. O. H. Wenman, who was the pioneer of electricity at Bishop's Castle, Salop. Many years ago he purchased the old gasworks, where he installed electrical plant.

Dr. Luigi Casale.—Quoting the *Chemical Age*, the *Daily Telegraph* reports the death at Milan of Dr. Luigi Casale, inventor of the Casale process for the fixation of atmospheric nitrogen.

Ald. J. W. Henderson.—The death has taken place suddenly of Ald. John Watt Henderson, chairman of the South Shields Corporation Electricity Committee and a former mayor. He was for many years vice-chairman of the Tramways Committee.

Wills.—The late Mr. C. L. Troup, electrical engineer, of Victoria Dock Road, Canning Town, left £5,518 net and £7,977 gross personalty.

The late Sir Francis Fox left £40,615 gross and £32,345 net personalty.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

W. G. Hodgson & Co., Ltd.—Private company. Registered February 24th. Capital, £1,000 in £1 shares. Objects: To acquire the business of an electrical engineer and contractor now carried on by W. G. Hodgson at 7 and 8, Broad Street, Cheapside, E.C., as "W. G. Hodgson & Co." The permanent directors are:—W. G. Hodgson, A.M.I.E.E., 24, Nella Road, W.6, electrical engineer; Mrs. E. Hodgson, 24, Nella Road, W.6. Qualification, £100 shares.

Phone Conversion, Ltd.—Private company. Registered February 22nd. Capital, £3,000 in £1 shares. Objects: To carry on the business of electricians, mechanical engineers, manufacturers and workers of and dealers in electricity, manufacturers of and dealers in wireless apparatus, &c. The subscribers (each with one share) are:—A. Marr, 23, Reynell Road, Longsight, Manchester, telephonic expert (late Lieut. R.A.F., Technical); Col. A. Young, 135, Colinton Road, Edinburgh, surgical instrument manufacturer. A. Marr is permanent governing director. Qualification, £100. Registered office: Leinster Chambers, 4, St. Annes Square, Manchester.

J. L. Gottlieb & Co., Ltd.—Private company. Registered February 21st. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in drawn wire, electric cabling, electric lamps, and all parts used in connection with electrical, telegraphic, telephonic, and wireless instruments, &c. The first directors are:—Miss Kathleen Hosler, 19, College Road, Bromley, secretary; J. L. Gottlieb, 10, Hillcrest Avenue, Golders Green, N.W.11, merchant (permanent). Secretary: F. Lacey. Registered office: 89, Upper Thames Street, E.C.4.

Red 'Phone Book (Newcastle), Ltd.—Private company. Registered February 22nd. Capital, £500 in £1 shares. Objects: To adopt an agreement with The Trade Telephone Books, Ltd., to carry on and develop the business of publishers of "The Red X Phone Book," &c. The first directors are:—D. I. Munro, "Lynn Garth," Gowland Avenue, Milvain Estate, Newcastle-on-Tyne; J. W. Driffield (permanent managing director), 6, Curtis Road, Newcastle-on-Tyne. Qualification, £10 shares. Solicitor: V. Hadaway, 50, Pilgrim Street, Newcastle-on-Tyne.

Lincoln Radio Supplies, Ltd.—Private company. Registered February 25th. Capital, £500 in £1 shares. Objects: To carry on the business of manufacturers, assemblers, installers and repairers of wireless telegraphic, television and telephonic apparatus, &c. The directors are:—C. W. Cottam, 15, The Strait, Lincoln; A. G. Shipley, The Limes, Lindum Terrace, Lincoln. Qualification, 50 shares. Secretary: H. R. Sharpe. Solicitors: Langley, Stevens & Phillips, 34, Silver Street, Lincoln. Registered office: 14, Silver Street, Lincoln.

British Electric Meters, Ltd.—Private company. Registered February 24th. Capital, £50,000 in £1 shares. Objects: To acquire from R. W. Jolly, N. B. Coop and Meters, Ltd., certain letters patent or patent rights relating to electric meters; and to carry on the business of manufacturers of electric and other meters, dynamos, magnetos, storage batteries, electric motors, lamps, bells, horns, telephones, telegraphs, &c. The subscribers (each with one share) are:—R. W. Jolly, 10, South Park Road, Wimbledon, S.W.19, electrical engineer; N. B. Coop, "Hartford," Ebbenston Road, Colwyn Bay, electrical research engineer. The first directors are to be appointed by the subscribers. So long as Meters, Ltd., holds more than one-half of the capital, it may appoint five directors. Qualification, £200 shares. Manager: R. W. Jolly. Solicitor: J. R. Knott, 103, Union Street, Oldham. Registered office: 45, Westminster Bridge Road, S.E.1.

Clear Hooters, Ltd.—Private company. Registered February 16th. Capital, £2,000 in £1 shares. Objects: To carry on the business of manufacturers of, agents for and dealers in electric horns and hooters, and all kinds of electrical, mechanical, and other signalling devices, &c. The first directors are:—J. H. Mills, Heath Lea, Castle Bromwich, motor accessory manufacturer; T. S. Rogers, 25, Edmund Lane, Saltley, Birmingham; L. J. F. Austin, "Sherington," Hadzer Road, Warley, Worcs., C.A. Qualification, 2 shares. Registered office: Lichfield Chambers, 1-2, Upper Priory, Birmingham.

Official Returns of Electrical Companies.

Walker, MacEwen & Co., Ltd.—E. H. Willoughby, of 63, Loraine Mansions, N.7, was appointed receiver (in place of E. L. Holford), on February 8th, 1927, under powers contained in debentures dated November 30th, 1922.

Deansgate Electric Radio (Manchester), Ltd.—C. A. Leeming, of 11, Dartmouth Road, Whitefield, Manchester, was appointed receiver and manager on February 9th, 1927, under powers contained in debenture dated January 10th, 1927.

Almondsbury and District Electric Supply Co., Ltd. (183,582).—Capital, £3,000 in 1,000 preference and 2,000 ordinary shares of £1 each. Return dated December 16th, 1926. 1,000 preference and 1,115 ordinary shares taken up. £2,115 paid. Mortgages and charges, nil.

Auto Mechanical Rectifiers, Ltd.—R. S. Andrews, of 448, Strand, W.C.2, ceased to act as receiver or manager on February 14th, 1927.

Electricity Distribution of North Wales and District, Ltd.—Second mortgage debenture dated February 10th, 1927, to secure £150,000, inclusive of £100,000 secured by charge dated March 12th, 1926, already registered, charged on certain freehold and leasehold properties at Rhyl, Meliden, Denbigh, Sandbach, Alsager, Elsworth and Flint, and the company's undertaking and property, present and future, including uncalled capital. Holder: H.M. Treasury Solicitor.

Newton Brothers (Derby), Ltd.—Satisfaction in full (1) on January 10th, 1927, of mortgage dated May 29th, 1923, securing £12,000; and (2) on February 11th, 1927, of debentures dated September 16th, 1925, securing £50,000.

East Lancashire Electrical Co. (Accrington), Ltd. Capital, £3,000 in £1 shares. Return dated August 10th, 1925 (filed January 15th, 1927). 1,475 shares taken up. £1,325 paid. £150 considered as paid. Mortgages and charges, nil.

Neutron, Ltd.—R. S. Andrews, C.A., of 448, Strand, W.C.2, was appointed receiver (with other powers) on February 7th, 1927, under powers contained in second mortgage dated November 5th, 1926.

Accumulators of Woking, Ltd.—H. T. Witt, of 5, Chancery Lane, W.C., was appointed receiver on February 16th, 1927, under powers contained in debenture dated November 30th, 1920.

C. & J. Arrigoni & Co., Ltd.—H. F. Crowley, of 65-66, Chancery Lane, W.C.2, was appointed receiver on January 24th, 1927, under powers contained in debentures dated December 4th, 1925.

Liverpool Electric Cable Co., Ltd.—Capital, £50,000 in £1 shares. Return dated December 14th, 1926. All shares taken up. £7,833 paid. £42,167 considered as paid. Mortgages and charges, £1,372 3s. 7d.

City Notes.

The "Underground" Group.

The annual meetings of the four electric railway companies and the London General Omnibus Co., Ltd., forming this group, were held on February 24th, Lord Ashfield (chairman) presiding. In moving the adoption of the reports and accounts, which were dealt with at length in our last issue, the chairman said that having regard to the troubles of the year, the position could be considered satisfactory; the companies had come through without permanent impairment of their financial condition. The working of the Common Fund had permitted the repetition of the 1925 dividends; the railway companies, which had suffered, had benefited by the larger contribution of the omnibus company. Although the railways had been extended, they lost nearly nine million passengers. Had it not been for the industrial troubles, all the members of the group would have shown a record expansion. To indicate the effect of the general strike upon their traffic, Lord Ashfield mentioned that there were no fewer than 28,000 factories of all sizes in the Greater London area. Even after the resumption of work, the effects continued to be felt, and they spread to the residential areas, depleting the shopping crowds which the companies normally carried. As a consequence, the number of journeys per head of the population served had fallen from 503 to 494. The traffic on the extended City and South London Railway continued to grow rapidly, but the Edgware extension traffic had not advanced as quickly as was anticipated. They hoped for good results from the erection of houses at Burnt Oak and Morden by the London County Council. Inquiries by the London Traffic Advisory Committee had shown that further underground railways were wanted, and the companies would be gratified to undertake the work, with some of which they were in cordial agreement. Unfortunately, the capital costs would be enormous, and in their present condition the companies could never raise the amount of money required at reasonable rates. The Committee would have to wait until means had been devised of assuring the companies an adequate return upon the money which they had already spent. Many working economies had been effected, and the cost of operation per car-mile had thereby been reduced, but in the meantime further burdens in the way of taxation had been imposed, especially upon the motor-'bus undertaking. Income tax had proved a very onerous burden to the whole group; while the ordinary shareholders received £648,000, the Government received £751,000 out of the year's earnings. In conclusion, Lord Ashfield said he hoped that in future it would be realised that the stoppage of a public utility was not a legitimate means of furthering an industrial dispute.

The report and accounts were adopted.

London Tramway Companies' Reports.

Four of the London tramway companies published their reports for the year ended December 31st, 1926, last week, and these are summarised below. The annual meetings were to be held on March 2nd:—

South Metropolitan Electric Tramways and Lighting Co., Ltd.—The balance on working (net income) was £46,081, as compared with £48,248, and after deducting interest, rentals, and other fixed charges, a balance of £36,495 remains, plus £10,244 brought forward. From this £15,000 is again allocated to renewals, a dividend of 5 per cent. is to be paid on the ordinary shares (as for 1925), and a balance of £9,379 is carried forward.

Metropolitan Electric Tramways, Ltd.—There was a loss on working of £3,844, the traffic revenue being £628,569 and the expenses £632,413. Other income amounted to £127,047, which gave a net income of £123,203, as compared with £110,066 in the preceding year. After meeting interest, rentals, and other fixed charges, there was a deficiency of £28,788, as compared with £43,846 in 1925.

London United Tramways, Ltd.—The traffic receipts amounted to £390,894 and the expenditure to £363,698, leaving net receipts of £27,196, to which is added £7,006 representing other income, making £34,202. After meeting interest, rentals, &c., there is a deficiency of £20,070, as compared with £29,149 in 1925. A total deficiency of £65,575 is carried forward.

London and Suburban Traction Co., Ltd.—This company, which combines the foregoing companies and the Tramways (M.E.T.) Omnibus Co., reports total receipts from dividends, &c., of £52,583. Expenses amounted to £49,880, leaving a net revenue of £2,703. To this is added £17,066 brought forward, making £19,769, which has been carried forward. The previous year's net revenue was £4,362. The summarised figures of the four companies show that the number of passengers carried rose by 393,543 to 282,844,803, while the gross receipts at £2,134,636 were £3,643 higher; the net deficiency was £6,185.

North Metropolitan Electric Power Supply Co.

The net revenue for the past year was £293,195 (as against £315,292), and to this is added £6,676 brought forward, making £299,871. After providing for debenture interest and redemption and transferring £100,000 to reserve, there remains £154,706. As already reported, the final ordinary dividend is at the rate of 10 per cent. per annum, and £9,149 is carried forward. The capital expenditure during the year was £510,197, mainly in respect of plant, machinery, trunk and distributing mains, and new sub-stations. Approximately 145 miles of mains was laid and 39 new sub-stations were put into service. The energy sold rose from 112,000,000 to 118,900,000 kWh, and the number of consumers, supplied directly or indirectly, from 56,000 to 69,000. The financial results were adversely affected by the company's policy of not increasing charges to consumers on account of the coal dispute; indeed, in certain districts the rates were reduced. Supply was commenced during the year to Boreham Wood and Elstree, Cuffley, Great Amwell, Harmer Green, Stanstead and Wormley. The report makes reference to the registration of the North Metropolitan Power Station Co., Ltd., which has received a Government guarantee for £850,000 of 5 per cent. debenture stock, providing funds for the construction of the Brimsdown station. Since the last report 199,980 ordinary and 300,020 6 per cent. cumulative preference shares have been issued at a premium, and the total premium (£55,620) has been transferred to reserve. The holders of the 8 per cent. second preference stock have received notice that their holdings will be redeemed at par on July 1st, but they will be given an opportunity of exchanging the stock for new stock or shares. A Bill has been deposited in the present session of Parliament to increase the authorised capital by £1,500,000 and to extend the borrowing powers. The annual meeting was held on Tuesday last.

Lancashire United Transport and Power Co., Ltd.

The total receipts of the combined undertaking for 1926 were £283,177 and the gross profit £54,454. The loss of profit occasioned by strikes is estimated at £20,000. Motor-'bus and sundry receipts, including an amount received from the South Lancashire Tramways Co., amounted to £147,591. After deducting depreciation and interest, &c., on first mortgage stock, it is proposed to pay interest at 4 per cent. on the second mortgage stock and to carry the balance (£122) to depreciation account.

Sir Arthur Stanley, G.B.E., presided at the annual meeting on February 24th, and in moving the adoption of the report, said that the tramway traffic had been depleted by the general strike and the coal dispute, but the number of passengers carried by the omnibuses had increased. The profit on the sale of electricity (£11,381) was by far the highest yet obtained. The company had borne its troubles well, and a period of industrial tranquillity was now looked forward to. The prior lien debenture stock had been redeemed out of the proceeds of an issue of first mortgage debenture stock. The report and accounts were adopted.

Midland Counties Electric Supply Co., Ltd.

The trading profits of the undertakings owned and operated by this company for 1926 amounted to £186,189. From this the undertakings appropriated £21,625 for depreciation and reserves. Including £4,733 brought forward, the balance at credit and profit and loss account is £162,905. As announced last week, a dividend at the rate of 6 per cent. has been declared. £6,183 is transferred to debenture redemption account, and £10,000 to reserve, leaving £4,023 to be carried forward. The progress of the lighting and power undertakings continued, but at a lower rate, on account of the coal dispute. The traction properties were seriously affected, and did not show improvement. The company continued the extension of its network, and good results were obtained from the extensions. The amounts set aside for reserve and depreciation are lower on account of the loss of revenue due to the coal stoppage. During the year 250,000 preference and 250,000 ordinary shares were issued. The meeting was held on Tuesday last.

German Companies.

The directors of the *Siemens and Halske Company*, in their report for 1925-26, state that although the influx of orders was not greater than in the previous year, standardisation and improved methods of production gave larger profits. It was possible to lower prices in important branches. The orders received from abroad exceeded those booked in the previous year, notwithstanding the difficulties of high tariffs and other

protective measures. In the telephone cable branch, while orders from the Reich postal authorities had been few, large orders were received from Belgium on reparation account for the Vienna-Passau route, and also indirectly for that between Vienna and Budapest, and connecting links were also delivered for the connection of Switzerland and Holland to the German network. Large orders for automatic telephone plant were received from Italy, Japan, and Finland.

The report of the *Siemens-Schuckert Works* states that, despite the falling off of orders, the turnover was greater than in 1924-25. Greater attention was devoted to foreign business, although conditions were difficult. Large orders were received in connection with the Shannon hydro-electric scheme, and the company obtained important Russian orders. The works erected with the support of the company in Japan suffered from the economic difficulties in that country. An improvement occurred at the close of the year, orders being received from the iron and steel industries. Orders from the chemical industry had been satisfactory, and the business with the electricity supply concerns was about on the level of that in the previous year. The cable and overhead line branches were satisfactory. Large orders are expected in connection with the electrification of the Berlin city railway.

Belgian Company.

The *Union Electrotechnique* (*S.A.*), which absorbed an already existing firm in 1925, has issued its report covering the 14½ months to the end of 1926. The directors state that the results for this period were satisfactory, the net profits being 173,000 fr., permitting of the payment of interest on instalments and a "super-dividend" of 5 fr. per share. It is stated that the exports have increased by 253 per cent.

Ceará Tramway, Light and Power Co., Ltd.

The report for the year ended June 30th, 1926, shows a rise in the net receipts from 994,780 milreis to 1,043,915 milreis. The increased tariff which was put into force during the year was offset by wage increases, and the rise was due to the expansion of the lighting and power section of the business. A rise in the value of the milreis increased the sterling net results, but the exchange has since fallen. Although the results from the tramways are disappointing, there appears to be a steady improvement, and expenses should not increase. Out of the year's profits £12,026 has been put to reserve. If the results of the next few months warrant it, the directors propose to pay a dividend not exceeding 2½ per cent., free of tax, upon the issued capital.

Mersey Railway Co.

Speaking at the annual meeting on February 24th, the chairman (Mr. J. Falconer) said that in spite of the industrial disputes, the traffic had been maintained last year. After December 31st, 1925, the interest on certain classes of debenture stocks had become a fixed charge upon the revenues of the company, and since that date had been paid half-yearly. The company's report was summarised in our last issue (p. 312).

Quebec Power Co.

The *Financial Times* states that the report for 1926 shows gross income of $1,238,301, compared with $1,046,943 in 1925. Operating expenses were $271,034, compared with $236,644, leaving net operating income at $967,267, compared with $810,499. The report shows $7.84 per share earned on common stock, compared with $6.07 on less stock in 1925 and $4.37 on still less stock in 1924.

Stock Exchange Notices.

The undermentioned have been ordered to be officially quoted:—

County of London Electric Supply Co.—1,773,334 ordinary shares of £1 each, fully paid, Nos. 1,330,001 to 1,500,000 and 4,000,001 to 6,603,334.

South London Electric Supply Corporation.—234,000 ordinary shares of £1 each, fully paid, Nos. 310,001 to 544,000.

Launceston and District Electric Supply Co., Ltd.

A gross profit of £2,158 was reported at the annual meeting on February 18th. The vice-chairman (Mr. W. H. Symons) said that a number of new houses were being wired, including the last batch erected by the Council, and with the exception of eight or nine, all the business establishments in the town were consumers of electricity. A dividend of 6 per cent. was declared.

Montreal Light, Heat and Power Co.

The report for the past year records a gross revenue of $18,907,382 and a net income of $7,082,567. Dividends absorbed $5,135,041, insurance fund $58,644, and pension fund $20,000, leaving $1,869,482 to be transferred to capital and surplus. The report refers to a re-arrangement of the debenture capital during the year.

National Gas Engine Co., Ltd.

The profit for the past year was £27,467, and to this is added £15,894 brought forward, making £43,361. After meeting the preference dividend, it is proposed to pay a dividend of 2½ per cent. on the ordinary shares, leaving £16,360 to be carried forward.

Colombo Electric Tramways and Lighting Co., Ltd.

Negotiations have been reopened with the Ceylon Government for the sale of the company's power plant and distribution system. The company previously accepted an offer of £250,000, but cancelled the acceptance later on account of a variation of the terms.

Atlas Light and Power Co., Ltd.

The directors of this company (formerly the Argentine Light and Power Co., Ltd.) have declared an interim ordinary dividend of 2 per cent. No interim dividend was paid last year, but the full dividend was 4 per cent.

Direct West India Cable Co., Ltd.

A dividend at the rate of 3½ per cent. per annum, free of tax, has been declared on the ordinary shares for the past half year, as compared with a rate of 10 per cent. last year.

Halifax and Bermudas Cable Co., Ltd.

The ordinary shares are to receive a dividend at the rate of 10 per cent. per annum, free of tax, for the past half year, as in 1926.

Elgin Electric Supply Co., Ltd.

The profit for the past year was £1,447, as compared with £836 for 1925, and after paying a dividend of 5 per cent., £669 is carried forward.

Telegraph Construction and Maintenance Co., Ltd.

A final dividend of 7½ per cent., free of tax, is recommended, making 10 per cent., free of tax, for the year, as for 1925.

American Telephone and Telegraph Co.

A quarterly dividend of $2¼ per share has been declared on the common stock, as in 1926.

Pennsylvania Water and Power Co.

A quarterly dividend of 2 per cent. has been declared on the capital stock.

Canadian General Electric Co., Ltd.

A dividend of 1¾ per cent. has been declared on the preference stock for the quarter ending March 31st.

Stocks and Shares.

Monday Evening.

While the tendency of prices in the purely gilt-edged market remains dull—almost depressed—the disposition in other Stock Exchange departments is to put things better. A considerable volume of business is afoot. Slowly it becomes obvious that one effect of the war was to introduce Stock Exchange affairs to wide circles of the population which, previously, put their savings into the Post Office or equivalent old stockings. Every new issue that appears nowadays is accorded a closer inspection than it would ever before have received, and the war loans, so vigorously pushed by the Government, proved the means for popularising, to a remarkable degree, the wares of the Stock Exchanges.

The markets with which we deal here are amongst those that have benefited largely from this extension of public interest. The new investor displays a partiality for stocks and shares in companies that he can see at work. Taking the 'bus and tube group as an example, nobody—in London and its sprawling suburbs—can escape its penetrating presence. Electric lighting schemes, the country through, are of insistent and persistent interest. People like to "see their money in front of them," according to the fancy of a great many. The dominant wireless note struck in thousands of homes every night is a recurring reminder of Marconi, and although the past few years have been so unhappy for older purchasers of Marconi shares, the speculative fancy lightly turns towards them as holding promise for future prosperity.

And the "new investor" asks for prospects of capital appreciation, besides security of his money. We find, for instance, the holder of London electricity supply shares looking at these with the slightly dissatisfied air of one in whose investment the chance of improvement in value is but slender. He turns to the shares of the big provincial power supply companies, Midland Counties, Yorkshire, Newcastle-on-Tyne, Lancashire, and the Scottish undertakings. In the good concerns of this class, there is obvious scope for extension. Dividends are of the 6 per cent. to 8 per cent. order; prices stand relatively high, and yields are not liberal. But the investor of to-day foresees the likelihood of more capital being required; therefore, more issues of shares at bonus prices, more chance of profits in this direction than in bumper dividends. The policy of following this line of argument is reasonable: the main uncertainty, mentioned for what it may be worth, is the Government's possible action in the popularisation of electricity. To the ordinary man, the wisdom of using the existing stations, where suitable, would seem too plain for the admission of a doubt.

The County of London final dividend of 5 per cent., on old

and new shares alike (Electrical Review, p. 313), provoked a shade of disappointment in the market, where 6 per cent.—to make 11 per cent. for 1926—had been expected. The price reacted to 26s. 9d. and rallied to 27s. 6d., leaving a loss of 6d. on the week. Metropolitans drooped to the same extent, while Westminsters hardened to 25s. 6d. Midland Counties are 6d. up at 21s. 6d. Yorkshires and South Metropolitan preference regained the dividend deductions made from their prices last week.

The North Metropolitan Electric Power Supply Company seeks Parliamentary sanction to raise its capital by £1,500,000 to £3,500,000, with a corresponding increase in its borrowing powers. The Bill will pass unopposed through the House of Lords. The Company lately offered £850,000 5 per cent. debenture stock, under the Trade Facilities Acts, at 100½, the price of which stands at ⅛ discount; fully-paid scrip is quoted 100¼. In its report, issued the other day, the North Metropolitan shows an increase in the number of its customers, of 23 per cent., whose consumption of energy was 6 per cent. greater than that in the 1925 period. The Company's 6 per cent. first preference are quoted 22s., the 8 per cent. second preference stock at 100, and the 5½ per cent. debenture stock at about the same price. London Power 5 per cent. debenture can be bought at 98½, free of stamp and fee, with three months' interest due on April 1st. The yield is £5 1s. 3d. per cent. on the money, and the security stands in the front rank. County of London 7 per cent. debenture is on offer at 107, April and October interest. The stock can be repaid by the Company at 100 any time after 1931, and holders will do well to bear in mind the strong probability of redemption being effected at 100, in a few years' time. Also, there is a sinking fund, now in operation, for repayment at 100.

Piedmont Hydro Electric Company shares were thought to be on the point of introduction to the market, and their advent aroused attention. Advance details showed the Company to have an authorised and issued share capital of 600 million lire, divided into 4,800,000 shares of 125 lire each. The undertaking is stated to comprise over 40 hydro-electric power companies and telephone companies, the latter operating about 50 per cent. of the telephone services of Italy, under agreement with the Italian Government. For the three years 1922-1924 inclusive, annual dividends of 8 per cent. were paid. In 1925 the dividend was 9 per cent., and in 1926 9.60 per cent. Caution will recognise the speculative element that must attach to any industrial company working in Italy. Some hitch is said to have occurred in the negotiations, and the issue may be postponed for a time.

Mexican Utility issues remain in request, and a rise of 5 points brought the Light and Power preferred shares to 97½. The Company is expected to deal with the arrears of dividend on these shares, accumulated since October, 1913, by the allotment of a new stock carrying 4 per cent. interest. Nothing definite is known on the point, but an official statement is looked for in March. Other Mexicans are firming up. Anglo-Argentine Tramways preferences have improved, and Brazilian Tractions went ahead with a rise of 3½ points. On the other hand, British Columbia issues further reacted, the deferred and preferred being 3 and 2 down respectively. There is no fresh movement in the London tramways' prices. The reports of the companies are out, and the Metropolitan Electric Tramways have declined to renew their lease in 1930 unless the competition from omnibuses is restricted.

Lord Ashfield has promised to deal with the question of unifying London transport when he addresses the Underground Electric Railways of London meeting on March 15th. His speech is awaited with keen curiosity and interest. He foreshadowed a substantial raising of new money for the London General Omnibus Company. Last year, said Lord Ashfield, was a good one, but this year should be a better. Districts, Central Londons, Metropolitans, are all higher. The Underground £1 shares have advanced to 15s. 6d., at which the current yield on the money is £1 18s. 9d. per cent. The Southern Railway, according to a statement made in the House of Commons last week, is so satisfied with the electrification of the Company's London suburban lines, that it is anxious to proceed with further extensions.

United River Plate Telephone shares are 10s. up at 8⅞, the demand being pressing. Automatic Telephones lost a trifle at 53s. 6d., and International deferred sagged to 40s. 6d. The shrinkage in the price of the latter is arousing some little uneasiness in the minds of people who bought at several shillings above the present price, when speculation was active in the shares. It is now thought that the dividend will be 10 per cent., or possibly rather more. Cable stocks and shares have not changed in price for a week.

Johnson & Phillips gave way abruptly to 55s. 6d.; a subsequent rally to 56s. 3d. has left the price 2s. 6d. down on balance. Small losses occurred in British Insulated, English Electric, and General Electric. Henleys are easier at 89s. 3d., but the preference at 4½ have regained the dividend taken off the price a week ago. Iron, steel, and engineering shares display a harder disposition. The rubber share market is bracing up; the raw produce looks firmer, and there is not much floating supply of shares to satisfy the mild inquiry of the past few days. Speculation does not exercise a great deal of discrimination nowadays if it sees a possible chance of a rise, but a general advance in rubber shares at the present time might easily prove to be premature. In wireless shares, Marconis are 1/16th up at 16s. 3d., and Canadians at 3s. 10½d. have gained a few halfpennies.

The British Industries Fair.—III.

Functions and Exhibits at London and Birmingham.

THE heavy section of the British Industries Fair at Castle Bromwich, Birmingham, opened under the most auspicious circumstances, and on a note of optimism. The attendance of buyers from overseas, and also from this country, has been in excess of former years from the first week of the Fair, and the authorities issued an official statement on Saturday last to the effect that the buyers up to the previous night had numbered approximately 31,000. In very many instances buyers spent two and three days at the Fair. It was also officially estimated that the value of the business actually done during the first five days of the Fair was one and a half million pounds, whilst the number of business inquiries from all parts of the world, and particularly from the Dominions, was substantially in excess of those in previous years. It was pointed out that a good deal of business was re-opened with small far-away countries, from which, in a commercial sense, very little has been heard for several years. Another point of interest is that Australia, and some parts of South America, are buying on bulk lines, and this tendency is also a little more noticeable with regard to India, although it is still to a large extent what the export merchants describe as a "cheap market." On Saturday, there was a huge attendance of employés from all parts of the Midlands. The six miles of avenues were crowded in the afternoon, when over 30,000 persons were in the exhibition at one time.

Metropolitan-Vickers Electrical Co., Ltd.

Four Electrical Stands at Birmingham.

The number of official delegations of trade and professional organisations has been larger than on any previous occasion, and every day last week from six to ten societies were entertained by the Council of the Fair at luncheon, and during the current week a similar programme will be gone through. There is no doubt that the visit of the Prince of Wales on Tuesday last week gave a very great impetus to the Fair, and the presence on the same day of Lord Mayors, Lord Provosts and Mayors of industrial towns also had a good influence in a similar way. The Lord Mayor of London, with the

Sheriffs of London, intimated their intention to pay a visit in civic state to the Fair on Wednesday this week. Wednesday last week was exporters' day, and other delegations then present were the members of the Consular Association of Birmingham, the Metal Thread Screw Manufacturers' Association, and the National Hardware Association. Mr. Stanley Baldwin, the Premier, had a most enthusiastic reception on Thursday last, and in company with Mr. L. S. Amery, Colonial Secretary, and the leading officials of the Department of Overseas Trade, made an extensive tour of the Fair. The Prime Minister described the heavy section of the Fair as an unqualified success, and declared that there could be no more convenient place for such a movement than Birmingham, which was in the heart of the country, and accessible from all parts.

On Thursday, the visitors included the Ironmongers' Federated Association, the British Commercial Gas Salesmen, and the British Society of Gas Undertakings. Having regard to the fact that the electrical industries' display is by far the biggest ever seen in the provinces, it is not surprising that there should have been a record attendance of electrical men. From Fr day to Monday, no fewer than 16 electrical delegation attended, and others were expected yesterday (Thur day). These bodies included, of course, the Institutio of Electrical Engineers, the Wholesalers' and Co tractors' Associations, tramway engineers, and civ engineers. Substantial business for shipment has bee done by the electrical manufacturers, particularly i the direction of power plant for Australia, New Zea land, India, and South Africa.

We reproduce on p. 359 photographs of the stand of four leading electrical companies, and below w give brief reports of the proceedings at some of th luncheons held at Birmingham.

The London Section at the White City also repor good business. An official report recorded an averag daily attendance last week of 1,200, with the exceptio of Saturday, when there was an influx of over 18,00 more than half being members of the public. Foreig buyer-visitors last week numbered about 1,500; Ge many, the United States and Holland were very we represented, and the Dominions also sent many buyer

THE BIRMINGHAM SECTION.

As mentioned previously, the principal guest at a luncheon given at Castle Bromwich on Thursday last week was the Prime Minister, who was accompanied by Mr. L. S. Amery, Colonial Secretary, Mr. A. M. Samuel, Parliamentary Secretary to the Department of Overseas Trade, and Sir Wm Clarke, Comptroller of the Department.

The toast of "His Majesty's Government" was submitted, in a brief speech, by Mr. Gilbert Vyle, president of the Association of British Chambers of Commerce, who said that he thought that the Premier would be convinced as a result of his tour of the Fair that British manufacturers were progressive and endeavoured to adapt themselves to present-day needs of British and foreign consumers.

Replying to the toast, the Prime Minister pronounced the Fair to be an unqualified success. He paid a tribute to the courage and foresight of British business men, and touched on the evidence which the Fair afforded of a new co-operative spirit in industry, marking a departure from the old English habit of secrecy and reserve. The other thing which interested him was the amount of space devoted to lighting and heating. The solution of the coal problem would undoubtedly come when the electrical people, the gas people, and the makers of stoves and modern fireplaces could bring into every cottage in the country, or every cottage within reach of gas or electricity, the means of cheap and clean heating which would eliminate the need for that most expensive method of distribution, the selling of small quantities of material like coal.

The delegations on Friday last were from the Association of Mining Electrical Engineers, the Incorporated Association of Electric Power Companies, the Institution of Electrical Engineers, the Municipal Tramway and Transport Association, and the Tramways and Light Railways Association. At the luncheon, Mr. R. A. Chattock, city electrical engineer, Birmingham, presided, and among those present were Mr. Roger T. Smith, Dr. A. H. Railing, Col. W. T. Kent, Messrs. H. H. Berry, D. Martin, Theodore Stretton, G. M. Harvey, F. Austen, C. Spencer, R. P. Sloan, J. T. H. Legge, W. J. Binnie, and A. H. Dykes, Ald. J. Bowes, Ald. Sir John Timson, and Mr. R. L. Horsfield.

The Chairman, apologising for the absence of Dr. Ferranti, who was indisposed, expressed the hope that the visit of the various representatives of the electrical industry would be profitable to them and would demonstrate that there was no intention that the old country should be left in the cold in the future.

Dr. A. H. Railing, proposing the toast of "The Visitors," said to him the Fair was full of indication that the industrialists of the country possessed common sense and intuition. Many of them had been to the exhibitions of Paris, Brussels, Dusseldorf, Leipzig, and Lyons, and had seen more spectacular displays, but what struck him as an engineer and manufacturer most forcibly in the Fair was that there was very little commonplace in it, that each piece of apparatus represented a deliberate pressing forward in speciality work, and not done haphazardly any more like of old. They wanted to see that those who had the direction of supply companies, manufacturing companies, and mines did not provide just for tomorrow, but for a long period ahead. They wanted supply companies and consulting engineers to realise that they must waive their personal opinions on minor matters to enable the manufacturers to get out of the manufacture of specialities in order to enable them to manufacture standardised articles on quantity production lines. The mine-owners must realise that they had to raise money for modern electrical equipment or else go under. Electrical manufacturers must go in for research so as to be pioneers, not imitators, and the big supply companies must assist those concerns who undertoo pioneer work. He thought that it was necessary for t horse-power per man in this country's factories and min and means of transport to be trebled or quadrupled to comparative with some other countries, and that was the on way largely to increase our output per man, and raise h wages, and thereby raise our export possibilities and increa our inland market.

The toast was responded to by Mr. Roger T. Smith, pa president of the Institution of Electrical Engineers.

Mr. T. R. Martin (J. H. Tucker & Co., Ltd.), Chairman the Management Committee of the Fair, and of the Adviso Committee of the electrical section, presided at a luncheon Saturday last, when representatives of the Electrical Pow Engineers' Association, the Meter Engineers' Technical Ass ciation, the National Association of Supervising Electrician the Birmingham and District Association of the Institution Civil Engineers, and the Institution of Electrical Engine (Students' Section) were present.

The Lord Mayor of Birmingham, with whom was t ex-Lord Mayor (Sir Percival Bower) extended a hearty cir welcome to the visitors. The electrical industry, he said, h set up a remarkably high standard, and it was warmly to commended for its enterprise.

The toast of the "Visitors" was proposed by Mr. R. Chattock, who warmly welcomed the numerous body of jun electrical engineers. During the past eight years, the peri in which that fair had been held, enormous progress h been made in electrical engineering, and much of the new equipment was to be found on the stands. The main adva tage of the Fair was that it enabled those in the industry compare one set of apparatus with another, which could n be done in any other way so satisfactorily.

The toast was replied to by Mr. A. W. Crompton (E.P.E.A and Mr. G. F. Shotter (M.E.T.A.).

Mr. T. R. Martin presided at another luncheon on Mond February 28th, at which the following bodies were rep sented:—The Council of the Birmingham Chamber of Co merce; the Electrical Contractors' Association; the Electri Contractors' Association of Scotland; the Electrical Who salers' Federation; the Illuminating Engineering Society; a the National Register of Electrical Installation Contractors

The toast of "The Visitors" was proposed by Mr. H. Berry, a member of the Fair Management Committee. referred with satisfaction to the growth of the electri section, which was instituted last year, and said that they, manufacturers, desired the co-operation of all the trade orga sations to help in the increasing prosperity of the Fair, its effect upon the British electrical industry, especially relation to foreign markets, was obvious. They would l the Fair to be looked forward to annually as a great tr effort. Apart from Press publicity, there were two ways bringing merchandise under the notice of buyers. One v by sending out commercial travellers, and the other by su exhibitions as the Fair. Mr. H. J. Miles (president of Electrical Contractors' Association) said that the Fair wa business-like display of British products; and Mr. Mackintosh (president of the Scottish Electrical Contracto Association) observed that while the Electricity Bill did mark the millennium, it would be to the benefit of the dustry. He said that he did not think adequate attention v paid to salesmanship; it was the predominant factor in th business. Mr. G. P. Dennis (president of the Electri Wholesalers' Federation) expressed the opinion that the el trical industry was not fully represented, and ur B.E.A.M.A. to make itself responsible for the electrical sect of the Fair in future years to ensure adequate representati

British Electric Transformer Co., Ltd.

This company's exhibit consists of three separate transformers in various parts of the buildings. One, a 1,000-kVA, 10,500/3,000-V, 3-phase, oil-cooled, core-type transformer (fig. 11), is displayed in the engine house. A 100-kVA, 3-phase, oil-cooled, core-type transformer, with switchgear, is to be seen in actual use supplying power for the exhibition, the power being derived from the Birmingham Corporation's mains. The other, a 33⅓-kVA, single-phase, radial-type, air-cooled transformer, is installed in a kiosk built by the Yorkshire Switchgear and Engineering Co., Ltd. The core-type transformers are of the "Berry" standard pattern, with cores interleaved and split to provide a cooling duct. The framework is of a patented box girder construction which is lighter and stronger than the usual channel steel section. The windings are concentric, mounted on bakelite cylinders, vacuum dried and impregnated. The ends are securely fixed by bakelite end blocks, the h.p. windings being provided with adjustable compression screws. Ample attention has been paid to the cooling of the h.p. windings by means of

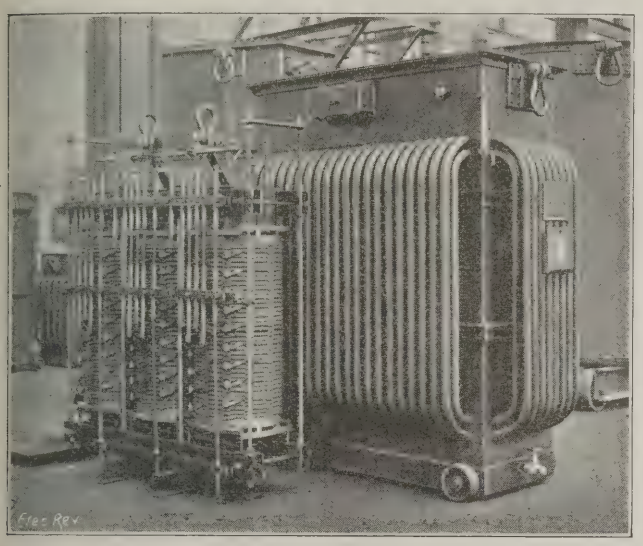

Fig. 11.—A 1,000-kVA, 10,500/3,000-V. Transformer.

vertical ducts through both h.p. and l.p. windings, with the addition of horizontal ducts in the h.p. windings only. The tanks are of the usual boiler-plate construction, with external cooling tubes for the oil. The 100-kVA, three-phase transformer, which is supplying power to the exhibition, is equipped with a special combination of h.p. switch- and fuse-gear made, so far as is possible, "foolproof" against improper use. The apparatus is entirely ironclad, and consists of a three-phase oil-break switch connected in series with three liquid-filled "Empire" fuses. The interlocks on the apparatus ensure that the following cycle of operations is observed, preparatory to the replacement of the fuses should they blow, or should circumstances necessitate the transformer being examined. The oil switch is opened, thus breaking the h.p. circuit; the entire oil switch is then lowered, and insulating barriers are interposed covering all the "live" ends of the cable. The same operation permits of the door of the fuse cubicle being opened, and access gained to the fuses, which are now entirely "dead." Similar operations carried out in the reverse order provide for putting the transformer back on to the supply. The small 33⅓-kVA air-cooled unit is of the original "Berry" radial pattern. It is specially designed for lighting purposes, having a very low open circuit loss with correspondingly good efficiencies at the lower loads. The actual figures are 98.1 and 98.25 per cent. at full and half loads respectively. The primary winding is sandwiched between the two halves of the secondary, giving an impedance value of about 3 per cent., and the secondary is wound in layers direct on under heavy tension. The primary consists of a number of separate coils former wound and assembled on the job. The main insulation used between windings and also iron consists of best-quality micanite gradually formed in position. Insulation between layers consists of linen fabric impregnated in vacuum with special "Berrite" insulating compound.

London Electric Wire Co. & Smiths, Ltd.

Upon this stand is a display of "Lewcos" products, which include silk, cotton, asbestos, covered and enamelled wire and strip of all sizes, as well as various types of wire for specific purposes. Insulating materials and wireless products are also displayed. The last section includes aerial and Litzendraht wire, screened coils, multi-way battery leads, &c.

K.F.M. Engineering Co., Ltd.

This company is a manufacturer of electric and other signs, and a number of these are exhibited on its stand. Some of these are distinctly original in construction and appearance.

Rees Roturbo Manufacturing Co., Ltd.

This company is showing running models of four Rees Roturbo pumps. The first is a boiler-feed pump, driven by a turbine. On this model the pump is carried from the turbine pedestal bearing, thus eliminating the baseplate and making a very compact arrangement. This is a comparatively new model, and although it has not long been on the market, we understand that there has been a good demand for it. The next exhibit is a pump of the "UCV" type, coupled to a Rees-Roturbo motor. This is of the medium lift type, and the casing is split on the centre line, allowing the whole of the internal parts to be readily examined or removed without disturbing the pipe connection. A multi-stage pump coupled to a Rees-Roturbo d.c. motor is shown, and an interesting exhibit is a self-contained pumping set of the "UH" type. This has been designed to meet the demand for a simple and cheap type of pump of moderate capacity. It is very compact, occupying minimum ground space, and very simple in design and construction. It embodies the Rees-Roturbo self-regulating properties with consequent immunity from overload of the driving motor through variation in head and volume when running at constant speed.

Stewarts & Lloyds, Ltd.

The exhibits on this stand comprise wrought iron and steel tubes for the conveyance of gas, water, steam, compressed air, &c., with all the necessary fittings. These tubes, ranging from ⅛ in. to 60 in. bore, are manufactured by the lapwelded, buttwelded, or solid drawn processes, according to size and quality. Of particular interest is the "Victaulic" joint, which is a cheap and efficient means of jointing tubes. The special feature of the joint is a flexible rubber ring on the principle of the "U" washer used by hydraulic engineers.

A. Reyrolle & Co., Ltd.

Substantial design is the keynote of this company's display. The switchgear section includes examples of air-break switches suitable for factories, foundries, ship yards, &c. Double- and triple-pole patterns are shown for currents of 30 and 60 A, and one notable item is a 60-A, triple-pole switch, combined with a 30-A plug and socket. The principal oil-break switch on view is a 60-A gate-end switch with boiler-plate tank (fig. 12). This is fitted with a mechanically-interlocked 60-A, 3-phase and earth pin plug and socket. It is claimed to have received the first "flameproofness" certificate from Sheffield University. A selection of cable boxes is exhibited. Among these are 6,000-V and 660-V, 3-phase dividing boxes with glands and armour clamps; 4-core and 20-core pilot dividing

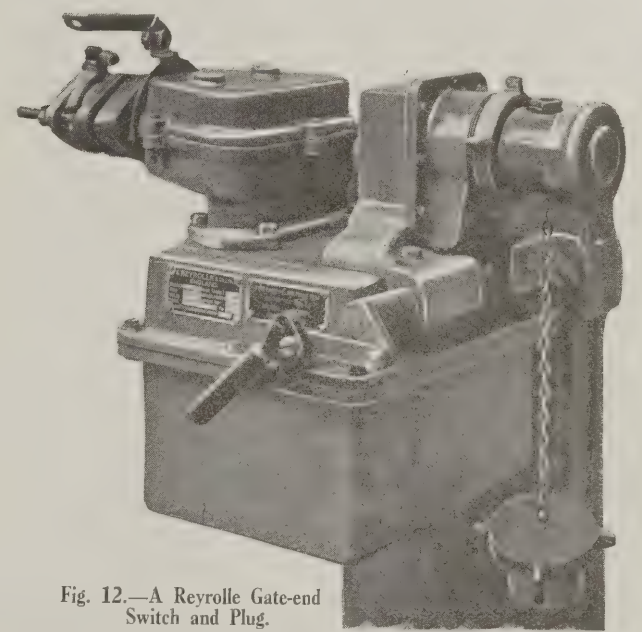

Fig. 12.—A Reyrolle Gate-end Switch and Plug.

boxes; an up-to-date telephone dividing box; and examples of sealing bells for general purposes. A combination of gear is a 100-A, double-circuit combined switch and fuse panel, a 60-A similar panel, and a 30-A single-circuit fusebox. The board forms one complete floor mounting distribution board, with incoming dividing box and cone gland on the left, extension end plate on the right, and outgoing circuit dividing boxes with universal glands and clamps. It may also be supplied for wall mounting and for use on any combination of circuits up to 500 A. A selection of ironclad distribution boxes is shown. Among these are a 60-A, two-way triple-pole weatherproof fusebox, complete with one incoming and two outgoing dividing boxes, each with universal gland, and a 30-A, four-way, single-pole dustproof fusebox. A demonstration board on the stand bears a number of domestic and industrial plugs and sockets. The industrial plugs shown include a 100-A flameproof combination, a 60-A, 3-phase, weatherproof pattern, vehicle-charging plugs, &c. Another demonstration board displays the company's standard self-aligning porcelain-handled fuses.

Blackstone & Co., Ltd.

Five models of the Blackstone "Spring Injection" cold-starting oil engine are the principal exhibits on this stand, other exhibits being the "Spring Injection" mechanism, the Blackstone combined petrol engine and compressor, a fuel oil filter tank, and Blackstone petrol engines of 4 and 5 b.h.p. The advantages claimed for the "Spring Injection" engine are that it will start from cold on any grade of fuel oil which can be pumped; the fuel is injected mechanically into the combustion chambers at the same point at the end of each compression stroke by a simple device, ignition taking place through the heat of compression in the cylinder; a more prolonged combustion can be obtained, with the result that the engine is not subjected to unnecessarily severe stresses, and the efficiency, both mechanical and thermal, is greatly improved. The fuel consumption per b.h.p.-hour is guaranteed in the single-cylinder sizes, developing 50 b.h.p. upwards, to be only .4 lb. for full and three-quarter load.

Belliss & Morcom, Ltd.

The principal exhibit on this stand is a 750-kW high-pressure steam turbine. This is coupled to a 750-kW alternator by the Lancashire Dynamo & Motor Co., Ltd. It has a speed of 3,000 r.p.m., is adapted for about 180 lb. steam pressure, and any temperature up to 450 deg. F. and 28½ in. vacuum. The diaphragms are rolled steel, fitted with standard brass blades throughout. For high temperatures the casing would be of steel and the high-pressure blades of Monel or stainless steel depending on the conditions. Both wheel and diaphragm constructions are illustrated by separate exhibits. The turbine has the standard governor gear for turbines of the size, the governor box at the end containing the oil relay mechanism. Another important exhibit is a Belliss "V" type enclosed compound high-speed engine, with forced lubrication. This is designed to develop 290 b.h.p. at a speed of 425 r.p.m., and will withstand a 25 per cent. overload. The slide valves are arranged between the steam cylinders, the centre lines radiating from the shaft centre in V form. The valve chests being so disposed, the necessity for outside receiver pipes is avoided. All bearings, including the joints of the governor, are lubricated with oil under pressure. The front doors are removed to show the working parts and the forced lubrication system, the engine being rotated at a speed of 25 revolutions per minute by means of a 3-b.h.p. motor supplied by the Crypto Electrical Co., operating through a Wallwork worm gear and a Hans Renold chain drive.

The 750-kW alternator made by the Lancashire Dynamo and Motor Co., Ltd., used with the steam turbine, is of the "Lancashire" turbo type with direct-coupled exciter. It has an output of 937 kVA at 5,000/5,500 V, with a power factor of 0.8. It is arranged for closed air circuit cooling, and with thermo-electric detector for recording the temperature at the switchboard. A separate exhibit is the "Arca" regulator, manufactured by British Arca Regulators, Ltd.

Kelvin, Bottomley & Baird, Ltd.

The principal exhibit on this stand is the "K.B.B." quartz mercury-vapour lamp, designed for scientific, medical and commercial application. The feature of this lamp is that the quartz envelope is not exhausted, the arc working at atmospheric pressure. Another feature is the slow rate of decrease of the ultra-violet output with usage, and the richness of the rays. The "K.B.B." "Pneumercator" distant boiler-water gauge, which is exhibited, can be placed in the best position for observation below, above, or at any reasonable distance from the steam drum, and as it is charged with cold water when in operation, the life of the gauge glass is considerably prolonged. It enables the water gauge to take its place amongst other boiler control instruments at a level which admits of constant and convenient observation. The "K.B.B." "Econometer" CO_2 tester is an instrument for analysing flue gases for CO_2. Of robust construction, it is charged with dry absorbents and gives high accuracy without the use of laboratory glassware, glass cocks, &c. There are no delicate parts, and no skilled adjustment is necessary. An interesting exhibit is the "Macbeth" artificial daylight lamp. The transmission filters used in this lamp are spectrographically tested, and their efficiency as a substitute for daylight has been certified by the N.P.L. Other exhibits on the stand include the "Pneumercator" tank-gauge, which provides a means for indicating at a distance the height, weight of volume of liquids in tanks; the "K.B.B." smoke warning and fume indicator, a simple device that renders the condition of the uptake gases visible at all times; the "K.B.B." vibrometer, providing a ready means for the detection and investigation of vibration; the "K.B.B." thermo-electric pyrometer; and samples of transparent fused quartz.

Hunt & Mitton, Ltd.

This firm is showing a representative selection of its steam fittings, boiler mountings, lubricators, &c., and also steel valves in all sizes from 1¼ in. downwards. The principal feature is a 12-in. "Supertite" cast-steel parallel slide valve, of massive pattern, for working pressures up to 450 lb. per sq. in. This is fitted with the Dean system of electric control for easy opening and closing. Developments in small stamped steel valves are shown, as well as samples of "Nickloy," a metal compound for valve faces under superheated steam.

National Gas Engine Co., Ltd.

This company displays examples of its "CS" type, 31-b.h.p., horizontal oil engine, a "CX" type, 66-h.p., horizontal oil engine, a "5V" town's-gas engine, a "National-Wallwin," non-chokeable pump, and a "10V" town's-gas engine and dynamo. The type "CS" is of massive construction, and designed to operation with a low consumption of fuel and lubricating oil; the special fuel pump and atomiser secure effective consumption at all loads. The atomiser passes through the water jacket to the combustion chamber, the entire surface of which is water cooled. Oil tanks and sprayers are provided for the use of light and heavy oils, the heavy-oil tank being arranged in conjunction with a strainer and heater attached to the exhaust pipe of the engine. The "National" "5V" and "10V" gas engines are fitted with a centrifugal governor of the latest type, which reduces friction to a minimum and controls the engine in an efficient manner. An arrangement is fitted so that slight speed adjustments may be made while the engine is running. A special mixing valve, entirely automatic in operation, gives the correct mixture of air and gas at all loads.

Record Electrical Co., Ltd.

This company exhibits a complete range of switchboard and portable measuring instruments, also automatic battery cut-in and cut-out switches for accumulators, automatic circuit breakers for power circuits, and electrical tachometers. There is a range of moving iron and moving coil "Cirscale" instruments, suitable for a.c. and d.c., respectively. These are provided with circular scales and a pointer which deflects through an arc of approximately 300 deg. This deflection is obtained entirely without gearing. For the mains engineer and electrical inspector, the new change coil test set for a.c. or d.c. will have a special interest. This set covers a very wide range from 0/1 amp., up to 600 amps., 0/6 volts up to 750 volts. There are no weighty accessories, such as shunts or transformers, which is an advantage. Among the newest developments is shown a range of skeleton instruments fitted in glass cases with transparent scales, so that readings may be observed from either side. These are for demonstration purposes in technical schools and colleges.

Vickers-Petters, Ltd.

This company, which has just changed its name to Petters (Ipswich), Ltd., is showing two types of heavy-oil engine, a "Petter-Light" set, and three other engines. Four of the exhibits are shown under working conditions. The Petter "C" type heavy-oil engine is a development of the hot-bulb semi-Diesel type, and has been developed to meet the need for an engine to give Diesel-like economy in fuel and lubricating oil combined with simplicity. It has a medium compression, and the cylinder head and combustion chamber are completely water-cooled. Ignition is effected solely by the heat of compression, no "hot-bulb" or other device being used.

Falkirk Iron Co., Ltd.

The principal exhibit of this company is, as last year, the "Falco" electric iron, several types of which are displayed. In addition, it is showing three models of the "Falco Livecoal" electric fire. These fires are designed to give an appearance of a live coal fire, the effect being helped by the manner in which the fire itself is raised from the floor in the old English style. One of the fires is a "period" rustless steel dog grate, the other two being of smaller, less expensive, sizes.

Harcourts, Ltd.

The principal exhibit on this stand is a process for depositing unstainable chromium on metal articles, called "Perchromia." This leaves the deposit glass-hard, and enables it to withstand attack from all household acids and salts. It does not tarnish in foggy or sulphurous atmospheres.

Ruston & Hornsby, Ltd.

The feature of this exhibit is a running model of the Ruston cold-starting horizontal oil engine, of the "Mark 13H," 130-b.h.p. type. This engine is made in sizes varying from 16 to 340 b.h.p., and the special claims made for it are low fuel consumption, low maintenance costs, continuous operation over long periods, ease of handling, and the ability to start from cold under any conditions. Another running exhibit is a Ruston two-stage air compressor, as used for charging self-starter air receivers, and the stationary exhibits include a 3-cylinder vertical oil engine of 57 b.h.p. and a Ruston patent "Thermax" boiler.

Batteries, Ltd.

The exhibit of this company consists of "Nife" batteries of the nickel-iron-alkaline type, which are specially suited to both light and heavy industrial purposes, as well as wireless and domestic uses. The principal point claimed in this type of battery is that it contains no lead or acid, but uses instead steel plates in a steel-preserving alkaline solution. On account of these elements the "Nife" battery has a number of advantages. There can be no sulphation or corrosion, no self-discharge or acid fumes, the battery can remain idle for an indefinite period, and it has a very long life and a high reliability factor.

Ward & Goldstone, Ltd.

The main feature of this exhibit is a comprehensive range of insulated wires, cables and flexibles for the electrical and automobile industries, and the ordinary range of commercial wires used for heating, power, and so on. The range of insulated flexible wires and cables for general electrical purposes covers every requirement, both in the quality of insulation and the style of finish, and embraces such specialities as "Negrolac," "Feroflex" and anti-shock flexibles. "Negrolac," a glossy black varnished cable, has been introduced especially to meet a demand for a cable of great flexibility, oil- and waterproof, and capable of withstanding extreme climatic conditions. A representative range of bell wires, telephone wires, and multi-telephone cables is included in the exhibit, as also are instrument wires with cotton, silk and enamel coverings. A range of some interest is the "Astra" and "Litz" special multi-stranded wire for plug-in inductance coils and transformers. In addition, there are being shown one or two models of high-tension battery eliminators for a.c. and d.c. circuits, and samples of battery-charging devices.

With the installation of a set of hydraulic presses at their factory, Messrs. Ward & Goldstone are now in a position to furnish large and small mouldings, and they are exhibiting a full range of these. A feature of the mouldings is that various colours with heat-resisting properties can be supplied.

Telegraph Construction and Maintenance Co., Ltd.

The exhibits on this stand, which are mainly the products of the Gutta-Percha Company, comprise two distinct sections. The first consists of special magnetic alloys. These have been named "Mumetal" and "Rhometal." "Mumetal" is characterised by its high magnetic permeability in very weak fields. It is in the form of fine wire, and has been successfully used for the inductive loading of high-speed submarine telegraph cables. In this respect it is interesting to note that section of the Pacific cable from Bamfield to Fanning Island, the longest single length of submarine telegraph cable in the world, was loaded with "Mumetal" wire, as the result of which the new cable can transmit signals at six times the rate of the old cable. In addition to this type of application, "Mumetal" has been used with success in current transformers. For certain requirements, however, the permeability of "Mumetal" is too high, and to meet these requirements "Rhometal" was produced. This alloy is characterised by its high electrical resistance, which is of the order of 100 microhms per cm. cube. Its permeability in fields tending to zero is of the order of 1,000. The second section consists of an electrical resistance alloy named "Pyromic," which contains no carbon, manganese, silicon or aluminium. It is a ternary alloy prepared in h.p. electric furnaces, and is manufactured in the form of wire, ribbon and tape. Also exhibited on the stand are three electric radiators, made by the British Electric Transformer Co., Ltd. These are wound with "Pyromic" resistance wire and tape.

Fielding & Platt, Ltd.

This company exhibits examples of its latest type semi-Diesel oil engine. These have been designed for use with fuel suitable for Diesel engines, but with less capital outlay, and they are specially suitable for dynamo driving, being quickly started and giving steady running, the cyclical variation being within very fine limits. The engine works on the four-stroke cycle of operation, and the oil injector is fitted with a cut-off valve which is controlled by the governor, so that the oil is cut off earlier or later in the stroke, according to the load on the engine. The combustion chamber is of patent design, and its action, in conjunction with the method of spraying the oil into it, ensures complete combustion.

Mouldensite, Ltd.

This company, which is associated with the Damard Lacquer Co., Ltd., Redmanol, Ltd., and the Bakelite Corporation of Great Britain, Ltd., is exhibiting samples of phenolic condensation products. These include moulding powders of various grades and colours, together with mouldings made from these, synthetic resins, varnishes, cements, and also laminated material in black and brown for electrical and radio work, punching, gears, &c.

Coventry Electrical Accessories, Ltd.

This company is showing its "Patent Point" electric iron, the particular feature of which is the special material inserted in the nose of the iron, enabling it to be used for at least half-an-hour after the current has been switched on for five minutes or so. The following appliances are also displayed: The "Ceal" electric iron, the "Wonder" iron, a grill toaster, an electric kettle, and a bowl fire.

British Vacuum Cleaner and Engineering Co., Ltd.

One of the most interesting of the exhibits on this stand is the "BVC." electric vacuum cleaner, which is the company's latest production. It is made in four sizes and is guaranteed against flaws or mechanical or workmanship defects for 12 months. Other exhibits are non-electric vacuum cleaners, in which line the company has specialised for many years.

The Steam Power Section.

An innovation in this year's Fair is a section devoted wholly to steam power plant and equipment. There are five large stands, three of which are equipped with boiler plant, while the other two show generating plant and auxiliaries. We have already dealt separately with a number of the components of this exhibit under the name of the responsible companies, but the following is a brief description of the arrangements. One stand bears a complete pulverised fuel installation (not working) consisting of an "Atritor" pulverising unit (Alfred Herbert & Co., Ltd.) fed by an Avery 2-cwt. automatic coal scale. The pulveriser is capable of dealing with 500 lb. per hour normal rating. The supply from the pulveriser is dealt with by a furnace embodying a flat double suspended arch (Liptak Furnace Arches, Ltd.) and air-cooled side walls. The boiler is one made by John Thompson Water Tube Boilers, Ltd., with a heating surface of 500 sq. ft. and a working pressure of 300 lb. per sq. in.; it is fitted with an integral-type superheater and fuel economiser, the latter being a product of the Clay Cross Co., Ltd. There are two boiler-feed pumps and a rapid feed-water heater by Frank Pearn & Co., Ltd., and the boiler is also equipped with soot-blowing apparatus by the British Soot Blower Co., Ltd. A "Sirocco" induced-draught fan and flue dust collector also form part of the installation. The instruments include steam flow and pressure indicators, CO_2 recorders, &c., by the Electroffo Meter Co., Ltd.; a Cope's automatic feed water regulator (Jas. Gordon & Co., Ltd.); a Kent boiler-level indicator; draught gauges, CO_2 recorders, temperature indicators, &c., by the Cambridge Instrument Co., Ltd.; and various indicators by Negretti & Zambra.

Another boiler installation which has been erected in the section comprises a John Thompson Lancashire boiler fitted with a mechanical stoker, made by the Crosthwaite Engineering & Furnace Co., Ltd. The stoker is fed by an Avery 2-cwt. automatic coal scale. The auxiliaries include a sectional superheater supplied by James Gordon & Co., Ltd.; flue-cleaning and soot-blowing apparatus by the British Soot Blower Co., Ltd.; an induced-draught fan by Musgrave and Co., Ltd.; water-softening plant made by the Paterson Engineering Co., Ltd.; a Lea "V" notch boiler feed meter; a Venturi recording water meter and a boiler load indicator (George Kent & Co., Ltd.); a Rees-Roturbo boiler feed pump; and an automatic feed-water regulator made by the Drayton Regulator & Instrument Co., Ltd.

One of the "engine-room" stands bears a Belliss & Morcom steam turbine, direct-coupled to a 750-kW Lancashire alternator. Near this set is a "Visco" water cooling tower and examples of "Visco" air filters. The tower is equipped with a Rees-Roturbo circulating pump. On the same stand is a 1,000-kVA transformer made by the British Electric Transformer Co., Ltd. There are also examples of "Cambridge" instruments on view. The *pièce de resistance* of the other "engine-room" stand is a compound steam engine direct-coupled to a 100-kW generator, by W. H. Allen, Sons & Co., Ltd. A steam meter supplied by Industrial Combustion Engineers, Ltd., is also shown. The last stand is devoted to an oil-fired vertical "Cochran" boiler, with a feed-water pump by G. & J. Weir, Ltd., and a temperature and pressure regulator by the Drayton Regulator & Instrument Co., Ltd.

Most of the exhibitors in this section also have stands near the section or in other parts of the building.

L. Gardner & Sons, Ltd.

This company is exhibiting a "12H.F." heavy-oil engine (65/69 b.h.p.), a "6H.F." heavy-oil engine (17/19 b.h.p.), a "4T6" heavy-oil engine (96 b.h.p.), and an "OVC" compressing set. The two "H.F." engines are of the horizontal (cold-starting) type, and the "4T6" is of the vertical 4-cylinder type, all these being constructed along recognised lines. The "OVC" is a combined engine and compressor, and its primary object is the initial charging of the air receivers for Gardner heavy-oil engines after installation of the main engine, or in cases where the pressure in the receiver has been lost.

Tangyes, Ltd.

Working models of a 47-b.h.p. heavy-oil engine (cold-starting type) and the "O.W.E.1" oil engine, lamp-starting type for electric lighting purposes are the principal exhibits of this company. The latter engine works on the four-stroke cycle, and has been developed to meet the demand for a small engine using lower compression and initial pressures than is possible with the cold-starting type, thus reducing the pressure on the various working parts. Other exhibits include Tangye centrifugal pumps, a vertical triple-ram pump, and a series of newly designed vertical single-ram pumps, a six-stage turbine pump, a horizontal duplex boiler feeder, a 40-ton hydraulic experimental press, and a selection of various types of pulley blocks, lifting jacks, &c.

Wolseley Sheep Shearing Machine Co., Ltd.

The exhibits of electrical interest on this stand are the electric lighting sets for farm and country residences and the electric sheep shearing and horse-clipping machines. The generating sets are made in four sizes, ranging from 1 to 3 kW. They all include a vertical single-cylinder petrol-paraffin engine, and the dynamo is arranged for belt or geared drive. The equipment is completed by a suitable accumulator battery and switchboard.

THE LONDON SECTION.

On passing through the Wood Lane entrance to the White City the trader cannot fail to admire the series of exhibits of Empire products and foodstuffs; it is indeed an object lesson on how such stands should be dressed, and the general scheme is considerably enhanced by the electric lighting scheme which has been admirably executed.

In the China and Glass Section of the Fair Mr. W. Moorcroft has some attractive pottery in the form of decorative table-lighting ware on view, whilst the Stourbridge Glass Co., Ltd., exhibits bowls and vases in the shape of table lamps of handsome appearance; illuminating glassware is also exhibited by John Walsh, Walsh, Ltd., and Thomas Webb and Corbett, Ltd.

Artistic Lamp Shades.

On several stands decorative electric lamp and candle shades are displayed, made of different materials in numerous styles: amongst them are the Artistic Shade Co. (hand-painted and washable), C. & O. Goring (vellum and parchment), J. M. Joseph (hand-painted silk), F. Parks, Ltd. (silk, parchment and vellum; painted wood table and standard lamps), Waite & Son (silk and linen), Wickins Durable Lamp Shade Co. (silk).

Electric Toys.

In the Toy Section of the Show several exhibitors use electric motors for imparting movement to objects displayed, and amongst the large selection of Meccano, Ltd., are toy electric motors and a large well-made model of a 3-rail railway system.

Ross, Ltd.

In addition to photographic and optical apparatus, a recently-introduced school and home kinema projector is shown; it is a portable outfit (fig. 13) weighing about 90 lb., and the illuminant consists of a 30-volt, 10-ampere filament lamp, and the light is concentrated upon the film by means of a double condenser and mirror at the back of the lamp. Before reaching the film the light passes through a water bath about 3 in. thick, which extracts the heat from the light rays so that the film may remain stationary in the gate aperture for a reasonable length of time without danger of catching fire.

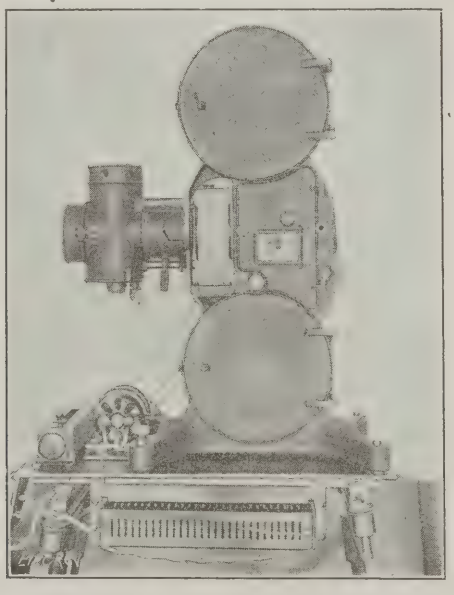

Fig. 13.—Ross Home and School Kinema Outfit.

The machine is substantially built; the main casting is of aluminium, as are also the lamphouse and condenser mount; the mechanism is mainly gunmetal and steel. A universal motor for use on alternating or direct current is provided, with the necessary voltage reduction resistance; a 3-in. lens will give a picture about 8 ft. by 6 ft., and standard films are used. The type of projector fitted in some of the largest London kinema theatres is also on view, the favourite being one provided with a "searchlight" arc lamp.

Watmel Wireless Co.

Besides screened coils, amongst the components displayed is a h.f. choke, the winding of which on an ebonite tube appears to be of a duolateral type in four sections, each bank spaced from the next, and all four in the form of a continuous winding. It is claimed that this type of winding cuts down the self-capacity, though the inductance is also reduced to some extent. The winding is mounted vertically in a celluloid tube on an ebonite base, provided with terminals and tags. In addition to a low-frequency auto-choke coupling, the firm has placed on the market a plain tapped l.f. choke, which is similar, with the exception that no coupling condenser and grid leak are incorporated. The winding is connected to three terminals giving three combinations, so that the value of the choke may be adjusted to suit any particular valve.

New London Electron Works, Ltd.

Among the radio receiving sets on view is the 5-valve model with three condensers in line with single control; cabinet work and loud-speakers, aerial wire, earth mats, &c., are also shown, and "Superial" flat copper strip, perforated to take 4 B.A. connections without solder; it can be turned and twisted easily with the fingers for wiring-up purposes.

Hart Accumulator Co., Ltd.

The company manufactures accumulators for all purposes, and its stand is one of the two largest devoted to batteries. A large variety of types is displayed, including several kinds suitable for radio reception work.

Whittingham, Smith & Co.

As their name implies, "Portadyne" radio receivers are portable sets enclosed in cabinets measuring 17 in. by 14½ in. by 8 in. deep, and provided with a carrying handle. Both four- and five-valve outfits are self-contained, including loud-speaker and batteries, but an external speaker may be "plugged in," which action disconnects the enclosed instrument.

Mr. Ernest Turner.

On this stand electrical measuring instruments for general use and wireless purposes are displayed; also a selection of condensers and coils, &c.

Universal Postal Frankers, Ltd.

Amongst this company's exhibits are electrically-driven postal franking machines containing three or six different denominations governed by one meter registering in the currency of the country.

I. Calvete, Ltd.

Besides electro-medical light-therapy apparatus and artificial sun-light lamps, electrical equipment for hairdressers is displayed on this stand, such as vibro-massage devices and hair-dryers and waving machines.

C. W. Dixey & Son.

Amongst the optical devices exhibited by this firm are various electrical aids for the deaf.

Technical Agencies Co.

This company is the agent for manufacturers of "Indurite" moulding powder and also moulded articles for the electrical and wireless trades.

Beetle Products Co., Ltd.

This company makes white moulding powders for electrical fittings, &c., and coloured powders for obtaining a translucent effect; also synthetic resins.

Birkbys, Ltd.

This company shows "Elo" synthetic resin moulded articles for the electrical and wireless trades in black, coloured and mottled colours; also moulding powders and varnish.

Scriptograph Co., Ltd.

The advertising devices shown consist of a lantern which projects moving pictures and script on to a ground-glass screen.

Radio Components.

In addition to the exhibitors of broadcast radio apparatus already mentioned, component parts and accessories are to be seen on the stands of Sidney S. Bird & Sons, Britains' Best Crystal, Ltd., Camden Engineering Co., Ltd., J.M.O., Ltd., Lissen, Ltd., Priory Loud Speaker Co., Ltd., Truphonic Wireless Co., Ltd., Western Laboratories, Ltd., M. & A. (Etherplus) Wolff, Edystone Radio Co., Ltd., and the Dubilier Condenser Co., Ltd.,

Manufacturers of cabinets for wireless receiving sets are represented by the Caxton Wood Turnery Co. and Universal Cabinets, Ltd.

Brilliant Sign Co. (1907), Ltd.

When referring to this company's display, we regret that the name "Internalite" day and night sign was applied to one of its exhibits, which, we are informed, is known as the interior lighting "Brilliant" sign.

Finally, mention must be made of the fact that, in addition to the usual postal and telegraph facilities and numerous public telephone call boxes, some three hundred special telephones have been installed on the stands of exhibitors in the section of the Fair housed at the White City.

Assisted Wiring Schemes.

The Fifth E.D.A. Conference.

THIS subject was again discussed at the E.D.A. Conference, held on February 18th, by Mr. W. F. T. Pinkney, of the Newcastle-upon-Tyne Electric Supply Co., Ltd. Mr. E. Slater (Editor of the *Electrical Times*) presided.

Mr. PINKNEY regarded assisted wiring as only a temporary measure, his view being that in the course of two or three years the necessity for it—at any rate for lighting—would cease to exist; the majority of houses would then be wired, and all new property was wired nowadays as a matter of course. He divided the methods of payment for assisted wiring into four categories, *viz.*, (*a*) short-term easy purchase of from one to two years; (*b*) medium-term easy purchase of from 2 to 7½ years (usually between 3 and 5 years); (*c*) long-term easy purchase from, say, 7½ to 10 years; and (*d*) simple hire. Generally speaking, the ordinary hire system, based upon a perpetual rental, would not become very popular with the public, nor would supply authorities be willing to offer terms which did not provide for redemption at the end of ten years or so. The companies with which he was associated had offered a system of short-term easy purchase over a period of one or two years, but it was not popular. The people who would agree to it as a rule were just as willing to purchase outright, and the system did not appeal to the tenant. The three to five years' scheme secured more business than the short term period, and, in his opinion, the 7½ to 10 year period was the best for lighting installations. The period was not so long that, with a reasonable standard of wiring, considerable cost was likely to be involved in maintenance, and the installation should still be in good condition when handed over to the consumer. Again, the tenant (as opposed to the property owner) did not consider it a great risk to make the relatively small rental payments required on a long-term easy purchase if he had to leave the premises after having paid his rental for a few years. The three main methods of payment for assisted wiring installations were: (1) the quarterly or monthly rental; (2) the prepayment meter system, with an increase in the price to cover rental; and (3) the additional price charged per kWh on quarterly or monthly accounts. He was in favour of charging rentals with the monthly or quarterly accounts, because it was the only system which did not affect the rate per kWh, and, therefore, was the only one which did not penalise liberal use. A large class of persons who were used to the slot meter system, still preferred that system. Until the problem of getting the consumer to take a supply other than through a prepayment meter had been solved, he did not see that full advantage could be obtained from assisted wiring schemes. To charge a monthly or quarterly rental for installations and to supply energy through a prepayment meter would mean doubling the cost of collection. Where it was possible to collect a weekly rental with the weekly house rent, as at West Hartlepool, this might solve the difficulty. No provision was necessary so far as lighting installations were concerned to cover the risk of disuse in the event of a change of occupancy and the new occupant refusing to rent the installation, because if a lighting installation were in a house it would be used. The danger did exist with heating or cooking circuits, however. In the case of the North-East Coast Companies the wiring was done by contractors, and so long as the contractors would work with the supply authority in a reasonable manner he saw no reason for setting up a wiring department. Only registered contractors were employed, and they had all agreed to schedule prices. For single installations these prices would not leave a large profit, but the method of canvassing enabled the companies to place orders for whole streets at a time, and a contractor able to carry out twenty or more installations could do so very economically. For a two-light installation the selling price to the consumer was £3 3s. 4d., the net price to the company £2 17s., and the monthly rental for 120 months, 1s. 3d. The prices increased progressively up to a 20-light installation, in which case the selling price to the consumer was £22 1s. 8d., the net price to the company £19 17s. 6d., and the monthly rental for 120 months, 5s. 6d. Plug points and two-way switching were installed as extras if desired. For installations of six lights or fewer the consumer had the option of paying 2d. per kWh extra on a prepayment meter. The company specified the class of material to be used, which was required to be of British manufacture. The great increase in the demand for accessories created by assisted wiring schemes, should result in lower prices, but there was a tendency towards increased prices. He hoped that the object of the Electrical Accessories Manufacturers' Association was not merely price maintenance. All supply authorities promoting assisted wiring schemes might get together and say what they required, what they considered to be a reasonable price, what a similar article could be bought for abroad, and that if they could buy at that price they could buy of British manufacture. In the case of assisted wiring schemes it was necessary to supply the first lamps; to omit to do so, particularly in the case of smaller consumers, meant that in order to cut down initial expenditure they would purchase one lamp only and carry it from room to room. There was also a tendency to use carbon lamps. With each monthly rental installation his company also included an electric iron free. That did not apply to prepayment installations. It was the practice of the company to maintain the installation (lamps excluded) for the first twelve months, but thereafter maintenance was undertaken by the consumer. It was necessary that application forms should be as simple as possible, in order that the consumer might understand them. For tenanted property a landlord's agreement was necessary. A standard figure of 30s. per service up to a certain length was charged for all services for small consumers, and this applied also to assisted wiring consumers, provision being made to cover this figure in the rentals. Particulars of service costs for underground services were given. The results obtained in 1926 were as follows:—

	Monthly.	Prepayment.	Total.
No. of applications received ...	3,021	9,064	12,085
No. of consumers connected ...	2,689	7,382	10,071
Net amounts paid to contractors	£25,052	£40,293	£65,345
Average net cost of installation...	£9 6 4	£5 9 2	£6 9 8 (average)
Annual revenue (energy only) ...	£11,500	£23,600	£35,100
Average No. of kWh used per annum	165	110*	
No. of electric irons supplied (10 months)	1,735	nil	

*Estimated.

In 1926 the actual consumption of prepayment consumers had fallen, due to the trade depression. In 1925 there were added 5,220 new consumers (apart from assisted wiring), and this could be taken as the normal rate of development. In 1926 there were added 16,472 new consumers, which included 10,071 assisted wiring consumers. The difference of 6,400 was nearly 25 per cent. above what was then the normal rate of development, so that the mere fact of offering hired wiring had secured many new consumers who had paid outright for their installations. The company was contemplating offering an assisted wiring scheme for cooking and heating circuits in residential property, and probably also water heating. Here there was risk of a hired circuit becoming disused before redemption if the period of hire were a long one. At the same time, the consumer would pay outright just as readily as he would pay rental over a very short period. The proposals provided for a five years' redemption period, and the intention was to require the consumer to guarantee to pay the rentals for three years. Heating circuits would be carried out by the contractors on a schedule, tentatively agreed upon, as follows:—

No. of radiator circuits up to 10 yds. run.	Contractors' price subject to 10% to company.	Monthly hire payments.
One	£2 12 6	1s. 0d.
Two	£5 0 0	1s. 10d.
Three	£7 2 6	2s. 8d.
Each additional circuit above three	£2 5 0	0s. 10d.
For lengths in excess of 10 yd. average run	1s. 7d. per yd.	1d. per 3 yd. or part thereof.

Cooker circuits would be run by the company's own men, because a cooker circuit could be carried out as a rule in half a day. The circuits would be surface jobs, in c.t.s. cable.

Discussion.

Opening the discussion, the Chairman gave particulars of an assisted wiring scheme in a town of 500,000 inhabitants in the United States, which he had received from Mr. A. Dow, of Detroit. There was vigorous competition by the gas company in the town. The metropolitan territory of the town had only 44,000 houses wired at the beginning of 1921, and in 1924 there were 110,000 residential consumers in that territory, as the result of the assisted wiring scheme. They were still adding at the rate of 1,500 monthly. In the period referred to, 66,000 homes were wired, and practically half the work was done by independent contractors, this representing three times the normal rate of increase of business before the campaign was started. It resulted in a total business amounting to well over £1,000,000 sterling. The

increased business of the central station had to be added to that. The scheme had prevented depression, which was imminent.

Mr. Edgar (South Shields) said that the prepayment meter was necessary in some cases. A considerable number of consumers were using irons, kettles, and other small apparatus on assisted wiring installations where prepayment meters were installed. The question of using larger apparatus, such as cookers, was a subject to be considered in relation to an alternative scheme to that of lighting. In no case at South Shields had there been the slightest difficulty with new tenants. In a number of cases the incoming occupier had paid the outstanding balance for the installation. At South Shields everything was supplied up to the lampholders. His experience showed that if schemes were carefully considered there was not the slightest doubt about their paying. The scheme in South Shields was commenced on May 12th, 1925. For the year ended March, 1925, there were connected to the supply mains a little over 4,000 domestic premises. At the end of June, 1925 (six weeks after the commencement of the scheme), there were an additional 750. At the end of December, 1925, there were 3,750 additional consumers; June, 1926, 8,902; December, 1926, 10,856. During 1926 the scheme was curtailed considerably owing to the indifferent coal obtainable, but the number of consumers actually connected under the scheme to date was 11,231. The average revenue per consumer was equal to 18.06 per cent. of the capital cost for mains and services, after deducting the extra charge of 2d. per kWh to cover the cost of installation and prepayment meter. Only a limited number had been connected for a full twelve months, and when the 11,231 consumers had been connected for twelve months the average revenue per consumer, as compared with the capital cost of mains and services, would probably reach a figure of 25 per cent. The capital cost of consumers' installations and meters from the inception of the scheme to date was £93,073, of which 6 per cent. had been recovered by the extra charge of 2d. per kWh, and the total revenue to date was £23,398.

Mr. C. H. Rayner (Manchester) said there had been some very satisfactory cases in Manchester recently in which landlords had wired a number of the houses they owned, in consideration of a small increase in the weekly rents.

Mr. A. C. Bostel (Hackney) said that in his district assisted wiring schemes were carried out under two systems, *i.e.*, extended payments for purchase, and free wiring. In such a district it was necessary to use prepayment meters to a large extent, and the charge for energy through those meters was 8d. per kWh, as compared with the ordinary flat rate of 5d. The lead-covered system of wiring was adopted, and the cost varied according to the number of lights. For a six-light installation the cost was sometimes as much as 27s. 6d. per point, which included switches, lampholders, ceiling roses, and lamps. If a cooker were installed, the supply authority provided it, carried out the wiring, and supplied through a separate prepayment meter calibrated at 1½d. per kWh: that was all the consumer paid.

Mr. F. H. Howell (Battersea) said that at Battersea there was a free-wiring system, which had been in operation for nearly two years, but there were not yet 1,000 consumers under that scheme. There was a standing charge per quarter of 16s. 3d. for six lights, plus 1d. per kWh for energy consumed. Very heavy lampholders were installed, so that consumers could use other apparatus. Irons were hired at 1s. per quarter, and kettles at from 1s. 6d. to 2s. (according to size), as well as cookers and fires. The scheme worked very well, and about 1,200 pieces of apparatus had been installed in 18 months.

Mr. F. W. Leevers, commenting on Mr. Pinkney's reference to price maintenance, said that the manufacturers to-day were very keenly alive to the necessity for the maintenance of quality. Cost of maintenance must be considered as well as first cost. "Electricity is cheap" was a "slogan" which should be constantly employed. He thought that electricity supply authorities might offer assisted wiring schemes to manufacturers to help them in the installation of the larger current-consuming apparatus.

Mr. H. W. Watts said that twelve months ago he had got a two-part prepayment meter into this country. They were used in thousands on the Continent, and the makers had a switch which would control the meter up to 20 A. The meters could be calibrated for any amount of shillings up to 15, and for any price per kWh. Such a meter was wanted badly for assisted wiring schemes, and he was sorry that no British manufacturers had placed one on the market.

Mr. S. B. Howard (Marylebone) said that in his area in the case of assisted wiring installations, the two contractors nearest to the premises to be wired were asked to tender, and the better was accepted. There were slot meters for any size of cooker. For one room they charged 6s. 6d. per quarter plus 1d. per kWh, and for two rooms, 7s. 6d. plus 1d. No charge was made for services.

Major Whittingham (managing director, Sussex Electricity Supply Co.) said his company had started an assisted wiring scheme, and provided lamps and shades. If they were not supplied, what assurance was there that the right type of globe and shade would be used? Should two-way switches be supplied as an extra, or omitted?

Mr. W. Ritchie (Hendon) stated that a weekly rental, ranging from 8d. for a four-point installation to 1s. 1d. for a nine-point house, plus the charge per kWh, was offered to his consumers, or alternatively, a supply through a slot meter, with an extra charge of 2½d. per kWh, and no fixed charge. He preferred the 1s. rather than the 1d. slot meter.

Mr. W. H. Edridge asked if assisted wiring schemes were wholly self-supporting?

Mr. Pinkney, replying to the discussion, said the selling prices of the installations provided by his company included lamps and shades. Two-way switching was supplied as an extra, if required. He could not see the advantage of the two-part prepayment meter. The collector had to take the ordinary money for energy from the meter, and it was just as easy to take the standing charges from the consumer as from another part of the meter. A disadvantage was that if a consumer had been away for a considerable time, he would have to put in a number of shillings to cover the standing charge for that period before he could get energy—and he did not like doing that, and the meter would have to be separately calibrated for every consumer. In reply to Mr. Leevers, he said his company would consider any industrial case that would show a commercial result. His scheme was self-supporting. The mains were not extended unless the company was satisfied that the business resulting would jutify it. Propaganda costs were included in the general costs of supply, but he could not say what percentage of the revenue had been charged to propaganda to obtain the new consumers connected under the assisted wiring scheme.

The Canadian Market.

General Prospects and Methods of Attack.

THE British exporter who wishes to extend his sales in the Canadian market has many problems to face. His chief difficulty is the presence just across the southern border of the Dominion of a formidable competitor who has penetrated the market in many directions and in many ways. The substantial financial interest of the United States in Canadian industries has led to the installation of a great deal of American machinery, the appointment of numerous American managers and foremen, and the fairly widespread adoption of American standards and methods. It is largely under these conditions that Canada has become as important industrially as agriculturally; consequently, keen competition has also to be faced from the factories of Ontario.

Another fact which is probably insufficiently recognised is that Canada is not one but several markets. There is Quebec, served by two great open ports in summer and by Halifax and St. John's in winter; in this province 80 per cent. of the population speak French. The sale of equipment and machinery must usually be effected by calling at works in various sections of the province. There is Ontario, with its active industrial cities of Toronto and Hamilton—the largest distribution centres of the province. The northern Ontario mining camps are large buyers of machinery, chiefly through Toronto and Montreal. Then there are the three Maritime Provinces containing, in Nova Scotia, the extensive works of the British Empire Steel Corporation. Turning west, the Prairie Provinces of Manitoba, Saskatchewan, and Alberta, have few factories, and at present mainly depend for their purchasing power on the success of agriculture, though mining and oil exploration are developing. This territory is being supplied to an increasing extent through Vancouver—an important change from the point of view of the British exporter, as will be seen later. Finally, there is British Columbia, formerly the most inaccessible province of the Dominion and now one of the most easily reached, owing to the opening of the Panama Canal and the establishment of direct services between British ports and Vancouver.

The many questions involved in catering to Canada's varied requirements are dealt with exhaustively in an admirable report by Mr. F. W. Field, H.M. Senior Trade Commissioner in

Canada, which has just been issued by the Department of Overseas Trade.

The value of the market, he points out, is materially increasing, and those firms who grow with the market will have substantial advantages. It is 3,729,665 square miles in extent, and over this large area is scattered a population of about 9,364,000.

Branch Works.

Mr. Field discusses in detail the several methods of representation which have been adopted by British firms with varying success. He gives first place to branch works, and on this subject his remarks will be of particular interest to the electrical manufacturer. Several British firms, he points out, have acquired an interest in Canadian manufacturing firms, but in these cases the British firms do not export to Canada.

One of the principal reasons for the substantial investment of the United States in branch factories is the desire to secure, as Canadian manufacturers, the benefits of British preferential tariffs. In the majority of cases it will probably be found that British manufacturers are able to export from their home works and do a profitable business in Canada. In certain industries, for various reasons, branch works of some sort may be necessary in order to transact a business of permanence and value. But many British firms might give careful consideration to the question of establishing a branch works in conjunction with an adequate selling organisation. If, after the most searching investigation, this course should be chosen, the firm may find it desirable to limit its initial operations to the assembling or manufacture locally of staples in everyday demand in the Dominion, utilising the distributing organisation of the local branch factory for the sale of the firm's more specialised finished products, which can be imported from the home factory, along with such semi-finished products or parts as are necessary.

In deciding to establish branch works, one of the first questions demanding consideration is whether it is more satisfactory to start an entirely new organisation or to proceed by associating British capital and experience with those of an existing Canadian organisation. Mr. Field says that a definite recommendation cannot be made in regard to a matter of this kind, but that there are many advantages in adopting the latter course.

A policy which has been followed by makers of machine tools, electric motors, and other machinery and equipment, is to establish their own branches in the Dominion, with repair shops. They must be careful to maintain stocks at important points adequate to, but not in excess of, actual requirements.

On the subject of agents on commission, Mr. Field considers it desirable, in view of the losses which some British firms have sustained in recent years through the appointment of unsuitable agents, or because suitable agents have not received the proper support, to repeat certain cautionary remarks which he has made in previous reports.

Hope for Trade Expansion.

For engineering firms a method of representation which has proved successful in more than one market is that of a joint arrangement among non-competitive concerns. Mr. Field's belief is that in this method, properly operated, lies considerable hope for the expansion of British trade. He supports his opinion by pointing out that three of the factors which have operated in the past against greater business in machinery and engineering supplies are the lack of sufficient local representation and active salesmanship, the failure of British manufacturers to keep in constant touch with those who have purchased their machines, and the inability to effect repairs and supply spare parts at short notice.

While the business in any one line may not be large enough to justify the establishment of a proper local organisation, which should remove the difficulties noted, it might prove feasible for several manufacturers of non-competitive machinery to have joint representation here, with a technical man to look after repairs, a good sales organisation which would adopt the American "follow-up" system, as it is termed, and a stock of the spare parts which are most likely to be needed.

Mr. Field adds:—"Several British firms who have either Canadian branch factories or offices are in a position to represent other British firms. By undertaking the representation of other British firms in somewhat similar lines the overhead expenses of the firm already established here are reduced and a good selling organisation is provided for other British firms at comparatively low cost."

The Personal Touch.

The Trade Commissioner emphasises the desirability of a personal investigation of the market in order to ascertain its possibilities and decide upon a course of action. In this connection he makes some useful suggestions regarding a suitable itinerary and also gives details of the time and expense involved. The best procedure to follow in respect of samples is also described. Attention is drawn to the facilities for storage and distribution which have been established by several reliable firms in most of the important cities of Canada

Mr. Field finds it necessary to draw particular attention to the fact that Canadian buyers attach much importance to deliveries, not only for the usual commercial reasons, but often on account of special considerations. The construction season in certain parts of Western Canada is of short duration. Contractors time their operations to a day, and are often under heavy penalties if their work is not then concluded. Sometimes delivery is required at a particular time because navigation to a certain port closes for the winter, or because machinery can be taken into a lumber, mining, or construction camp only on sleighs over the snow. Thus there are many good reasons why Canadian buyers must often insist on delivery by a certain date.

Publicity.

An interesting section of the report is devoted to publicity, embracing such varying media as kinema films, press advertising, attendance at conventions, exhibitions, and wireless programmes. In introducing the subject, Mr. Field makes the rather startling pronouncement that the cause of British trade has undoubtedly suffered from despatches which have appeared in sections of the Canadian Press. It appears that doleful and even harmful news concerning economic conditions at home finds its way through the foreign agencies.

Mr. Field observes that anything further which can be done by British manufacturers collectively and by the United Kingdom and Canadian Press and Press agencies in this direction, will be of immense value in helping to create a better selling atmosphere for British goods. He adds that the kinema film has also operated against British trade. The production, distribution, and exhibition of films in Canada is almost entirely controlled by foreign interests.

After referring to the necessity for keeping in personal touch with consumers, the report discusses the question of advertising generally. He says that while British firms, as a group, have increased their advertising in the Canadian market in recent years, firms of United States origin are still among the largest patrons of advertising space in Canada. Good results have accrued from advertising in Canada which has been properly planned and directed. There are so many factors peculiar to the Canadian market to be considered in an advertising campaign that he suggests expert knowledge of the Canadian market should be secured, say, by the combined assistance of United Kingdom and Canadian advertising agencies.

The manufacturers of the North American continent look upon advertising in the daily, weekly, monthly, trade and technical Press as an excellent investment. While this may be the same in the United Kingdom the policy of the United Kingdom firms, as far as advertising and publicity in the Canadian market is concerned, is, generally speaking, weak. Yet, with the keen competition to be met in all lines and in a market which buys largely the goods for which publicity has helped to create a demand, it is necessary to have a continually favourable atmosphere to assist a salesman. Spasmodic advertising is of little value. A well prepared and properly conducted campaign, over long and repeated periods, gives the greatest service. This market lacks the favourable publicity atmosphere which our competitors have there, and a change in this condition is a matter of great importance.

Mr. Field makes some observations regarding the Chicago Underwriters' Laboratory and the effect of its rulings on the sale of British electrical appliances in Canada. He refers in his report to the provision in the Dominion tariff for assisting the development of industries in Canada by exemptions from, or reduced rates of, duty on certain articles utilised in such industries. It is to be feared, however, that this concession is not likely to be of much service to the British electrical manufacturer.

Switchgear in the United States.

Writing to the *Electrical World*, Mr. M. M. Samuels, of the J. G. White Engineering Corporation, says: "Rupturing capacity guarantees were always a joke. No manufacturer was ever ready to submit the figures upon which his breaker rating was based. When a transformer or a motor or a turbine is purchased, there is no mystery about the guarantees; the constants and calculations upon which they are based are available. Not so in the field of breakers. . . . Large public utilities did make a great many tests recently at their own expense—the only tests of any value so far. But why did these public utilities undertake these tests? Why did they select breakers instead of any of the other thousands of articles which they are regularly purchasing? They found that they were spending millions on switches about which they could get very little information, and after spending all these millions they found themselves losing fortunes through service interruptions without any possibility of ever collecting anything from the manufacturer on a rupturing-capacity guarantee. Therefore they made up their minds that they were going to find out for themselves. All credit to them. If they keep up the good work, they will find out a great deal. They have already found enough to make the manufacturers refuse to give any guarantee on rupturing capacity. Who ever paid money for a piece of property because the man who sold it 'believed' that he had a deed? What is needed in the switching game is not merely bigger tanks, more oil, heavier contacts, &c., but new ideas, radically new ideas. Not development, but invention. What is the matter with the American inventive genius?"

Electrical Wholesalers Federation.

Annual Dinner.

THE annual dinner of the Electrical Wholesalers Federation was held at the Savoy Hotel, London, on February 24th, when some 230 members and guests were present. and Mr. G. P. Dennis, president, took the chair.

The Rt. Hon. Viscount Peel, P.C., proposed "The Reorganisation of the Electrical Industry." He said that in the Electricity (Supply) Act, 1926, the Government had taken full advantage of the knowledge of the State. The connection between the Government and science was growing closer each day. He thought that perhaps it was unfortunate that in this country we were the pioneers of the electrical industry, which had had to adapt itself to old houses. He agreed that there had been some State interference in the industry; but the Government was trying to harmonise those imperfections which the lack of co-operation between politicians and science had brought about. What was wanted was the minimum of State interference compatible with the production of electricity on the maximum scale. He did not think that any measure had been submitted to such thorough investigation as the Act had. As a result of the Act there must be a vast increase in the use of electricity, and if it did not also result in a large reduction in the price of electricity then the Board and the Commissioners should be scrapped. He congratulated the societies who had brought about the concordant clause in the Act. He believed that the country would return to those simple virtues which had made us great. In the chairman of the Board they had a man with all the qualities essential for the control of a great business.

Lt.-Col. J. T. C. Moore-Brabazon, M.P., seconded the toast. He said that he had been associated with the electrical industry for two years in trying to build up a measure of reorganisation, and he had no lack of confidence in the Act. He felt that it would result in progressively greater benefit as the years passed. In referring to his new enterprise in the treatment of coal, he said that they must face the cardinal fact that coal was the basis of industry in this country. It was necessary for all parties to put in the whole of their weight; he did not think that the railways were doing this. Was it right that on the north-east side of London there were no plans for suburban electrification? The railways had recently taken £6,000,000 out of reserve, but there was not a word of electrification. He had recently seen the domestic power curve of an important American company, which showed its maximum load in the summer, due to the refrigerating plant installed; that showed what could be done.

In reply, Mr. R. W. L. Phillips, president, I.M.E.A., heartily congratulated all those who had been elected on the Board. His Association was looking forward with the utmost confidence to the result of their deliberations. Most supply engineers would soon cease to be manufacturers and become distributing factors. But the electrical engineer had always been used to reorganising, and had worked along the lines of the Royal slogan, "Adopt, adapt and improve."

"The Electrical Wholesalers Federation" was proposed by Mr. D. N. Dunlop, director, B.E.A.M.A., who reminded the company that at the last dinner it was suggested that his Association did not do all that it might for the contractor, and that the conference which was arranged for the next morning had resulted in Clause 48 in the Act, which gave the contractors a status. Success was impossible without the hearty co-operation of all the representative bodies. He suggested that Sir Andrew Duncan and his colleagues, without waiting for the "grid," might bring pressure to bear upon those undertakings where the charges were high. He thought the people of the country were sufficiently well educated electrically to adopt electricity if it were obtainable at a reasonable price. Cheap electricity in this country was only possible with cheap coal; he was pleased that there was to be a fuel congress in 1928. The wholesalers excelled in salesmanship—not to the public, but to experts. If Clause 48 overcame the tendency to buy off the foreigner, it would bring about a reduction in unemployment. He suggested a further conference of all the associations to evolve a scheme which would be to the benefit of all interested.

In reply, the President said that all were greatly impressed by the responsibilities that had to be taken, not only by the Government and the Electricity Commissioners, but by the whole of the electrical industry, in order that there should be a co-ordinated system of all concerned. The underlying principle governing the organisation of the industry was to do the best for Britain. The greatest good could only come to the nation when all its members put into the industries the maximum amount of energy, time and thought of which they were capable. The electrical industry was, next to coal, the key industry of the country; it was safe to prophesy that electricity would be available in every household throughout the country. The problem of electrical service was not only to generate cheaply, but to endeavour to supply the complete installation, at the least possible cost. One of the chief aims of the Federation in supporting and sustaining the manufacturers was to guard and protect them against the financial bad patches that existed in Great Britain. They required in British-industry leadership three essential qualifications, vision, vigour, and insistence. All must work to the same end, stimulated by a common purpose to place Great Britain pre-eminent in the manufacturing world. The labours of the trade combines in the country had not produced the results hoped for, because they had been individualistic. They had recently had a glaring example of the effect on British industry of sectional working. A number of battery manufacturers formed a ring, the object being to sell to the user only. The wholesaler and contractor naturally looked about for fresh supplies. His Association endeavoured to get in touch with the ring to see if a working arrangement could not be made, but could not even get a reply to the letters sent. The result was that there was an enormous increase of imports, and the manufacturers themselves lost thousands of pounds of orders.

In proposing "The Guests," Mr. A. G. Beaver said the Federation was particularly honoured by the presence of Sir Andrew Duncan; it was the first electrical function that Sir Andrew had attended. The chairman of the Board could see the harmony which existed between the representative bodies in the industry, all of which would give him every assistance.

Sir Andrew Duncan, in reply, said he was glad to have accepted a position of service in an industry which would play such an important part in the future progress of the country. He felt that it would be wise to approach his new sphere with caution and not disclose too much too early. He thought that if the new child, the Electricity Act, was not nursed into healthy manhood, then the blame should rest with Col. Moore-Brabazon.

Mr. H. J. Miles, president, N.E.C.T.A., also replied, as did Mr. P. J. Brewer, chairman, E.L.M.A.; the former said that the bringing together of all sections of the industry, due to the efforts of Mr. Dunlop, had made the position satisfactory. Mr. Brewer stressed the point that the machine of co-operation was not yet ideal. Whatever happened, the fullest co-operation possible was wanted between the various associations.

The proceedings concluded with the toast, "Our Chairman," proposed by Mr. George Donovan. During the evening musical items were rendered by Mr. Topliss Green and Miss Ethel Sanders.

Correspondence.

Correspondents should forward their communications **as early as possible.** *No letter can be published unless we have the writer's name and address in our possession.*

Electric Power on the Farm.

As a result of my article on "Rural Electrification and Agriculture," published in your issue of February 11th, I have had many letters from technical experts questioning the advantages of direct haulage of ploughs, &c., over the old wire-winding system.

Let us look broadly at this question and take East Lothian, where the standard of cultivation is second to none, as an example.

Some years ago there were many steam ploughing sets at work here—to-day I do not know of a single set, the wire winders are extinct. On the other hand, practically every farmer has a tractor, and a good proportion have two; in other words, direct haulage is universal.

Another example: Edinburgh 20 years ago equipped herself with a well-laid-out system of steam-driven cable cars, wire-hauled. They were scrapped last year and the direct haulage electric trolley has turned what was a failure into a conspicuous success.

I don't know of a single surviving example of wire-hauled cars; are they, too, extinct? In other words, practice has proved that it is more efficient to transmit power electrically than through a wire-haulage system.

Again, let us look at the problem from the farmer's economic standpoint.

Let us suppose the big wire-winders are the only practical machines; the farmer hires a set, gets his ploughing done, and the wire tackle moves on. The farmer is left in the spring time (when his peak load occurs) without any power-driven implement on his farm, and presumably with fewer horses than he normally would keep. How is he to carry on? He is in a similar position to that which he occupied with the old steam winders which he has ceased to employ.

No, Sirs, what the average farmer with 250 to 500 acres requires is a light tractor—reliable, cheap, and long lived; he must have it all the time, and his power unit should be so designed that normally the ploughing of the farm should be a one-man job. With cheap power this will lead to an increase in arable and a reduction in grass land, for the farmer will strive to keep an economic machine at work, and the horses, which will be considerably reduced in number, will mainly be used for the farm transport work except in the spring, when they will follow the power-driven cultivator and grubber and generally do what we may call the "gentleman's jobs." Then, again, when the crops are sown and the increased acreage of arable has led to an increased green crop of turnips, potatoes, and sugar-beet, the decreased horse staff

will be unable to undertake the drill-grubbing and cultivation which is essential to the success of these crops.

The tractor must again come to the rescue, and I may say that in designing my tractor this drill work was specially kept in mind; the flank wheel forming the third point of support is mounted on a slotted shaft, so that the breadth of track may be altered to suit any width of drill.

When the foliage closes the drills, hay and grain harvests are waiting, and again, if required, the light tractor can do the reaping; and when the stubbles are cleared the tractor-man hitches on his plough and starts his cycle afresh. How can the wire winder, which is useless among crops, hope to compete with the above?

It will require a bellyful of power for a short period and a power line designed and built to supply that power (which will be idle 70 per cent. of its time).

As a farmer I don't like the idea, and I think I can guess the feelings of the power engineer.

Andrew McDowall.

Mungoswells, *February 22nd*, 1927.

Power Supply for Wireless Sets.

I trust you will allow me a final letter in reply to that of Mr. Turner in your issue of February 18th, after which I will not trouble you further.

Briefly, the receivers I had in mind are manufactured by Standard Telephones & Cables, Ltd., although they are not marketed under that name, and as apparently Mr. Turner has acquaintances connected with that company, it should not be very difficult for him to obtain the apparatus for test. He admits he has not tested it, but allows that Standard Telephones *should* be able to make a good receiver, which is not surprising in view of the fact that this company was responsible for most of the apparatus in connection with the recently inaugurated transatlantic telephone service.

Should Mr. Turner be able to obtain facilities for a test of this 4-valve receiver, he will be able to find out for himself whether my contention is self-evidently absurd or not. My tests give me the following figures: 2-valve tuner, 3 mA at 12 volts, 2-valve amplifier, first valve 2 mA at 60 volts, last valve 4 mA at 120 volts. I am quite willing to leave the quality of reproduction also to any of Mr. Turner's tests.

If after test Mr. Turner still will not agree that distortionless reproduction can be achieved with this low wattage, I should be very interested to know on what tests he bases his contention. If it is possible later to arrange a test, it seems to me that it should take place in my district, a difficult spot on the South Coast, and not in London, in order to obtain a comparison under not too easy conditions. I should prefer, however, that Mr. Turner tests the apparatus for himself.

It will be obvious that before I can consent to any independent test I must obtain, if not the co-operation at least the consent, of the manufacturers.

Interested.

February 19th, 1927.

Electricity Supply Tariffs.

I have been very interested, on my return from South Africa, in seeing the article by Prof. Cramp on "Electricity Supply Tariffs," as it confirms my article, "The Revival of an Old Tariff," in your issue of July 2nd, 1926.

My firm's order book shows an increase in the use of the two-rate system of charging all over the world, and it seems to me that this system will be an absolute necessity if the valley which most stations show in their load curves during the night hours is to be filled up with water heating, as I firmly believe it will be.

Prof. Cramp gives a testimonial to the ingenuity of Swiss inventors in having produced "a wonderful series of automatic time switches." I should like to show him that England is in no sense backward in this direction, having a world-wide reputation second to none for this class of apparatus.

I hope that when he is next in town he can spare time to give me a call, when I shall be very happy to show him a few of our "marvels."

Ernest E. Sharp,
Director, Venner Time Switches, Ltd.

London, *February 14th*, 1927.

Kiosk-type Sub-stations.

I am fully aware of the principal reasons for substituting the above type of sub-station for the brick-built type of e.h.p. systems, but why lower the standard of safety as embodied in the design of most of the modern sub-station switchgear?

It is no use blaming the manufacturers for introducing cheap switchgear into the design of these kiosks; rather should this rest on the users who encourage them to supply it, for after all they are the persons who have to handle it in service and who should know what constitutes a safe and sound engineering job.

In power stations of to-day, and under much more ideal conditions, the design of e.h.p. switchgear is such as to reduce to a minimum the possibility of accidental contact with live metal, and I consider that those whose duty it is to install and operate e.h.p. switchgear in outdoor kiosks should see to it that the operator is amply protected.

I have recently had occasion to draw up a specification for the interior requirements of a 6,600-volt kiosk, and knowing the possible conditions under which a person may have to operate the switchgear, I could only come to one conclusion, namely, that of specifying totally enclosed, metal-clad, drop-down type units.

This type of switchgear costs a little more, but has many advantages for this class of sub-station over an ordinary oil switch and bare isolating links, and is well worth the extra cost involved—if only from the point of view of safety.

The primary object of introducing kiosk sub-stations was to economise on land and buildings, both as regards the cost and obtaining of suitable sites, and not to expose persons to danger by cheap arrangements of switchgear.

Why not start and cut down the expense of the transformer?

I will go one further than "P.M.W.," and instead of suggesting additions to the open-type switchgear, I would suggest to the manufacturers that they scrap the present design of the e.h.p. chamber and substitute gear of the totally enclosed type, which can be made very compact and safe, and at least offers an equivalent protection to that obtaining in well-designed sub-stations or power stations.

The remedy is in the hands of the users, and any economy they wish to make in respect of the cost of sub-station equipment should be consistent with safety and efficiency, particularly with regard to e.h.p. switchgear.

P. Wardle.

Walsall, *February 26th*, 1927.

With reference to the letter by "P.M.W." on the above subject, which appeared in your issue of February 25th, 1927, I should like to express my full agreement with his general conclusions.

At the same time, I feel that it is necessary to draw your attention to the fact that one manufacturer of kiosk sub-stations—*viz.*, The General Electric Co., Ltd.—has been quoting for and supplying kiosks for several years, which do embody every essential precaution to adequately protect a visiting attendant from the danger of accidental contact with e.h.p. live metal.

It is essential in kiosk design to construct the switchgear in a manner which fully complies with H.O. regulations, and in order to do this, proper attention to the enclosure of the h.p. isolators is perhaps the most important point.

In the General Electric Co.'s standard design, whether for single incoming-feeder equipments, ring-main, or other feeder requirements, the isolating links are enclosed in independent cells or cubicles for each individual feeder or transformer circuit. These cells have separate lock-up doors inside the main doors of the kiosks.

After opening the isolator links, their covering doors can be closed and locked, so that the attendant can clean or inspect the oil switch and transformer in perfect security without any risk of slipping, or of being blown by high winds, into accidental contact with live metal.

Alternatively, completely enclosed "armourclad" draw-out h.p. switchgear may be sometimes employed, this being housed inside the kiosk. The leaflet enclosed herewith gives a reproduction of the illustration of a G.E.C. kiosk which was printed on page 1009 of your issue of December 17th, 1926, and which clearly shows the inner door construction.

Herbert J. Coates.

Birmingham, *February 26th*, 1927.

The Earthing of Portable Domestic Appliances.

In the Electrical Review for February 25th, I read with interest the letter written by "A.M.I.E.E." regarding the earthing of all electrical appliances, which I think is a necessity; but as there is no law compelling contractors to take the steps required for safety, they are bound by the low prices they have to quote (to stand any chance whatever) to put in only what they are compelled to provide. I have the greatest admiration for the Institution of Electrical Engineers, and I think if that body laid this matter before the Home Office it would receive all-round satisfaction, because every contractor would be compelled to see that all appliances were earthed, and all corporations would be compelled to examine that earth and see that it was satisfactory; further, it would tend to help contractors to give estimates with the satisfaction of knowing that all other contractors were compelled to do the same. It is a matter that needs fostering for the consumers' safety, and while the majority of consumers are ignorant of its importance, the majority of contractors are neglectful.

Joshua Rose.

Bacup, *February 25th*, 1927.

The Salaries of Engineers.

Surely your correspondent, "Another Poor Blighter," is aware that the question of engineers' salaries will never ruffle the placid minds of the Council of the I.E.E. Obviously these gentlemen are quite satisfied with their salaries, and consider it somewhat vulgar for the lesser fry to mention such a sordid subject.

All other bodies which profess to look after the interests of engineers seem to be very keen on improving their social status without thinking of the possibility of obtaining increased salaries to keep up such social status as they already have.

I quite agree with your correspondent's remarks in connection with the post mentioned, but this is by no means an isolated instance. One has only to scan the "Situations Vacant" columns in the electrical Press to gain ample proof of this.

It is high time that the I.E.E. Council should bestir itself and take up the question of fixing minimum salaries for electrical engineers. If this august body *will not* move in the matter, anybody who will seriously take up this question of salaries, neglecting social status, will, I am sure, receive ample support from the rank and file.

Yet Another Poor Blighter.

February 25th, 1927.

River Water—or Cooling Towers?

Owing to illness I have only just seen Mr. Waite's most interesting article and the ensuing correspondence, or I should certainly have had something to say on the matter at an earlier date.

I quite agree with his general argument and with his contention that, things being as they are, reliable test results are the only criterion to go by. Also I have every reason to have absolute faith in the accuracy of his test figures. But it is easy to recognise what machines have formed the basis of his argument, and I do not think it is right to employ test results on medium-powered turbines more than 10 years old to settle a 1927 problem. From actual test results on two types of machines of larger output, recently set to work, I think that he has very considerably overestimated the defect from the theoretical in the really modern machine. The gain in steam consumption on different types of large modern turbines at 0.9-in. Hg, compared with 1.8-in. Hg, we find to be 6.0 per cent. as an average figure at full load compared with Mr. Waite's 4.0 per cent., an improvement of 50 per cent., which may conceivably influence the argument.

E. Fawssett.

Riding Mill, Northumberland,
February 23rd, 1927.

Extra-High-Pressure Cable Discharges.

I was recently informed of two instances of a curious phenomenon connected with super-pressure cables. It would appear that the cable in question had been tested with high-voltage direct current, and after the test this cable was discharged and all three cores were then permanently connected to earth at one end of the line only. Some hours afterwards a potential had apparently built up on the cores at the other end of the line, and a man proceeding to work on the cable received a severe shock.

The case of a cable building up in potential after a temporary discharge is, of course, well known. The theory of dielectric absorption and resistance which accounts for this does not, however, offer any satisfactory explanation when one end of the cable remains connected to earth.

I find it difficult to accept my information, and I should like to know if any of your readers can recall similar occurrences and can put forward any theory to account for same.

D. P. Sayers.

Blackburn, *February 23rd*, 1927.

A Handicap to Electrical Progress.

Mr. Ivan Fawcett in his letter to you of February 11th registers amusement, and, to do him justice, does it very well, but it shall be said of him, as of someone else whose name escapes me, "nihil tetigit."

I live in Rome and reside in the suburb of Cloaca Maxima. The electricity supply authorities in that particular neighbourhood have had £3 of my money for the last 14 years. They had it from me at a time why my credit was good, and for reasons best known to themselves. You see, they are not commercial. They have done nothing to my meter for 14 years except read it. I pay very little for what power I use, and don't worry, as I know that they are not business people in the ordinary intention of the term.

I think it would be a great mistake to complain.

F. Curius Dentatus.

February 21st, 1927.

A Metering Problem.

At a certain factory taking a supply at 415 V, 3-phase, 50 cycles, the energy was measured by an "Aron" 3-phase meter, in conjunction with a "Reason" mercury max-demand indicator, this combination working from the usual current and potential transformers. The supply company recently removed the transformers, and installed a "Sangamo" 3-phase meter, with its own transformers, but connected the "Aron" meter in with it; with the result that neither meter reads an amount anywhere near the previous reading (when the "Aron" meter was running off its own transformers), and there was also a difference between the "Sangamo" and "Aron" of approximately 4,000 kWh in a little over a week. Thereupon the company installed a portable meter (also *on the same transformers*), to check (?) the other two. No two of the three meters read alike. The company now claims that the "Aron" meter has *never* read correctly, and proposes "averaging" its presumed loss (I do not know how), on the "Sangamo" meter's reading, which is considerably higher than the "Aron" meter has ever been.

In my opinion, it is utterly impossible to connect three totally different meters to a set of current and potential transformers which have been designed to operate one particular meter. The load is a 250-kW motor-convertor (Peebles), and about 32-kVA of induction motors and a heater. There are no unbalanced conditions.

E. H. K. P.

February 20th, 1927.

"Do It With Electricity."

In view of the ever-increasing activities of the E.D.A., and kindred organisations, to further the sale and use of things electrical, a little commentary based on the observations of a "looker-on" who sees *much*, if not *most*, of the game, may be helpful, if not pleasant, reading.

In a nutshell a very large volume of valuable electrical business is passing out of the hands of the electrical trade, whilst their various associations of contractors, wholesalers, and manufacturers sit wasting time round their conference tables in solemn conclave denouncing their satellite associations for *doing*, or *not* doing, "this, that or the other"; instead of sitting up and taking notice of what is actually going on under their very noses.

In the first place, I notice that contractors, wholesalers, power undertakings, and even manufacturers, absolutely neglect the biggest potential field to which they should address their activities, *viz.*, the *industrial* field, which is over-ripe for *more* and *more* electrical labour-saving tools and appliances.

Take a glance at the window displays of the average electrical contractor, wholesaler, and supply authority. You observe there all sorts of frills and fancies; expensive fittings and gadgets, to tempt the money from the already strained pockets of the more affluent householder; but there is utter absence of any of the ever-growing array of labour-saving tools, &c., that are the potential life-blood of industry, whether it be the individual artisan or the larger works and contracting organisations.

Let us take a few examples:—

(1) *The Portable Electric Drill.*—This tool in various forms and sizes, has entered into the daily life of practically every branch of industry; the demand is daily increasing, and thousands are being supplied weekly, yet what do we find? Scarcely *one per cent.* of the electrical drills sold are handled by electrical contractors or wholesalers; but they have made a nice steady and profitable turnover for others who have seen the market and have created, stimulated, and met the demand! Even the motor accessory wholesale houses are selling literally thousands of electric drills (apart from other electrical gear) which would never have been allowed to get into their hands if the electrical trade had kept in advance of electrical progress and had cultivated the markets that should be theirs, by heritage, if not by right.

There is scarcely a laborious manual operation for which an appropriate time-saving electrical equivalent is not available. The writer is associated with an enterprising young firm that scours the world's markets for electric labour-saving tools and appliances and puts the cream before the potential users.

(2) "*Electric Hammers*" that can cut through brick and concrete at the rate of an inch a minute, *30 times as fast as hand drilling*, and can be operated from an ordinary lighting point. Now this is an ideal electrical contractor's tool, and is in use by a number of wide-awake contractors; but the average contractor thinks £40 or £50 a big outlay. So is the too-heavy wages-bill for the more laborious method.

(3) Electric hand-saws for ripping or cross-cutting timber up to 3¾ in. thick.

(4) An electric hand-planer does away with jack planing, &c.

(5) An electric portable sanding machine for smoothing-off wood work.

(6) A portable electric mortising machine.

(7) Portable electric cloth-cutting machines for cutting out thick layers of various fabrics.

(8) An electro-hydraulic car-washing plant which reduces washing costs by two-thirds.

(9) Portable and universal electric grinders.

(10) Universal electric sawing, sanding, and grinding machines.

(11) Portable electric screwdrivers and nut-setters.

(12) Portable electric valve grinders, and so on. . . .

These are but a few of the electrical industrial appliances that we are handling every day and in increasing volume. They are not "novelties," but "necessities" to the many thousands of firms and persons who are using them on their daily production.

The economic conditions arising out of bloody and bloodless warfare have made these things essential to cope with competition. As wages increase, so must the "man-hours" per job be decreased to make the job pay. The domestic load is, we know, a most important factor in the power station,

but it is the industrial load which makes for the prosperity of the nation.

The biggest culprits in ignoring the vast possibilities of portable electrical industrial tools and appliances are the electricity supply authorities. Let us consider, for a moment, the wasted opportunities of housing schemes.

If the supply authorities made a point of running in their mains to the housing scheme sites *before* the foundations were got out, I believe that the labour costs of erection could be reduced by 50 or 60 per cent., by utilising electricity to speed up work that is at present done by hand. This would affect such operations as excavating; loading and unloading materials; concrete and mortar mixing; elevating materials to upper storeys; sawing, planing and sandpapering; cutting away walls, &c.; electrically melting plumbers' metal; soldering; screwing up woodwork; giving artificial light morning and night in winter time, to permit full working time or overtime; spray painting to supersede the old-fashioned brush methods; boring and drilling, and so on.

Electricity is used on building operations all over the States and Canada and many other of our go-ahead Colonies. It is also widely employed in London and various other cities. The supply *has* to be fed into the houses in any case, and it seems a great pity, therefore, that the supply authorities should miss such an opportunity to derive some revenue from their mains *before* the limited and less profitable domestic load is imposed.

We talked things over the other day with one of our leading building contractors who had displayed interest in our portable electric tools. He said that, as things were, these useful appliances could not be used *on the job*, as current was never available until the buildings were ready for occupation; so his employment of these tools was restricted to his workshop. When we suggested that he could overcome the lack of vision and enterprise of the supply authority by having portable generating plant, he at once gave us *carte blanche* to supply a generating set, on wheels, that he could ship from job to job on a lorry.

The moral is that this builder was so impressed with the value of portable electric tools from his limited experience in his workshop, that he was prepared to spend some hundreds of pounds to enable him to extend their use to the *job*.

The power undertakings, the wholesalers, and electrical contractors (especially the latter) must wake up to the possibilities of lightening labour, they must use their knowledge and endeavours to educate the tradesman to the use of portable electric tools, and not be content to sit behind their counter and wait for inquiries. They must *go out* and *make* the inquiries and *place the goods*.

The writer's experience is, that the average "man in the street" to-day (even the schoolboy) has a sounder technical knowledge than many of the self-styled electrical contractors, &c.

My parting advice to the electrical industry, as a whole, is: "Look to your laurels," and do not consider it beneath your dignity to read, mark and *learn* everything that you can possibly absorb on matters electrical, especially in relation to all things appertaining to *production*.

Therein lies one certain road to a healthier tone of the "profit and loss" account.

I shall only be too pleased to help all or any who are interested in the vital problem of applying electricity to profit in the workshop or on the job.

A. E. Long

Trade Mark Applications.

The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from February 23rd :—

L.E.C. (lettering and design). No. 474,577. Class 13. Electric junction boxes and casing for surface wiring.—Liverpool Electric Cable Co., Ltd.

Bonfix. No. 475,614. Class 13. Electrical junction boxes and fittings therefor.—Sefton-Fiddian Leage & Co., Bush Lane House, Cannon Street, E.C.4

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

ABRAM (Wigan).—Housing scheme (40), Bickershaw site, for the U.D.C.; surveyor.

AYRSHIRE.—New Town Hall at Largs, to cost £7,000; burgh surveyor.

BARNSLEY.—Two hotels, for the Barnsley Brewery Co., additional 163 houses, for the T.C.; borough engineer.

BASINGSTOKE.—Alterations, Mount Sanatorium; Hampshire C.C.

BATLEY.—Extensions to Technical College; Walter Hanstock and Son, Batley.

BEXLEY.—Additional housing scheme (230), for the U.D.C.; surveyor.

BLACKPOOL.—Central 'bus station near Talbot Road Station (to hold 500 'buses); borough engineer.

BO'NESS.—Joiners' and machine shops for Messrs. Thomson and Balfour, timber merchants; the manager.

BRISTOL.—Baptist Church (£10,000); for trustees, St. George's Baptist Church.

BURY ST. EDMUNDS.—Electric light installation, institution, for the B.G.; S. E. Day, borough electrical engineer.

CARLISLE.—Offices, Bank Street, for the Ocean Accident and Guarantee Corporation, Ltd.; H. E. Ayris, architect, 68, Lowther Street.

CHATHAM.—Extensions and electric lighting, Court House; Kent C.C.

CHERITON (Kent).—Kinema, for Bernard Miles, 113, Sandgate Road, Folkestone.

CHESTERFIELD.—Hotel (£15,000), Hollingwood, for the Chesterfield Brewery Co., Ltd.; Clayton & Rignall, architects.

CHESTER-LE-STREET.—Housing scheme (280); surveyor to U.D.C.

CLITHEROE.—Housing scheme (60); borough surveyor.

COVENTRY.—Extensions, Earlsdon Schools (£11,129), for the Borough E.C.; director of education.

COWLEY (Oxford).—Housing scheme (436), for Headington R.D.C.; W. Page Webb, architect, 23, High Street, New Headington, Oxford.

CROYDON.—Extension of postal sorting office, East Croydon; Office of Works. Billiard hall and shops, 89-99, High Street; Marcus Estates, Ltd. Showrooms and workshop, Leslie Park Road; Rees & Partners, 44, Park Lane.

DUKINFIELD.—Houses (44), for the T.C.; Marshall & Sons, builders, Ashton-under-Lyne.

DUNDEE.—Proposed conversion of Belmont Castle into Home of Rest (electric lighting); city engineer. New hotel, to cost £50,000 (electric light and radiators); secretary, Rock Villa Hotel, Ltd., Dundee.

EGHAM (Surrey).—Housing scheme (-10), for Mrs. Willson, president of the Women's Engineering Society.

ERITH.—Tuberculosis dispensary; Kent C.C.

GLASGOW.—Warehouses, shops, and offices at Renfield Street and Drury Street, for Upsons, Ltd., 7, Great Dover Street, London; the manager. New offices and addition to workshop at St. Rollox West Mineral Depôt; Fleming Bros., 65, Bath Street.

HAILSHAM (Sussex).—Additional 72 houses, for the R.D.C.; surveyor.

HALESOWEN.—Grammar school extensions (£20,000), for the governors; the clerk.

HILLINGDON.—Secondary school for Middlesex Education Committee; Mr. W. S. Try, of Cowley.

HULL.—Re-erection of factory, Wincolmlee, for Chambers and Fargus, oil cake manufacturers (several thousand pounds).

IRISH FREE STATE (Dublin).—Motor omnibus garage at Summerhill, for the Dublin United Tramways Co.

(Dundalk, Co. Louth).—Additions to railway station for the Great Northern Railway of Ireland; Engineer's Office, Amiens Street, Dublin.

KIRKBY-IN-ASHFIELD.—Housing scheme (68), The Park, for the U.D.C.; L. Dodsley, architect, Public Offices.

KIRTLINGTON (Oxford).—Cement works, for the Oxford and Shipton Cement Co., Ltd.

LEAMINGTON.—Sewage scheme (£88,000); borough engineer.

LEEDS.—Erection of Trustees' Hall at Bardsey, near Leeds; Eric Vernon Wimpenny, architect, Wood Garth, Bardsey, near Leeds.

LONDON (West Ham, E.).—Extensions to Fyfield Schools (£14,850), for the Borough E.C.; education architect.

(E.C.).—New buildings, 7 & 8, King Street, and 25-26, Ironmonger Lane; Mr. W. Waterhouse. Rebuilding part of 78, Upper Thames Street; Gunton & Gunton. Buildings at 97-99, Cheapside, and 31-33, Lawrence Lane; G. E. Wallis & Sons, Ltd.

(Islington, N.).—Extension scheme, Royal Free Hospital, Essex Road (£200,000); governors.

(Wood Green, N.).—Proposed secondary school, Hampton Road; Middlesex Education Committee.

(St. John's Wood, N.W.).—Park Road improvement scheme (£52,000); Marylebone borough engineer.

(St. Pancras, N.W.).—Building in Hampstead Road; Messrs. Carreras.

(Lewisham, S.E.).—Nurses' home for Board of Guardians; Douglas Matthews, Son & Ridley, architects.

(Kensington, S.W.).—Rebuilding premises in Ball Street and Young Street; John Barker & Co., Ltd. Reconstruction scheme, North Terrace and Thurloe Mews; Mr. F. G. Selby, architect.

(Westminster, S.W.).—Shops in Rochester Row; Messrs. Robertsons, Ltd., 217, Knightsbridge. New building for Odhams Press, 12-16, Wilson Street, Long Acre; Francis Chambers & Son. Tenements, Willow Street; city engineer.

(Brentford, W.).—Transformer house, Great West Road; C. & S. Construction Co. Extensions, Reynard Mills, Windmill Road; Messrs. Charles Fox, Ltd. Store and distributing station, Great West Road; Cement Marketing Co., Ltd.

MAIDSTONE.—Houses (82), for the T.C.; R. Corben & Son, builders.

MEREDIN.—100 houses, Castle Bromwich and elsewhere; R.D.C. surveyor.

NUNEATON.—Additional housing scheme (70 or 80), for the T.C.; borough surveyor.

OAKHILL (Staffs.).—Billiard hall and assembly rooms, Trentham Road; Beckett & Bloore, architects.

SALFORD.—Proposed exhibition hall, kinemas, skating rink, underground motor garage, &c., Cross Lane district, for a London syndicate (£1,000,000); city engineer.

SANDWICH.—Extensions, Grammar School; Kent Education Committee.

SEACOMBE (Liverpool).—Re-erection of Gandy Belt Works, Wheatland Lane, electrically equipped, for Messrs. Gandy (many thousand pounds).

SEAHAM HARBOUR.—Café, bakery and dance hall, North Railway Street; Messrs. W. & T. R. Milburn, for Messrs. Snowden Bros.

SMETHWICK.—Additional 108 houses, Warley, for the T.C.; Roland Fletcher, borough engineer.

SOUTHEND-ON-SEA.—Town hall and offices, for the T.C.; Professor Adshead, architect.

SURBITON.—Extensions to Council offices, with lighting and heating (£5,450), for the U.D.C.; surveyor.

SUTTON-IN-ASHFIELD.—Housing scheme (100), for the U.D.C.; Warner & Bocock, architects, Mansfield Road.

TAVISTOCK.—Sanatorium, Kelly College (approximately £5,000); headmaster of college.

TEDDINGTON.—Municipal buildings, for the U.D.C.; surveyor.

THORNTON HEATH.—Improvements, Infirmary, Mayday Road; Croydon Board of Guardians.

TRURO.—Additions to Museum buildings for the Royal Institution of Cornwall; Cowell, Drewitt & Wheatley, Mansion House, architects.

TYNEMOUTH.—Extensions, printing works, Charlotte Street; J. W. Moore, Ltd.

WIGAN.—Additional 108 houses, Gidlow site, for the T.C.; R. B. Donald, borough engineer.

WIRRAL (Cheshire).—Nurses' home for Wirral Board of Guardians; Finchett, Lancaster & Archer, architects, 13, Hoghton Street, Southport.

WISBECH.—Theatre, for H. Bancroft.

WORCESTER.—Houses (118), for the T.C.; G. Smith, builder, Birmingham.

WREXHAM.—Houses (54), Acton Park, for the T.C.; Francis Roberts & Son, builders, Acrefair.

The

Electrical Review

VOL. C. MARCH 11, 1927. No. 2,572.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

Industrial Psychology.

THE National Institute of Industrial Psychology, whose report for 1926 is briefly abstracted elsewhere in this issue, has now for six years been carrying on work which is constantly increasing in scope and importance. The president is the Earl of Balfour, K.G., and on the council are enrolled many men of the highest eminence in science, commerce, and industry.

It may seem strange that only in modern times has the importance of the study of the human mind attained to even partial recognition, although the injunction: "Know thyself!" is classic, and the aphorism: "The proper study of mankind is man" is almost proverbial. But the fact is that only in modern times has scientific method been brought to bear upon this subject, which is, moreover, one of exceptional difficulty owing to the impossibility of precise measurement of mental qualities and characteristics—and accurate measurement is the very soul of science. Nevertheless, during this century immense progress has been made, and experimental methods have been developed to a degree that enables conclusions to be reached with a large measure of certainty and to command the confidence of the onlooker. Almost as important as the examination of mentality is the subject of "motion study" in particular occupations; but the latter is rather a mechanical question relating to the body of the worker, and of general application, whilst the former relates to the characteristics of the individual mind without regard to its mortal shell—the contrast between physical and psychic.

"Industrial psychology" is a branch of the larger subject which is of extreme practical importance, for by its intelligent application, with the aid of motion study, the efficiency of the worker can be greatly improved, his happiness and comfort can be secured, and his remuneration economically increased whilst fatigue is minimised. All these factors are of great weight in these days when continuity of output and minimum cost of production are essential to cope with foreign competition, whilst continuity of employment and maximum remuneration are necessary to the maintenance of peace in industry.

We believe that the work of the Institute deserves the warm and practical support of every firm engaged in industry and of every social worker. The more

rapidly its operations can be extended, the sooner will they bear fruit. We are glad to see that it is gaining in appreciation and that its resources are growing; but still its work is conducted on a scale absurdly small in comparison with the vast and fertile field that awaits the tilling, and we hope that donations and subscriptions will flow into its funds at an ever-increasing rate. It should be remembered, too, that its experts are at the service of those who seek advice on the reorganisation of their manufacturing processes, the staffing of their works, and the improvement of working conditions, at moderate fees. It is incorporated as a scientific association not for profit; in its own way it fills a similar position to the National Physical Laboratory, and in due time we hope to see a National Psychology Laboratory come into existence.

Aerial Navigation Lights.

Illuminating engineers have been much concerned with the best methods of lighting streets, the dominant consideration nowadays being the safe guidance of traffic, and for many years the design of coast and ships' lights has been a specialised subject, but in the present century the new problem of lighting the "highways of the air" has arisen. An interesting review of recent work in this field was presented in a paper recently read by Mr. H. N. Green before the Illuminating Engineering Society. The author confined himself to aerodrome lights, but this in itself is now quite a big subject. Considerable ingenuity has been expended on the lighting of landing places, the design of beacons, the arrangement of boundary-lights, &c., and many different forms of lamps are being pressed into service. In remote spots where electricity is not available, acetylene is commonly used for beacons, but the flexibility of electric lighting is well illustrated by the diversity of appliances used. It is common knowledge that electric gasfilled lamps of very high power have been employed for this work, but in many districts the neon light, owing to its unmistakable colour and capacity for quick-flashing, is even more useful. The neon beacon at the Croydon Aerodrome seems to have proved signally successful, and the installation of neon tubes to mark out the landing area is also under consideration. Mr. Green devoted a section of his paper to the problem of flying in fog. At present, pilots do not attempt flight when the visibility is unduly low, but they may be unexpectedly caught in dense fog, or mist. In this case other electrical devices, such as the "leader cable" and directional wireless, come to their aid.

Faults in Flexibles.

In view of the rapid increase in the use of portable electrical appliances in the household, it is surprising that no progress is made towards eliminating a trouble which, though no great matter in itself, must prove irksome to the non-technical persons who constitute the vast majority of users—namely, breakdown of the flexible leads, which happens all too often.

Within our own experience, with a variety of portable apparatus, the faults have been confined entirely to the parts of the flexible subject to frequent bending—*e.g.*, where they are attached to plugs, fires, &c.—and are mainly due to fatigue of the fine stranded wires, resulting in brittleness and eventual fracture, or short circuit due to the broken ends. The inclusion of three steel wires in the strands mentioned by a correspondent some time ago should be beneficial, not, we think, on the score of strength, with which we have no fault to find, but because their relative stiffness prevents the flex from bending at so sharp an angle, and thus distributes the distress over a greater length of the flex.

Material improvement might easily be effected in the same direction by easing the curvature of the entry into plugs, &c. In some cases apparently no thought has been given to the matter at all; the flex enters and is tightly clamped in a hole with sharp edges, concentrating the distress on a length of, say, a quarter of an inch, and inviting early trouble. By attention to such points we have found it easy to reduce faults in flexibles to a trifling number; and faults of other descriptions are rare indeed. Incidentally, stout flexible with plenty of cotton lapping is more durable than thin stuff.

The education of the housewife in effecting simple repairs of this kind, which is one of the aims of the Electrical Association for Women, is a very laudable purpose; but prevention still remains better than cure, and this is a weak point to which, we think, manufacturers might with advantage devote much more attention than they do.

The Truth About Electric Cooking.

In its latest publication (E.D.A.661) the British Electrical Development Association rebuts some rather absurd accusations which have been made against electric ovens as used by bakers and confectioners. For instance, a periodical supporting gas interests recently alleged that there was a movement among Swiss users of electric baking ovens to revert to gas owing to the production of ozone by the elements, which flavoured the food. It is pointed out that a glowing element cannot possibly generate ozone, apart from the fact that in all up-to-date ovens the elements are totally enclosed. The Association quotes a letter to the Electrical Review from a firm of bakers in which the "ozone" *canard* is ridiculed. Further evidence is a statement by the Association of Swiss Master Bakers and Confectioners (representing 5,300 bakers out of a total of 6,000) to the effect that in Zurich alone 30 per cent. of the ovens are electric, and that in 15 years' time 4,000 ovens out of 6,000 in use in Switzerland will be electrified. But perhaps this Association has not yet heard of the "movement" before-mentioned; nor, apparently, have the Swiss supply authorities. Is it possible that the "movement" originated in the befumed imagination of a gas enthusiast? And does this enthusiast want it both ways: non-ventilating electric fires and ventilating electric ovens?

The Birmingham Frequency Problem.

In our "Notes" to-day we reproduce an interesting statement from the *Birmingham Post*, from which it will be seen that the new power station which the Corporation of Birmingham is about to erect is to contain generating plant of 25 cycles frequency. We do not wish to read into this announcement more than is justified; but it is undoubtedly of great significance.

It has been repeatedly emphasised, in and out of Parliament, that if the frequency is to be standardised, the change must be made at the earliest possible moment; the longer it is delayed, the higher will be the cost. The erection of a new power station of capital importance with a frequency of 25 cycles implies that the change in the Birmingham area is indefinitely postponed. Mr. R. A. Chattock and his Committee are to be congratulated on carrying their point—that to spend millions on the conversion would be a waste of money—and we have no doubt that their worries are immensely lightened by this decision.

The suggestion that when the plant attains the end of its economic life it will be an inexpensive matter to replace it with machines of the standard frequency is beside the point. The real difficulty of conversion is met not in the power station, but in the distribution system and on consumers' premises—a very different matter.

As precedent is of great influence in public affairs, we may safely conclude that while the many minor examples of non-standard frequency may undergo standardisation, the big systems operating at 25 and 40 cycles will be left in peace for a time.

Theatre Lighting.

The new complete electric-lighting installation for both the auditorium and stage at the Alhambra Theatre, London, involves some novel features in the remote control of the auditorium lighting from the stage.

THE recent completion of the new stage-lighting installation at the Alhambra Theatre, London, was the final stage of a scheme for rewiring the whole of the building which was commenced a few years back. The old installation, 100-V, 3-wire, was considerably out of balance, and the way in which the old wiring was run rendered it impracticable to effect a reasonable balance of the load. It was equally impracticable to change over the old work on to the outers at 200 V, as the existing wiring was too old to stand the higher pressure, and no intermission of performances and rehearsals could be entertained. It was therefore decided to install modern systems at 200 V, involving the use of high c.p. units for both the auditorium and the stage.

Three main lighting groups serve for the general lighting of the auditorium. Two of these consist of fittings fixed in alternative positions over the seats on the various tiers, and are supplied from entirely independent intake mains housed in separate fireproof chambers at the front of the house (Leicester Square). The third lighting group is made up of decorative totally-enclosed hexagon opal fittings arranged in front of the tiers. By suitable dimming arrangements, very effective lighting is obtained, and with the whole lighting "on," the result is particularly pleasing; some idea of this may be gained from fig. 1.

Although the third lighting group is also supplied from the front of the house, it is controlled for switching and dimming from the stage, the equipment involving some novel features. In order to overcome the difficulty brought about by the L.C.C. Regulation prohibiting circuits from the auditorium passing through the proscenium wall, an ingenious system of electro-mechanical operation has been adopted. The dimming apparatus, designed by the Watford Electric and Mfg. Co., Ltd., and involving the movement of a metal arm for short-circuiting, or otherwise, a number of carbon resistance brushes, is operated by specially designed switches, the essential movements of which are rigidly attached to, but insulated from, the armatures of plunger relays operated from the stage. Fig. 2 shows the remote-control relay switches, the relay and switch portions of which are wholly and separately enclosed. Fig. 3 shows the Watford dimming equipment. The speed with which the resistance is either inserted or withdrawn is adjustable by means of an eddy-current disk brake. Pilot lamps to the circuits remotely controlled from the stage are fixed in an iron box, with a glass cover, let into the proscenium wall in a convenient position for the switchboard operator. In addition to the stage control, two-way and intermediate switching for the third group is provided on the auditoroum ground floor, from where it can at any time be switched on full in a case of emergency.

The dimmers for the general-lighting groups are so arranged that normally the lamps are at about half-light, thus leaving sufficient illumination in the auditorium during performances for the lighting of the gangways. Additional switches provide for further resistance during kinematograph trade shows, when a greater degree of darkening of the auditorium is required. The decorative lighting is dimmed right out while the performance turns are on.

Fig. 1.—Alhambra Auditorium Lighting.

The L.C.C.'s approval is required when it is desired to light any part of the auditorium by the stage current, and the only fitting which is supplied in this way is the large centre fitting suspended from the dome. It is interesting to note that this "Sun Burner," fig. 4, is an old converted gas fitting, and is now equipped with eight 1,000-W gasfilled lamps.

For circulation and cleaning during the day, certain places, such as the staircases and exits, require artificial light, and a group of pilot and exit lights is separately wired and switched for these positions.

Another group provides for other positions where artificial light is only wanted on dark days, the lamps being separately wired and switched as sub-pilots. As it is essential that during performances there should be no possibility of these lights being left out, special switching arrangements are provided. An emergency switch also permits the sub-pilots to be used when required during the day. The exit and pilot lights are wired up to two-way and intermediate switches so that they can be controlled from the stage door and all floors of the auditorium. A large number of lights are

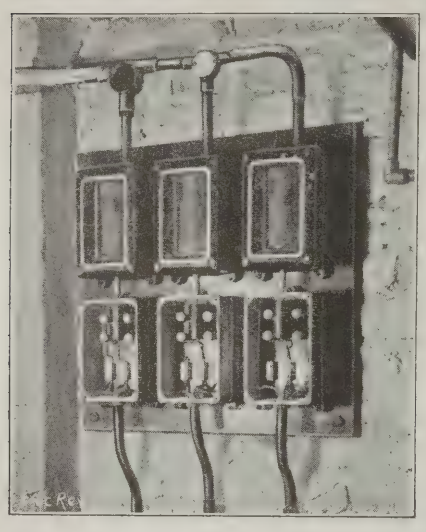

Fig. 2.—Remote Control Relay-Switches.

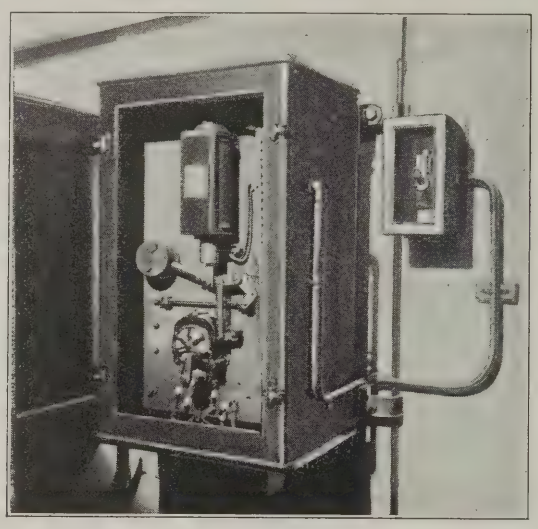

Fig. 3.—Light-Dimming Apparatus.

also provided in the basement, and a separate circuit serves for power and heating. In addition, an entirely separate supply cable serves for lighting and heating in the dressing rooms, boiler house, and workshops. The new auditorium scheme embraces some 258 points and a total loading of 25 kW, as against 550 points and 35 kW in the old installation. The wiring is run in screwed conduit throughout.

For the stage lighting, battens of the magazine type have been employed, replacing many of the open type previously in use, and the resulting improvement in illumination and in the attractive colour effects now obtainable is most marked. The battens are of a special design to secure strength, rigidity, and durability, and employ specially constructed wiring troughs to give easy access to the wiring and lampholders. It is interesting to note that the wiring for the battens is taken right up to the grid and not to the flies, thus affording greater clearance and means of access. All the branch circuits from the control board to the battens are brought to ironclad connection boxes on the grid. These serve as link boxes only, one to each batten, and are designed along the lines of the P.O. telephone link boxes.

The loading of the battens and float is 46 kW. The main battens are 42 ft. long, each carrying 33 white lamps, 17 reds, 17 blues, 16 ambers, and 1 pilot. An additional batten about to be added at the back of the stage is specially designed for tilting, so as to throw the light either in front of or behind a scenic drop. This will bring the total loading of the battens and float up to 52 kW.

Arrangements are made by the provision of a main change-over switch and links, so that in the event of the supply failing on the Charing Cross Electric Supply Co.'s theatre main, current can be quickly obtained from the company's network main.

The relative merits of metallic and liquid resistance dimmers had to be considered in respect of the space available, the provision and ventilation of a fireproof chamber, regulating capacity and cost. It was found that to meet the conditions of limited space and the very fine grading necessary, metallic dimmers would be much more costly than liquid ones, and the latter were decided upon. A few metallic dimmers are, however, used for groups of lights which are regulated "right out" or "right in," as required, without check. The liquid dimmers and arc resistances are housed in a specially constructed fireproof chamber two floors below the stage. Very great difficulties were encountered in conveying the large number of tracker wires from the dimmer regulators on the control gallery to the pots, and the highly satisfactory manner in which these have been overcome is evidenced by the ease with which the regulators are operated. Every dimming circuit has a pilot lamp arranged above the regulating wheel, indicating to the operator the degree of dimming.

The switchboard for the stage installation, which is arranged on a specially constructed control gallery above the stage floor, is in three sections, the operating board, the fuseboard, and the return board. The whole of the fuses for the stage lighting are brought to the middle section, fig. 5 right, thus avoiding the great inconvenience previously experienced by fuses being situated in remote and inconvenient positions. The fuses for any section are clearly indicated and can be easily and quickly identified for replacement, resulting in great economy of time over what was previously possible.

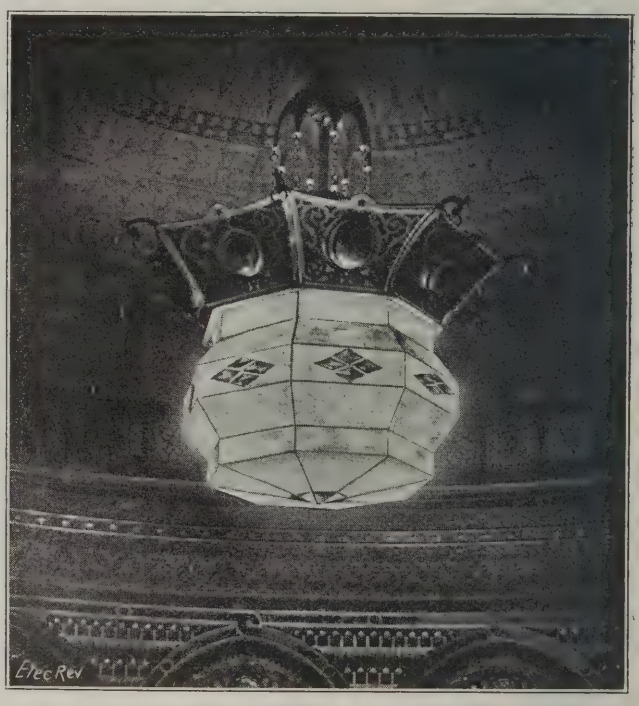

Fig. 4.—Auditorium Fitting, 8,000 c.p.

The operating board, fig. 5 left, is arranged on the negative or earthed side of the system, thereby minimising the risk of accidental shock to the operator. A s.p. knife switch, in addition to a link fuse for each circuit, is provided on this board. On the positive or return board, fig. 6, are installed electrically operated contactors. These are governed by ordinary s.p. tumbler switches on the operating board, the system being arranged so that a master switch and contactor may be operated to put the whole of the lighting "on" or "off" circuit. The necessary

equipment for operating the dimmers is accommodated by a separate board facing the main operating switchgear; the end of this is shown in fig. 5. Pilot lights for the various circuits are arranged over the dimmer controls so that the lighting effect may be observed by the operator.

Fig. 5.—Operating Switchboard.

Fig. 6.—Positive Switchboard.

It may be of interest to record that over 25 miles of wire was used on the stage installation.

The whole of the reconstruction work was carried out without a single interruption in the usual programme of three performances daily and morning rehearsals, and the final change-over to the new 200-V system was made without a hitch of any kind.

The whole of the electrical work in both the auditorium and the stage installations was carried out to the plans and specifications of the consulting engineer, Mr. H. D. Wilkinson, M.I.E.E., to whom we are indebted for permission to view the apparatus, and much of the detail work in connection with the stage installation was developed by Mr. Wilkinson's colleague, Mr. P. S. Tasker. The contractors for the auditorium scheme were Messrs. Duncan Watson & Co., Ltd., and for the stage work Messrs. Tyler & Freeman.

Agricultural Electrical Machinery.

A comparative review of the exhibits at the 1927 Paris Agricultural Exhibition with those of previous years, and machines employed in other countries, depicting some items of special interest to engineers at home.

By R. BORLASE MATTHEWS, Wh.Ex., A.M.Inst.C.E., M.I.E.E., F.R.Ae.S.

(*Concluded from page* 333.)

There was one rather complicated-looking portable agricultural motor, the "Record." Incorporated with this machine is a pump, a circular saw (with a sliding table), and a train of gears with four projecting spindles which provide successively lower speeds for any pulley that may be placed on any one of them. A special winch pulley is provided for the last spindle, so that a rope may be wound round it for haulage purposes, like a crab winch. Altogether this equipment gives a choice of speeds of 50, 75, 100, 150, 200, 400, 600, and 800 r.p.m.

An improvement in the construction of the lighter portable motors is the provision of both stretcher handles and two wheels. The framing is usually so arranged that when it is set down upon its four supporting feet the wheels are just off the ground, which naturally improves the stability of the machine. French manufacturers do not yet seem to have grasped the importance of advocating drip-proof or protected motors for farm use, as is the general practice in Germany and Scandinavia. A tough-rubber-sheathed cable was employed generally for the portable motors. In one case, that of the Thomson-Houston Co., the cable was protected with a leather covering.

Most of the portable motors were provided with cable reels; from these the motors are temporarily disconnected while the cable is paid out to the required length. A plug on a short lead connected to the motor is then placed into a receptacle on the side of the cable drum to which the inner end of the cable is connected. Three-pin plugs are generally employed, with a central earthing pin.

For some time it has been the practice to fix the motor starters directly on to the motors intended for agricultural use. A detail improvement that was noticed was that the starters for the larger "Law" machines were built with curved casings, so that they might be fitted in any position on the cylindrical carcase of the motor. Several firms are now manufacturing a portable platform on which any standard electric motor can be fixed. This is fitted with barrow wheels and also tubular stretcher handles. Above or alongside the motor a shaft fitted with five pulleys of different diameters is mounted (on a pair of A frames, in the case of overhead pulleys).

Legendre Frères showed a portable motor without a chassis, fitted with two convenient carrying handles and a worm reduction gear. The spindle of the worm

wheel was connected to a flexible shaft, the latter being directly attached to the machine to be driven.

While French manufacturers are at present concentrating on the portable wheel-barrow type of farm motor, it should be borne in mind that Germany and Scandinavia have passed through this phase. Nowadays, in those regions, it is becoming the common practice to employ a large number of individual motors. This means more capital invested in motors, but less

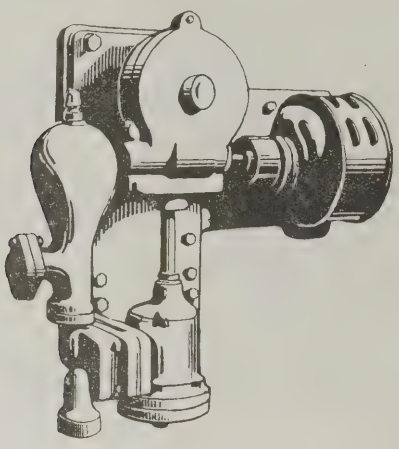

Fig. 9.—Electric Deep-Well Pump.

time wasted in adjusting portable machines and, after all, it is in the total cost per annum that the farmer is interested.

A very compact ball-bearing "Dupuis" threshing machine, which only requires a 3-h.p. electric motor to drive it, was on view. Generally, there were not so many electrically driven threshing machines shown this year.

Several milking machines were exhibited, though there was nothing new, except the "Delort" portable electric vacuum pump, which was mounted under a cover on a truck. One of the "Hinman" portable electric vacuum pumps was also shown. This is new to Europe, though it has been used in America for some time. Both these pumps appeal to the tenant farmer, for they avoid the erecting of permanent piping and shafting in the cow byres.

Most of the electrically driven cream separators were operated by a round belt drive, kept at the correct tension by a jockey pulley. However, the "Persoons" electrically driven separator had the motor directly connected. The machine was also arranged to drive a churn by means of an extensible tubular shaft. In the case of the "Melotte" directly driven electrical separator, a pulley was also fitted to drive a churn by means of a flat belt. Undoubtedly the directly connected electric drive will eventually become the standard, as it is difficult to keep the machines so clean when they have exposed belt drives, apart from the slight danger to the fingers in the use of such a drive.

Saw benches with bascule or tilting tables are still very popular. They are certainly most convenient, for logs can be sawn very much more easily and safely in a swinging V-shaped holder than on a table; yet for other work a table is imperative.

Two windmill electric generators were displayed, but there was no special novelty in their construction. The interest lay rather in the fact that evidently Frenchmen are toying with this method of "getting current for nothing."

A large range of electrically operated water pumps was shown. The high-pressure form is apparently rapidly coming into favour. A number of interesting types of deep-well pumps were on view, in particular the "Japy," a very neat design, fig. 9. The great majority of these pumps only employ fractional horse-power motors, as they depend upon the volume pumped by working steadily nearly all through the twenty-four hours of the day.

The Société Générale Agricole showed a very neat mercury-cum-weight gravity-control mechanism for stopping and starting a pump motor according to the water level. The same firm also exhibited an ingenious wood-turning lathe. This consisted of a standard breast drill arranged for clamping on a turned rod, the latter serving as the lathe bed. Several ingenious attachments result in its becoming an almost universal lathe, a circular saw bench, or various drilling devices.

The French farmer's wife is a confirmed user of washing machines. These are of a very simple character, consisting of a perforated galvanised drum, which is revolved, first one way and then the other, in a bath, fitted with a cover, fig. 10. The bath is usually heated with a charcoal, wood, or coke fire. Several new electric drives were on view this year. The difficulty to be overcome is that a considerable reduction in speed is required, coupled with a reversal of the washing drum, every few revolutions. The price of a complete electrically driven machine, without a wringer, but including the stove, is about £20. These machines are of much rougher finish than the American type that is usual on the British market; however, the first cost is very much less—about one-half.

In conclusion, it may be remarked that the exhibition gave an indication of a considerable advance in general agricultural machinery and also in the electric driving of the same. Undoubtedly attention will soon

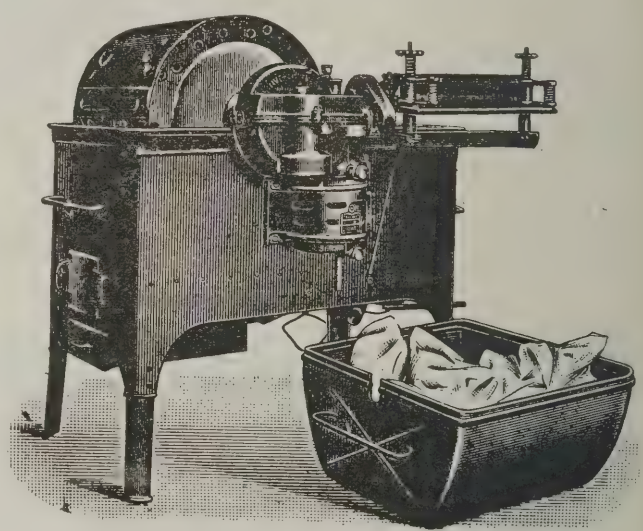

Fig. 10.—A French Electric Washer.

be paid to the design of farm machinery so that it will operate at a few selected speeds (as has already been done in Germany) that best suit motor driving and reduce the number of speed reductions required. The exhibition as a whole was certainly of a most interesting character.

Electro-Farming.

The paper on this subject which was read by Mr. R. Borlase Matthews before the I.E.E. in London last year has since been given at 11 Centres and Sub-Centres, with stereoscopic lantern slides and kinematograph films. On each occasion the contents were brought up to date. At Cardiff, on February 22nd, the paper was discussed at a joint meeting of the Western Centre and the South Wales Institute of Engineers; in the discussion Sir Iltydd Thomas stated that a considerable number of Welsh farmers near Cardiff were taking a supply of electricity from the South Wales Power Co. At Swansea, on the following day, when the lecture was repeated, Mr. C. T. Allan described his successful experiments with electro-culture at Llantwit Fadre, and Mr. Percy Player, who stated that he had used electricity on his farm near Swansea for 20 years, emphasised the necessity of adopting electric ploughing.

Sag Calculations for Power Transmission Lines.

A consideration of the requirements for Overhead Conductors under varying working conditions due to changes in temperature, wind pressure, ice covering, &c.

By WILLIAM T. TAYLOR, M.Inst.C.E., M.I.E.E.

(*Concluded from page* 336.)

For the determination of sags and tensions under the different temperature and loading conditions, L_o and L_t are the desired lengths required. The desired sag values D_1 and D_t are given in Table V. These values have been "rounded off" to the first decimal point, and are well within practical accuracy—more so than the possible inaccuracies of *constants* often used, and those inaccuracies made by the man in overalls (the lineman).

Example.—Suppose a 0.10 sq. in. (0.357 in. diam.) bare hard-drawn solid copper conductor is to be erected on a 400-ft. span in such a way that the tension (when loaded to the British Electricity Commissioners' specified loading) shall not exceed 26,550 lb./sq. in. at +22 deg. F., and let it be desired to find the sag and tension for:—

(1) Conductor at +22 deg. F. with ice and wind, as specified by the E.C.;
(2) conductor at 0 deg. F. with ice and wind, as specified by the E.C.;
(3) conductor in still air at 60 deg. F.;
(4) conductor in still air at 100 deg. F.;
(5) conductor in still air at 120 deg. F.

Constants.—$A = 0.10$ sq. in., $D = 0.357$ in., $d = 0.5$ in., $w = 0.386$ lb., $w_{11} = 0.917$ lb., $w_{111} = 0.905$ lb., $W = 1.288$ lb., $E = 18{,}000{,}000$ lb./sq. in., $\alpha = 0.0000093$ per deg. F., $P = 2{,}655$ lb., $l = 400$ ft.

Then, in terms of the allowable tension P, the sag for conductor at datum deg. F. with half an inch radial ice coating and 8 lb. wind at right angles to the line, from the general equation, is—

$$D = 400^2 \times 1{\cdot}288 \;\; 8 \times 2{,}655 = 9{\cdot}7 \text{ ft.}$$

(*see Table II*)

and the length of conductor under this condition is—

$$L = 400 + 8 \times 9{\cdot}7^2 / 3 \times 400 = 400{\cdot}63 \text{ ft.}$$

(*see Table III*)

but the length when all tension has been removed is—

$$L_o = 400{\cdot}63 \;\; (1 + 2{,}655 / {\cdot}10 \times 18{,}000{,}000) = 400{\cdot}04 \text{ ft.}$$

(*see Table IV*)

and, under this condition, for a rise in temperature of 100° F., the length of conductor in the span is—

$$L = 400{\cdot}04 \; (1 + {\cdot}0000093 \times 100) = 400{\cdot}42 \text{ ft.}$$

Hence, by simplifying and transposing the lengths, for the bare conductor in still air, we have—

$$3 \times 400{\cdot}42 \times 400^3 \times {\cdot}386 \;\; 64 \times {\cdot}10 \times 18{,}000{,}000 = 257{\cdot}6,$$

and

$$D_t^3 - \tfrac{3}{8} \times 400 \; (400{\cdot}42 - 400) \; D_t = D_t^3 - 63 \; D_t$$

or

$$(D_t^3 - 63 \; D_t) - 257{\cdot}6 = 0$$

$$D_t = 9{\cdot}46 \text{ ft.} \qquad (\textit{see Table V})$$

and the corresponding tension is—

$$P_t = 400^2 \times {\cdot}386 / 8 \times 9{\cdot}46 = 814 \text{ lb.}$$

For the different temperature and loading conditions we have the following data:—

Loaded, at 22° F.		—	Temperature without ice and wind loads.			
			0° F.	60° F.	100° F.	120° F.
L_1	400·12	L_t	400·04	400·27	400·42	400·49
$\frac{3 l^3 W L_1}{64 AE}$	859	$\frac{3 l^3 w L_t}{64 AE}$	257·36	257·5	257·6	257·65
$D_1^3 - \frac{3}{8} l (L_1 - l) D_1$	$D_1^3 - 18{\cdot}3 \; D_1$	$D_t^3 - \frac{3}{8} l (L_t - l) D_t$	$D_t^3 - 6 \; D_t$	$D_t^3 - 40{\cdot}5 \; D_t$	$D_t^3 - 63 \; D_t$	$D_t^3 - 73{\cdot}5 \; D_t$
D_1	10·15	D_t	6·7	8·41	9·46	9·94
P_1	2,538	P_t	1,150	907	814	776

That is—	(*Tension in lb.*) P	(*Sag in Feet.*) D_r	D_v
At zero °F. with ice and wind loads	2,655	9·7	6·9
At 22° F. with ice and wind loads	2,538	10·15	7·2
At zero °F. without ice and wind loads	1,150	—	6·7
At 60° F. without ice and wind loads	907	—	8·41
At 100° F. without ice and wind loads	814	—	9·46
At 120° F. without ice and wind loads	776	—	9·94

(D_r = plane of resultant; D_v = vertical plane); *see column 11, Table I.*

NOTE:—We thus see that, for this example, the maximum effective (*vertical*) sag occurs at the highest temperature.

TABLE V.—Sag Span Values at different Temperatures and Loadings for Hard-drawn Solid Copper Conductors.

Calculated from the parabolic equation— $[D^3 - \frac{3}{8} l (L_1 - l) D] - 3 L_1 l^3 W/64 AE = 0$ *for 22° F.*

and

$[D^3 - \frac{3}{8} l (L_t - l) D] - 3 I_t w/64 AE = 0$ *for other temperatures.*

A.	t	Span in Feet = l.

Improved Electric Tramcars.

Two new cars built for experimental service on the North London system of the Metropolitan Electric Tramways, Ltd., their features being light weight, high acceleration, smooth running and comfort.

FOR some considerable time close attention has been devoted by the tramway companies associated with the London "Underground" group to the improvement of car design. On the system of the London United Tramways, Ltd., 70 cars have been equipped with modern light-weight motors having specially designed characteristics for rapid acceleration, and 110 cars with improved brakes; 45 cars of the Metropolitan Electric Tramways, Ltd., are now being fitted with new motors, which are an advance on even those of the L.U.T., Ltd. In addition, a number of cars have been fitted with specially well sprung moquette-covered transverse seats, and the interiors of the cars have been repainted and provided with white ceilings, which, together with improved lighting, has added to the attractiveness of the service afforded.

Fig. 1.—New M.E.T. Electric Tramcar.

It is interesting to note that this example has been followed by other London and provincial undertakings, whilst a questionnaire, by means of leaflets in the cars asking for opinions or suggestions, resulted in many thousands of replies being received, indicating public approval and appreciation.

To obtain full advantage of further improvements, the M.E.T., Ltd., has designed and built at its Hendon works a new car known as "The Bluebell," and to exclude any influence of conventions of existing tramcar design, the interesting step was taken of asking the London General Omnibus Co. to design and build a tramcar body at its Chiswick works. The design was based on comfort, even at the expense of reducing the carrying capacity, and the experience gained with the new cars should be of considerable value.

The M.E.T. "Bluebell."

This car's leading features, in comparison with the existing standard type of double-deck top-covered car, with cross seating, are set out in Table I.

The body is of light-weight construction, composed chiefly of steel channel filled with wood (ash); the platforms used by passengers are level with the main floor of the car, only the driver's compartment being at a lower level, and there are only two steps between the ground and the body floor (the same number as on N.S.-type omnibuses). The staircases have been designed to allow of passengers alighting at the front end whilst others are boarding at the rear end, thus avoiding obstruction. The interior is as free as possible from all mouldings or corners liable to collect dirt, and stainless steel is used for all hand railing and hand-grip stanchions. In the top saloon, each window opens by vertical slide of the balanced type operated individually by passengers.

Transverse moquette-covered seats are fited in the lower saloon with short longitudinal seats at each end in order to provide for standing passengers without obstruction, and a considerable area of platform is available for the same purpose. In the top saloon, transverse spring seats covered with a leather substitute are fitted; the flooring in the lower saloon is of grey rubber.

Built by M.E.T., Ltd. Built by L.G.O. Co.

Figs. 2 and 3.—Front Views of New Cars.

Table I.—The M.E.T. Car.

	New car.	Existing type.
Length over buffers ...	36 ft. 4 in.	34 ft. 8 in.
Maximum width ...	7 ft.	7 ft.
Width inside lower saloon	6 ft. 4 in.	6 ft. 0½ in.
Height, lower saloon ...	6 ft. 3 in.	6 ft. 0½ in.
Height overall from rail	15 ft. 2 in.	15 ft. 5¾ in.
Height of car floor from rail	2 ft. 5 in.	2 ft. 9½ in.
Weight of body with equipment	6 tons	10 tons 11 cwt.
Total weight unloaded ...	12 tons 5 cwt.	16 tons 11 cwt.
Seating capacity, lower saloon	27	27
Seating capacity, upper saloon	44	46
Total carrying capacity, including standing ...	105	85

The driver stands in an enclosed partition with semi-vestibule front, mirrors being situated so as to give him a clear view of the front and rear doorways.

The electrical control is on the contactor system with master controllers and interlocks, of the B.T.-H. Co.'s make, the contactor gear being situated in a convenient compartment on the platform. Air brakes acting on the track and wheels, with emergency cocks at each end of the car for use by conductor or passengers in case of need, act in conjunction with air-blast sanders, and hand brakes are also fitted, operated by a wheel in the motorman's cabin.

The trucks are of the low-wheel bogie type, the driving wheels being 28 in. in diameter instead of the usual 31¾ in. All axle boxes are equipped with roller bearings and the motor armature shafts with ball and roller bearings. The motors are of light weight, rated at 50 h.p. each, two motors being fitted; they weigh 35 lb. per rated h.p., compared with 56 lb. for the older motors, and they give smooth and rapid acceleration, taking full advantage of their large overload capacity.

Folding doors and steps working in unison at each entrance are operated by the motorman manually through a system of ball-bearing rods and levers. Special attention has been given to lighting, which is carried out by means of opal-glass bulbs in suitable fittings. The lighting switches and fuses are enclosed in a small cupboard, and headlights are fitted with special reflectors designed to be effective in foggy weather.

The L.G.O.C. Car.

The car built by the London General Omnibus Co. was at attempt to evolve a tramcar on modern omnibus practice. In many respects it is similar to the vehicle described above, so that only those features wherein it differs will be mentioned. Some of its main dimensions are shown in Table II. The electrical controller is of the camshaft type acting in combination with a line switch, of the Metropolitan-Vickers make. Brakes, sanders, trucks, and motors (though of different make) are identical.

Table II.—The L.G.O.C. Car.

Length over buffers	36 ft. 0 in.
Width, lower deck	6 ft. 9 in.
Height	14 ft. 10 in.
Width of main door openings	3 ft. 10 in.
Width of emergency door openings	1 ft. 6½ in.
Number of seats, lower deck	28
Number of seats, upper deck	36
Total weight, unladen ...	12 tons

All vertical pillars are ash, with steel flitches of 14 S.W.G. inserted, gusseted to the main chassis frame, which is a Z section pressing of nickel steel. The body in its entirety is carried upon this chassis frame.

The motorman's compartment is totally separated from the main lower saloon by a sliding door, but not enclosed. The controls are within easy reach, and include a Peters air brake valve and a Peacock emergency hand-brake lever.

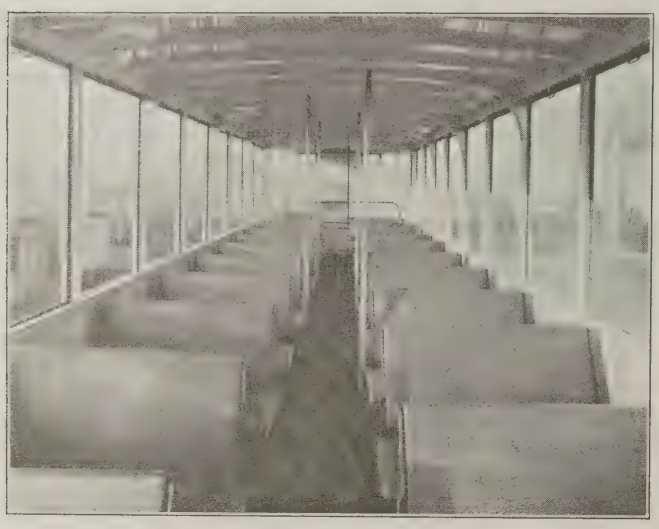

Fig. 4.—Upper Deck, M.E.T. Car.

Fig. 5.—Upper Deck, L.G.O.C. Car.

Double sliding windows are fitted in the upper saloon, provision having been made for excluding draughts when travelling in either direction. A light aluminium metal domed roof is incorporated, reinforced with a steel structure in the centre for carrying the trolley pole collector; trap doors and a "cat walk" are also fitted.

Semi-bucket seats are arranged transversely and longitudinally, the seats and backs being spring filled and upholstered in moquette.

For interior lighting small white opaque bulbs are employed in conjunction with white reflectors. The interior paint is white enamel, and electric bell pushes are fitted at regular intervals.

Two double folding doors form the main entrances, with two small doorways at the other corners for use in emergency, the normal operation being to board and alight at the rear end as in the case of ordinary cars. Steps of a very ingenious design, operated by a removable lever, have been devised to serve two purposes: not only does the step tread rise into a vertical position when folded so as to prevent "hangers on" when the door is closed, but the vertical riser of the steps moves to a horizontal position in order to close the open floor space (when the door is closed) and serves as a portion of the platform.

London Transport.

Report of the London and Home Counties Traffic Advisory Committee.

LAST week the report of the Advisory Committee on the inquiry held in October, 1926, with respect to the travelling facilities to and from South-East London, was issued (H.M. Stationery Office, price 1s. net).

The area concerned comprises seven Metropolitan boroughs, covering 27,934 acres, with a population of 1,098,621 in 1921, when 250,000 persons had to travel into or out of the area every day. A map is included, showing the railways and tramway and omnibus routes in the area; all but one of the railway lines are now electric, there being 140 miles of surface electric railway in the area, and 48 stations. Only 1½ miles of underground "Tube" electric railway is included in the seven boroughs. The L.C.C. electric tramways operate along 46½ miles of street, and 1,492 omnibuses are in service.

During the war nine railway stations were permanently closed, and owing to the competition of tramways and omnibuses the company held that there was little demand for railway facilities within about four miles of Charing Cross. Complaints of overcrowding at rush hours were made, with especial reference to London Bridge station. The local authorities urged the need for new tube railways in the area.

The Committee concludes that main-line trains should not stop at stations within three miles of their termini, except at junctions. The congestion at rush hours has increased since the war owing to changed conditions of employment, resulting in the majority of workers starting and stopping work at about the same time. The electrification of the suburban lines has helped, and will further help, to relieve the situation, and the action of the Southern Railway Company is warmly commended; the consideration of additional underground railways should be deferred until the Company's plans are completed, but the extension of the Bakerloo line in a south-easterly direction is worthy of examination. Fares should be regulated by co-operative action in such a way as to attract long-distance passengers to the railways. Owing to the existing congestion in the northern part of the area, no addition should be made to the numbers of tramcars and omnibuses operating there. The question of linking the East London Railway with the Southern Railway, to enable through trains to be run between the Metropolitan and Southern Railways, should be immediately considered; this would necessitate the provision of a fly-over junction between Whitechapel Junction and Aldgate, recommended in the Committee's report on travelling facilities to and from East London, which would effect a great improvement.

Finally, the Committee again emphasises the necessity for bringing all forms of public passenger transport in London under unified control; inquiries with this end in view are being made by a sub-committee.

The report is accompanied by a number of appendices giving statistics, fares, &c.

The Brazilian Market.

Commercial Secretary's Report.

A report upon the economic and financial conditions in Brazil (dated October, 1926) has been forwarded to the Department of Overseas Trade by Mr. E. Hambloch, Commercial Secretary at Rio de Janeiro (Stationery Office, 1s. 6d. net). In the course of a general survey, Mr. Hambloch says that guerilla warfare, restriction of capital, a sudden rise in the exchange, and a number of other causes combined to make the year ended September last an uneasy one for commercial circles. The position is, however, not viewed pessimistically, for Brazil has great recuperative powers and its purchasing power continues to increase. The latter would expand more rapidly if transport facilities were improved. There is probably no country in the world with such vast potential wealth, but for the full development of the country's resources by private enterprise, the moral and sympathetic support of the authorities and more settled policy are necessary. Foreign capital is required, and any impression that it is not welcome should be dispelled.

Competition in Electrical Supplies.

The United States retained its place as the premier exporter to Brazil during 1925, and the margin between its share of the trade and that of Great Britain widened, although both countries' totals increased. Germany was again third with an appreciably increased share. Taking the Dominions into account, the British Empire, as a whole, was the leading supplier. While actual detailed figures for 1925 were not available, Mr. Hambloch says that it is believed that the exportation of American material to Brazil increased. British manufacturers have to face severe competition in the cases of electrical copper wires and cables, electrical apparatus, dynamos, motors and transformers. German exporters are also very active in the same directions, while Belgian competition is mainly felt in the case of cables. The Americans have large stocks of a very wide range of electrical articles in the principal centres.

Electrical Developments.

During the period under review, a number of small local hydro-electric installations were made, but the only new one worthy of note is that at Cubatao (between Santos and Sao Paulo), which was inaugurated in October last by the Sao Paulo Tramway, Light and Power Co., Ltd. The initial plant consists of two 40,000-h.p. sets; the station is designed for 80,000-kW ultimate capacity. This installation brings the aggregate developed hydro-electric power in the state of Sao Paulo to 250,000 h.p.; Rio de Janeiro has 165,000 h.p., Minas Geraes 52,000 h.p., and Bahia 20,000 h.p. The total development in Brazil is estimated at 500,000 h.p. out of a total available of 9,000,000 h.p.

In March, 1926, a British company obtained the contract for the electrification of 73 km. of the Oeste de Minas Railway. The work is in progress, and this is the first length of railway line to be electrified under the administration of the Federal Government. Nothing has been done in connection with the projected electrification of the Central Railway.

With regard to radio-telegraphy, in April, 1926, the Cia. Radiotelegraphica Brasileira (working under Marconi patents) inaugurated a high-power station at Sepetiba (near Rio de Janeiro), with 12 steel towers, 250 m. in height. There is a receiving station at Jacarépagua (near Rio).

Up to December, 1924, licences had been granted for 2,469 broadcasting receiving sets, and in 1925 a further 1,070 licences were issued, making 3,539. The annual charge for licences is 20 milreis (about 12s.).

Rubber.

In 1925 the exportation of rubber increased, and prices reached a higher level than has been attained for many years. The total in 1925 was 23,537 tons, and the average value was £214 18s. a ton; in the preceding year, while the exportation was not far behind (21,568 tons), the value per ton was only £91. The Ministry of Agriculture has declared that the organisation and systematisation of the exploitation of Brazilian rubber are necessary, but no guidance has been given as to the methods to be adopted.

Legal.

Swedish General Electric, Ltd.'s Patent Application.

THE Swedish General Electric, Ltd., holders of a patent granted to H. K. Schrager for "improvements in alternating current commutator motors," applied to Mr. Justice Tomlin in the Chancery Division on March 1st for an extension of the patent on the ground that by reason of the war they had suffered loss or damage.

Mr. Stafford Cripps supported the application, which was opposed by Mr. Trevor Watson on behalf of the General Electric Co., Ltd., and Mr. McEwan on behalf of Witton-James, Ltd.

Mr. CRIPPS said the patent dealt with an expensive and very novel machine, and, roughly, the reason given for the application was that it could not be marketed during the war in this country because, the machine having no war uses, nobody could take it up, and it was not until after the war that proper attention could be devoted to it. It was a motor that did away with all gearing, and it was not the sort of machine that could be sold straight away. There was a special design for different kinds of installations. Four years was a comparatively short time to develop such an article, but had there been no war the advertising matter sent out would have developed a market here in 1915 or 1916.

Mr. TREVOR WATSON said no explanation had been given why no licence was granted to work the patent here until 1920, when one was granted to the British Thomson-Houston Co., Ltd. The applicants were not engaged on work of national importance during the war, and there was no evidence that they had suffered loss or damage. There was no established trade here in the motor before the war, and they had not reached the point, when war broke out, at which they might confidently have expected to build up a trade. In the words of the section of the Act there was no "loss of opportunity of dealing in or developing the invention," a contention which was only open to applicants who could show that they were engaged in work of national importance. Before 1914, instead of developing the English market, the applicants chose to develop the foreign market. They were content to do nothing during the war, and there was no reason to suppose that they suffered any loss except through their own fault. Everything went to show that if the applicants had made an effort in this country to establish the manufacture and sale of this motor in any way comparable to the effort they made in foreign countries, they would have had no reason to complain of loss or damage resulting from the war.

Mr. MCEWAN associated himself with this statement of the case for the opposition.

Affidavit evidence was read, and after Mr. Cripps had replied, his Lordship gave judgment.

He said the applicants did not do anything before the war to develop the patent in this country, although they developed it abroad, and he must come to the conclusion on the evidence that if the invention had not established itself in the market here before the war it would not be likely to establish itself here during the war. It was a machine of some complication, and could only be applied to existing installations with substantial alterations. It was expensive to make, and was not applicable directly to war purposes. In those circumstances the company's campaign to establish it during the war did not produce any results, and it was not until 1920 that the applicants took it up again, and then they granted a licence to the British Thomson-Houston Co. to manufacture it. The real point was whether, the company not having chosen to develop the patent here before the war, and being handicapped when they sought to do so during the war, there was loss or damage caused by the war. He was satisfied that the course which the applicants took resulted to their disadvantage, but his conclusion was that he ought not to regard that course of conduct as disabling them from seeking relief if they proved that they suffered because of the war. He therefore proposed to give one year's extension of the patent, to date from that day.

Indictment of Cory Bros., Ltd., Quashed.

At Cardiff, on February 28th, Mr. Justice Finlay quashed the indictment against Messrs. Cory Bros., Ltd., upon an allegation of causing the death of a collier by setting a man-trap in the form of an electrically-charged fence. His Lordship held that a corporation could not be indicted for either felony or misdemeanour.

The case against three of the company's officials was, however, proceeded with. The defendants were Thomas Hardie, shift engineer, Temple Davies, power station engineer, and Robert Illingworth, electrical engineer. The evidence at the original proceedings was repeated. This was to the effect that to prevent the continuance of pilfering of coal supplies from the company's power house, a wire fence was erected and made "alive" during certain hours. The defendants were stated to be responsible for its erection and charging. Evidence was given by a man who was with John at the time of his death to the effect that they were not stealing, or endeavouring to steal, coal.

Sir Bernard Spilsbury (Home Office) said that John's death was due to heart failure caused by the passage of an electric current. The extent of the shock depended largely upon the conditions existing; he had known two cases of death from shocks at voltages of 65 and 46.

One of the defendants, R. Illingworth, said that it was only intended to give raiders a "tingle." He did not think that the fence was dangerous; he himself had touched it without feeling any effect.

The hearing was concluded on March 3rd, when after hearing further evidence by the defendants the jury returned a verdict of "Not guilty," and the accused were discharged.

H.M. Inspector of Factories v. Barr & Stroud, Ltd.

In the Justiciary Appeal Court, Edinburgh, on March 1st, counsel were heard in an appeal by H.M. Inspector of Factories, Glasgow, against a decision of Sheriff-Substitute Dods finding a complaint against Barr & Stroud, Ltd., engineers, Glasgow, not proven. The complaint was that the respondents failed to keep a certain horizontal milling machine in their works securely fenced. No accident was known to have occurred at the particular machine involved.

The Court affirmed the original decision, and awarded the respondents 10 guineas expenses.

Infringement of Grid Leak Patent.

The Times reports that a fine of £20 and an order to pay 30 guineas costs were imposed at West London Police Court on March 1st on Alfred Sacks, wireless dealer, Fulham, who was summoned for selling grid leaks to which the false description of "Lissen" was applied.

Mr. H. D. Roome, prosecuting for Lissen, Ltd., stated that they were the patentees of the "Lissen" grid leak. Lately they became aware of the fact that spurious grid leaks bearing their name were being sold at wireless shops. On four different occasions purchases were made at the defendant's shop of Lissen grid leaks, and these, on examination, were found to bear the name "Lissen grid leaks," but were, in fact, spurious, differing in certain important details from the genuine article.

The defendant stated that he purchased the grid leaks in good faith from a man at Brixton, and when he found they were not genuine "Lissen" grid leaks, he requested the man to take them away. Apparently the man must have left some behind, and these were innocently sold by an assistant

Dublin Workmen's Compensation Case.

In the Dublin Circuit Court, before Judge Davitt, last week, Mrs. Mary Slowey, Dublin, claimed compensation from the Dublin City Commissioners in respect of the death of her husband, Michael Slowey.

Mr. W. J. Gleeson, B.L., for the applicant, said that the deceased man was employed on January 17th, 1921, in the electric lighting department of the Corporation of Dublin. While at work he came into contact with a "live" electric wire, and received a severe shock, from which he suffered certain injuries. He was a patient in hospital for some time, but was able to resume work. Later on he developed tubercular disease in the left wrist. The disease spread through his body and he died. The Commissioners had agreed to pay £100 to the applicant, in addition to her costs and expenses.

Judge Davitt made the award accordingly.

B.T.H. Patents in the Irish Free State.

In the High Court, Dublin, before Mr. Justice Meredith, last week, in the case of the British Thomson-Houston Co., Ltd., *v.* Litton & Co., Ltd., Dublin, an application was made to discharge an order of the Master of the High Court, giving liberty to serve a third-party notice on Messrs. Grammont, a French manufacturing firm. The action was brought to restrain the defendants from, as alleged, infringing patents connected with electric lamps, and for damages.

Mr. Justice Meredith, in giving judgment, referred to the grounds urged by the plaintiffs and Messrs. Grammont, on which he was asked to discharge the order, and held that the Master had jurisdiction to make the order *ex-parte*, that the contract to indemnify was a contract to be performed within the jurisdiction, and that the defendants *primâ facie* had claim to be indemnified, though the question whether the claim was sustainable or not was one which would have to be decided in the action. He refused the application to discharge the Master's order, and gave the costs of the plaintiff's motion against the plaintiffs, and reserved the costs of Messrs. Grammont's motion.

British Thomson-Houston Co., Ltd., v. Metropolitan-Vickers Electrical Co., Ltd.

The hearing was commenced in the House of Lords on March 7th, before Lords Dunedin, Sumner, and Blanesburgh, of an appeal arising out of the alleged infringement by the appellants of the respondents' patent 9644 of 1912. Mr. Justice P. O. Lawrence found, after a long inquiry, that the letters patent had been infringed by the appellants, but that they were invalid. In the Court of Appeal, the Master of the Rolls and Lords Justices Warrington and Sargant reversed his decision as to validity, expressing the opinion that the patent was valid and had been infringed. It was against this judgment that the British Thomson-Houston Co. appealed to the House of Lords, contending that the judgment of Mr. Justice Lawrence upon the question of validity was right and should be restored. The respondents maintained that Mr. Justice Lawrence was in error upon the issue of validity, while the Judges in the Court of Appeal were right in fact and law.

The appellants, in their attack upon the validity of the patent, rely upon a prior specification of Tesla, United States, number 459,772, dated September, 1891. There appeared for the appellants Sir Arthur Colefax, K.C., Mr. W. Trevor Watson, K.C., and Mr. Bernard Sandeman, and for the respondents Sir Duncan Kerly, K.C., Mr. J. Whitehead, K.C., Mr. J. M. McEwen, and Mr. J. Mould. The patent in dispute is that granted in 1912 to Emanuel Rosenberg for an invention of improvements relating to synchronous dynamo-electric machines, and the appellants say that in view of Tesla's specification Rosenberg's is not novel.

The arguments extended to considerable length, and the hearing was adjourned.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

Private Bills.

The Yorkshire Electric Power Bill has been read a second time, and the North Metropolitan Electric Power Supply Bill has been read a third time, in the House of Lords.

Radio for Aircraft.

On March 2nd Mr. Day asked the Secretary of State for Air if the experiments that had taken place for short-wave radio-telephony between aircraft in flight and air stations had been successful; and whether that system of transmission would be shortly introduced into the air services.

Sir S. Hoare said that the system of transmission referred to was already in use in the Royal Air Force, and the possibilities of its extension were continually kept in view.

High-Power Broadcasting.

On March 1st, Lieut.-Commander Kenworthy asked the Postmaster-General whether the British Broadcasting Corporation had decided on its policy with regard to the building of high-power stations in order to provide alternative programmes all over the country; if so, how far the work had progressed; whether he had been consulted as to that policy; and, if so, what had been the Government opinion expressed.

Sir W. Mitchell-Thomson said that the present position was that the British Broadcasting Corporation was arranging to carry out certain experiments, and when those were concluded it might be in a position to submit proposals.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Campaign Notes, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

The E.D.A.-E.L.M.A. Campaign.

The official report dated March 7th records the opening of demonstration houses at Glasgow (Minard Road), Chesterfield, Leicester and Birmingham. The following places are opening demonstration houses in the course of a week or two:—Peterborough, Ipswich, Bermondsey, Birmingham, Potteries District, Chorlton, Paisley, and Derby. Last week exhibitions were opened at Dumfries and Bingley. A former Lady Mayoress of Manchester (Mrs. Simon) was to open the Chorlton house on Tuesday last. The Prestwich house is being visited by 300 people a day; 899 visitors attended the Aberdeen house during the first nine days; and 5,144 people visited the Minard Road, Glasgow, house during the first five days. The house at Brent, organised by the Hendon Circle, recorded an attendance of 8,000. Good business is being reported from all quarters as a result of the demonstration houses. Contractors in Manchester and Stockport are distributing competition booklets among patients in the local hospitals.

On February 25th an all-electric home exhibition was opened at Bingley. It was conceived by the Electricity De-

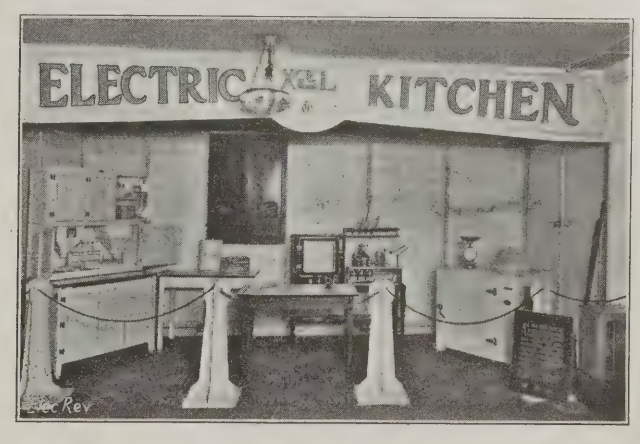
The Bingley Electrical Exhibition.

partment of the Urban District Council (engineer: Mr. P. Clegg) and loyally supported by the local contractors and their employés, who did all the necessary work voluntarily. Seven "rooms" were erected at the Drill Hall; these were furnished by local firms, and the remainder of the hall was loaned to manufacturers for display and demonstration purposes. The exhibition, which remains open until to-morrow (Saturday), has attracted a great deal of public interest; a number of orders have been received, and many inquiries have been made. We reproduce herewith a photograph of the display taken by a local photographer, Mr. G. Tillett.

The Sunderland Corporation Electricity Department has been lent a house by a local builder and has thoroughly equipped it with electrical appliances. A local company has furnished the dwelling in a tasteful manner. The house was opened to the public on March 1st, and is to remain open for a month. The exhibition has been well advertised in the local Press.

An all-electric house in the Crescent, North Road, Durham, arranged by the County of Durham Electrical Power Distribution Co., Ltd., was formally opened by the Mayor and Mayoress of Durham on Tuesday last week. Mr. W. F. T. Pinkney, of the company, received the guests, who were addressed by the Mayor on the advantages of electricity in the home. The house was open all the week and was visited by a large number of people.

Wages in the Engineering Industry.



We recently reported that the London District Joint Committee of the trade unions connected with the engineering industry had recommended a claim for an all-round increase of about 12s. per week in the wages of their members. The matter is now being considered by the Committee's constituents, and a meeting is to be held on March 14th, at which their opinions will be expressed. In the meantime notice has been given of a meeting at York on March 24th, at which the question of a national increase will be discussed by representatives of the engineering trade unions.

Unemployment.

The number of unemployed upon the books of the Employment Exchanges on February 21st was 1,196,100. This was 74,117 fewer than on February 14th, but 70,340 more than on February 22nd, 1926.

Electric Kitchen in a Shop.

In connection with a special household shopping week which they recently held, Messrs. George Henry Lee and Co., Ltd., of Liverpool, constructed in their premises a model electric kitchen, in which were given daily demonstrations of cooking by electricity. This kitchen was equipped with an H.810 "Xcel" electric cooker, manufactured by the Auto-

Electric Cooking in a Department Store.

matic Telephone Manufacturing Co., Ltd, whilst a comprehensive range of electric fires, irons, kettles, and other "Xcel" electric appliances was displayed. As may be seen from the illustration, the kitchen was very realistically arranged.

The Timber Market.

Our Timber Trade Correspondent reports that timber consumption, on the whole, in the U.K. is not moving as quickly as anticipated in the early weeks of the year. Stocks of building, joinery, and general woods are ample at present rates of consumption, which shows an improvement compared with a year ago, but cannot be described as good. Spot prices are not up in proportion to shippers' ideas. The hardwoods also are not yet moving very quickly into consumption; good grade mahogany, however, is selling well, but cabinet and furniture manufacturers are only buying hardwoods from hand to mouth. This hold-off policy may not prove the right one if continued for too long, as the demand for timber, both for general purposes and furniture and other fancy work will grow with the progress in general trade, and prices, no doubt, will increase in sympathy.

Irish Free State Electrical Imports.

The returns just to hand show that the imports of electrical goods, excluding machinery, into the Irish Free State attained a value of £40,934 during January last, as compared with £52,407 in January, 1926.

New Zealand's Preference for British Goods.

The New Zealand Government, which has been placing heavy orders in Britain recently for electrical, railway, and other plant, is again in the market for six electric locomotives, large quantities of locomotive workshop machinery, and material for the electrification of the railway tunnel between the Port of Lyttelton and Christchurch. The New Zealand High Commissioner, Sir James Parr, has just received the details of these requirements, with the authority to obtain tenders from British manufacturers. In the aggregate the orders will run into a very considerable sum of money. The workshop material includes about 40 electric drills, welding plant, mechanical hammers, lathes, bull-dozers, four electric cranes, and many other machines. In addition to the above, the New Zealand Public Works Department, through the High Commissioner, is seeking to place orders for electrical equipment for a new sub-station at Lyttelton (from which the electrification of the Lyttelton tunnel will be operated). The same Department is also in the market for four 500-kVA transformers for the Waikaremoana (Hawke's Bay) power scheme, and four 15,000-kVA, seven 1,000-kVA, and eleven 750-kVA transformers for the Arapuni (Wellington) scheme. Manufacturers can obtain full particulars of all these requirements from the High Commissioner for New Zealand, 415, Strand, W.C.2.

Price Reductions.

Increased production and improved manufacture have enabled the London Electric Wire Co. & Smiths, Ltd., to reduce the price of its "Lewcos" screens and bases for inductance coils and radio transformers.

Industrial Electric Cooking Equipment.

The General Electric Co., Ltd., has opened a showroom at Magnet House devoted entirely to industrial electric cooking equipment, in which there is a comprehensive display of "Magnet" apparatus designed and built for installation in hotel kitchens, restaurants, canteens, bakeries, &c. The showroom includes the following exhibits: Roasting ovens, double-oven ranges, compartment roasting ovens, cabinet roasting ovens, ship's galley ranges, bread-baking ovens, pastry ovens,

G.E.C. Industrial Cooking Showroom.

steaming ovens, dough-nut cookers, grillers, fish fryers, grilling and cooking plates, boiling tables, stock pots and soup boilers, vegetable boilers, bainmaries, hot cupboards, urns and water boilers. The apparatus displayed in this showroom is representative of similar equipments which have been built and supplied by the General Electric Co., and are in use all over the world, having been installed on board ship and also in hotels, hospitals, and canteens. A view of the showroom accompanies this note.

New French Company.

A new company has been formed in Paris (50, Rue de Lisbonne) with a capital of 9½ million francs, and the title La Société d'Electricité de Lille et de sa Banlieue, to extend the electricity supply facilities in the Lille district.

A Southport Development Booklet.

The Southport Electricity Department (engineer: Mr. E. Moxon) has produced an illustrated booklet dealing with the advantages of electric cooking and the facilities which the Department provides. A number of cookers are illustrated and particulars are given of the charges for the hire of these, and photographs of the showrooms and lecture theatre are reproduced. Two circulars, one in rhyme, are being sent out with the booklet to consumers in Southport. One of these circulars deals in a comprehensive way with domestic electricity. A cookery exhibition is at present being held at the showrooms.

Recent Contracts.

Among the orders recently received by Messrs. Cecil Hodges & Co., Ltd., Dalston, are one for the lighting control switchgear, including the stage and projecting room switchboards, in the new Astoria Theatre, Charing Cross Road; and one for the extension of the switchboard at the Stationery Office depôt, Harrow, placed by the Office of Works.

The Anglo-Argentine General Electric Co., Ltd., has recently secured an order for the whole of the lamps required for the offices of *La Prensa*, the prominent Buenos Aires newspaper. The lamps are of the "Osram" brand.

Local Exhibitions.

Maidstone.—The illustration which accompanies this note depicts one of the stands arranged by Messrs. E. A. Gardner and Sons, Ltd., Maidstone, at the electrical exhibition recently held in that town. Messrs. Gardner are electrical contractors,

Messrs. Gardner's Stand at Maidstone.

but they also have a special branch, and showroom, for the retailing of electrical supplies. The stand illustrated displayed the products of a number of leading manufacturers; another stand was devoted to "Standard" appliances.

Basingstoke.—An electrical exhibition was opened at the Town Hall on February 24th by the Mayoress (Mrs. C. Bowman), supported by the Mayor (Alderman Bowman), Sir Alfred Holbrook, M.P., Mr. F. Swarbrick, and Mr. V. W. Dale (E.D.A.). The Mayor, in his opening remarks, briefly outlined the history of the undertaking, and paid a tribute to Mr. Swarbrick's energy and enthusiasm. In declaring the exhibition open, the Mayoress said that the electrically-fitted rooms clearly demonstrated how electricity could brighten the home and lighten the labours of the home-makers. Sir Alfred Holbrook, M.P., and Mr. V. W. Dale also spoke. The exhibition consisted of a suite of three rooms, dining-room, lounge, and bedroom, tastefully furnished by Messrs. Moody & Co., and electrically equipped by the Credenda Conduits Co., Ltd. In addition, there was a separate exhibit of electric sewing machines, "Creda" cookers and fires. Mrs. Mole, assisted by Miss Swarbrick, gave a series of lectures and demonstrations throughout the exhibition. Prior to the opening of the exhibition, the Mayor started up the new 600-kW Diesel plant (Mirrlees-Bickerton) at the generating station in Brook Street.

Cardiff.—A house designed on the lines of the E.D.A.-E.L.M.A. prize house by Messrs. Edwards & Jones, Cardiff, was opened recently at Cardiff Drill Hall. It was erected by Messrs. G. L. Ward & Co., Cardiff, and consists of a lounge, dining-room, two bedrooms, bathroom, lavatory, garage and scullery, all of which are electrically equipped. The exhibition is under the auspices of the *Western Mail*, and the house has been equipped by Messrs. David Morgan, in co-operation with Messrs. Ward. The appliances on view are representative of a number of the leading electrical companies.

Dumfries.—Mrs. O'Brien, wife of the Provost, opened, on March 1st at St. George's Hall, Dumfries, an electrical exhibition organised by the local electrical contractors under the chairmanship of Mr. W. Johnston, burgh electrical engineer. Among the exhibitors are Metro-Vick Supplies, Ltd., the British Thomson-Houston Co., Ltd., the General Electric Co., Ltd., Belling & Co., Ackroyd & Best, Souter & Co., Ltd., the Edison Swan Electric Co., Ltd., Siemens & English Electric Lamp Co., Ltd., the Chloride Electrical Storage Co., Ltd., the Hotpoint Electrical Appliance Co., Ltd., and the Singer Sewing Machine Co. Messrs. R. Barbour and Sons, drapers, have fitted up a shop window with special and Sons, drapers, have fitted up a model shop window with special lighting.

Indian Electrical Imports.

The official returns show that the value of the electrical equipment imported into India during December last was 34,00,000 rupees, as compared with 23,26,500 rupees in December, 1925.

The Co-ordination of Government Contracts.

The Parliamentary Correspondent of the *Daily Telegraph* states that last session the Estimates Committee of the House of Commons made the valuable recommendation that a Co-ordination of Contracts Committee should be established for the purpose of arranging for the bulk purchase of supplies for a series of Government departments instead of each department continuing to place its own contracts. This recommendation, designed in the interests of economy, will shortly bear fruit, as it is understood that the Admiralty, the War Office, and the Air Ministry have now agreed to appoint representatives on the Committee. In addition, the Office of Works and the Post Office—departments which have heavy contracts—will participate, whilst the Treasury will naturally take a hand

Trade Announcements.

Medway's Safety Lift Co., Ltd., states that its telephone number has been changed to: Hop 4767-9.

Owing to their premises having been sold, Messrs. Hubber and Son, electrical engineers, of 85 & 86, South Street, Exeter, are selling their stock-in-trade, plant, &c., by auction on March 21st.

The Walsall Hardware Manufacturing Co., Ltd., last week opened a new store at Castle Warehouse, Nottingham, which will contain a full range of "Walsall" specialities, conduits, ironclad switch- and fuse-gear, &c., and will be under the personal direction of Mr. F. H. Blaxley.

The telephone number of Messrs. E. N. Hunter & Co., 68, Victoria Street, S.W.1, is now "Victoria 0259."

Mr. T. J. Stobart, 316, Ivydale Road, S.E.15, has been appointed sole representative in the British Isles for the Canadian directories of the Fraser Publishing Co., Montreal. The metal products (automotive, electrical, hardware, radio, machinery industries, &c.) directory of this series has just been published.

Mr. J. E. Fenton, wireless and electrical engineer, has removed to 44-46, Canmore Street, Dunfermline.

New Catalogues and Lists.

The Chloride Electrical Storage Co., Ltd., Clifton Junction, near Manchester.—Three illustrated and priced pamphlets dealing, respectively, with "mass" type batteries for long slow discharges; h.t. radio "mass" type batteries; and "Monobloc" automobile batteries.

The Cambridge Instrument Co., Ltd., 45, Grosvenor Place, S.W.1.—An illustrated pamphlet advertising the "Cambridge" dial thermometer.

The Electrical Equipment & Carbon Co., Ltd., Bank Buildings, 109-111, New Oxford Street, W.C.1.—Price List S.C.7, dealing with "Siemens" carbons for kinematograph projection; and List M8, containing details and prices of "Elin" d.c. and a.c. motors.

Messrs. Elliott Bros. (London), Ltd., Century Works, Lewisham, S.E.13.—Catalogue sections containing illustrated descriptions of some new portable testing sets and the "Elliott" cable-core temperature indicator.

Messrs. J. H. Tucker & Co., Ltd., King's Road, Tyseley, Birmingham.—A series of booklets, pamphlets, and folders illustrating and describing ironclad switch- and fuse-gear, tumbler switches, switchplates, and other "Tucker" products.

Messrs. Hans Renold, Ltd., Burnage Works, Didsbury, Manchester.—An illustrated brochure dealing with the company's chains and chain drives for power transmission.

The B.E.N. Patents, Ltd., 96-100, Victoria Street, S.W.1.—An illustrated folder advertising the "B.E.N.-Myers" hydraulic car-washing plant. Priced.

The British Thomson-Houston Co., Ltd., Crown House, Aldwych, W.C.2.—A folder containing illustrations and prices of electric light pendants, shade fittings, and lanterns.

Messrs. Allen-Liversidge, Ltd., Victoria Station House, S.W.1.—Catalogue E.W. Section 1 and E.W. Pamphlet 7 dealing exhaustively with "Pontelec" electric welding equipment (Buckley, Saunders & Co., Ltd.) and welding supplies, including rivet heaters. Fully illustrated.

Siemens & English Electric Lamp Co., Ltd., 38-39, Upper Thames Street, E.C.4.—Catalogue No. 164, containing illustrated particulars and prices of bowl fittings, "Silvaray," "Silvalux," and "Moonstone" glassware, alabaster bowls and other lighting fittings. Also March price sheet of electrical accessories, fittings, and appliances.

The Jackson Electric Stove Co., Ltd., 143, Sloane Street, S.W.1.—March calendar-blotter advertising the company's "20B" cooker for hiring schemes.

The D.P. Battery Co., Ltd., Bakewell, Derbyshire.—A booklet illustrating and describing applications of "Kathanode" batteries for locomotives in power stations and works.

The Hart Accumulator Co., Ltd., Stratford, E.15.—March calendar-blotter advertising the company's batteries; also three new showcards advertising the company's motor-car starting and lighting batteries.

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—Leaflet 4,383, illustrating several examples of bakelite mouldings as produced by the company.

Pope's Electric Lamp Co., Ltd., 5, Arthur Street, New Oxford Street, W.C.2.—March calendar-blotter advertising "Elasta" lamps.

Falconbridge & Co., Cefco Works, Beck Street, Nottingham.—A priced and illustrated catalogue of fan regulators, dimmers, arc resistances, curtain controllers, &c.

Hopkinson Induction Motors, Willesden Lane, North Acton, W.3.—March stock list of single- and three-phase motors.

Bankruptcy Proceedings.

D. T. Donovan and H. A. Langlois, trading as the London Electrical Co., 119, St. Mary Street, Cardiff, formerly 124, Queen Street, Cardiff.—The adjourned public examination of these debtors was held recently at Cardiff. The statement of affairs showed a deficiency of £1,025. Debtor Langlois said he had been in business as an electrical engineer since 1921, having £50 capital when he commenced. In May, 1926, debtor Donovan joined him as a partner. He put £50 into the partnership when he joined. An accountant prepared a statement which showed a net profit for 12 months of £1,086 and a balance sheet showed stock in hand at £400. It was proposed to form a limited company with £2,000 capital, and premises were taken in St. Mary Street. Debtor Langlois agreed that in the last seven months between trading losses and private drawings their loss amounted to £986. An order was made for a statement showing goods received and payments made between certain dates, and the examination was further adjourned.

G. R. Sims, Hartlepool Street, Thornley, Durham, motor and electrical engineer.—The public examination of this debtor was held on March 1st, at Durham. The statement of affairs showed ranking liabilities of £421, and there was a deficiency of £296. Debtor attributed his failure to the mining dispute. It appeared that he commenced business in 1924 and was successful until the beginning of the dispute, after which he had to sell some of his stock at a loss. The examination was adjourned.

A. H. Richardson (Radio Supplies), wireless manufacturer, 4, Rose Hill, and Wellingborough Road, Finedon, Northants.—First meeting held March 8th, at the Official Receiver's Office, The Parade, Northampton; public examination, April 1st, at the County Hall, Northampton.

A. E. S. Challener, wireless engineer, 277, St. Sepulchre Gate, Doncaster.—Last day for proofs for dividend, March 16th. Trustee, Mr. L. J. Clegg, Official Receiver's Offices, 14, Figtree Lane, Sheffield.

J. N. Davenport and L. A. Hackett (Davenport, Hackett and Co.), electrical engineers and contractors, 36, Spring Gardens, and Albert Mill, Albert Street, Manchester.—Second and final dividend of 3s. 2 9/50d. in the £, payable March 15th, at 21, Spring Gardens, Manchester.

G. E. Grainger (Grainger & Co.), wireless engineer, 38, Market Street, Ashby-de-la-Zouch.—Receiving order made February 28th; on debtor's own petition.

G. Turner (Radio Supply Co.), electrician and wireless dealer, 34, Mesnes Street, Wigan.—First and final dividend of 3s. 10¾d. in the £, payable March 18th, at the offices of the Official Receiver, 11, Dale Street, Liverpool.

Company Liquidations.

Neutron, Ltd., Sicilian House, Southampton Row, W.C.—The first meetings of creditors and shareholders of this company were held on March 3rd, at Carey Street, a compulsory winding up order having been made on February 15th at the instance of a creditor. The Official Receiver reported that the company was registered on May 3rd, 1924, with a nominal capital of £500, and its primary object was to acquire the assets and business of William Bennison and T. E. de Vries, who were then dealing in the "Neutron" crystal. By an agreement dated June 30th, 1924, the company acquired from them the goodwill and assets of their business. The company undertook to pay all debts and liabilities of the vendors up to an agreed sum of £100. The purchase consideration was fixed at £394, which was satisfied by the issue of fully-paid shares. Mr. W. Wolsey, a director, had stated that shortly after the incorporation of the company an agreement was entered into with the firm of V. Zeitlin & Sons, by which the latter became sole distributors for Great Britain and Ireland of "Neutron" crystals. They transacted a considerable volume of business with the company, and, according to Wolsey, had paid sums amounting to approximately £45,000. There were agreements with other firms for distributing the "Neutron" and other crystals, and the position in regard to those would be required to be considered by the liquidator when appointed. There had been several issues of debentures, but inasmuch as certain of them were issued within three months of the commencement of the winding up for a past consideration they would appear to be void. A number of judgments were obtained against the company, and, as further capital could not be obtained, the directors, on January 18th last, decided to put the company into voluntary liquidation. On the same day Bennison, under the powers contained in his debentures, appointed a receiver on his behalf. On February 21st, however, the latter wrote to the Official Receiver, on behalf of Bennison, to the effect that he was retiring from the receivership and he had since handed over the estate to the Official Receiver. A receiver, appointed on February 7th by P. G. Marr & Co., Ltd., holders of debentures for £3,150, had not taken any action, with the result that the Official Receiver was in possession of the assets. No statement of the company's affairs had been lodged, but the unsecured

liabilities were estimated at £6,311, in addition to which there was a sum of £3,450 claimed to be due in respect of debentures. With regard to the assets, the book debts were estimated at £500. The Official Receiver had realised £65, and there was a balance of about £127 on the receiver's account, which was, however, subject to his remuneration and solicitor's costs. The chief assets of the company appeared to be goodwill. So far as could be ascertained at the present time about £20,000 had been expended by the company in advertising. The remaining assets consisted of crystals, wireless parts, tins, cartons, &c., and they were of small value unless the goodwill were bought. Two offers had been received for the goodwill, trade marks and stock, the higher of which amounted to £600. Wolsey attributed the failure of the company to excessive advertising. In Bennison's opinion the failure was due to excessive advertising and insufficient working capital to enable orders to be executed. The company had also kept a large and expensive staff, and had incurred losses in connection with the manufacture of and experimenting with radio sets. A liquidator was nominated.

Paragon Electric Welding Co., Ltd.—Winding up voluntarily. Liquidator, Mr. A. J. Francis, 25, Llanishen Street, Cardiff. A meeting of creditors was held at Merthyr House, Cardiff, on March 7th. Particulars of claims to the liquidator by March 31st.

Cinema Apparatus Co., Ltd.—Winding up voluntarily. Liquidator, Mr. F. Wheatcroft, 105, Market Street, Manchester. A meeting of creditors was held at the Liquidator's offices on March 9th. Particulars of claims by April 2nd.

Sterling Accessories, Ltd.—A meeting of members is called for April 6th, at the offices of Messrs. Thorpe & Pearson, 5, John Street, Bedford Row, W.C., to hear an account of the winding up from the liquidator, Mr. W. B. Pearson.

Autoveyors, Ltd.—Winding up voluntarily. Liquidator, Mr. E. W. Dilley, 84, Victoria Street, S.W. Meeting of creditors at 84, Victoria Street, S.W., March 15th.

Private Arrangements.

W. H. Taylor, radio engineer, 106, Bridge Street, Warrington.—A meeting of creditors was held recently, at the offices of Mr. J. Willett, solicitor, Warrington, when a statement of affairs was submitted which disclosed liabilities of £929, of which £529 was due to unsecured creditors, and the debtor's mother was a creditor for £400. The assets were valued at £151 net, leaving a deficiency of £778. It was reported that the debtor commenced in a small way after the war, and four years ago took the present premises. At that time he had no capital of his own, but borrowed £400 from his mother. Details as to the trading were not available, but the debtor stated that the turnover had been as high as £50 per week, and as low as £12 weekly. He attributed his present position to the long illness and subsequent death of his wife. It was decided that, subject to the debtor's mother withdrawing her claim, the estate should be dealt with under a deed of assignment in favour of Mr. P. S. Booth, Exchange Chambers, 2, Bixteth Street, Liverpool, as trustee, together with a committee of inspection consisting of Mr. W. Draper (Messrs. H. E. Beardsall, Ltd.), Mr. S. Lockwood, and Mr. J. F. Warburton. The following are creditors:—

	£		£
O'Brien, R. A., Ltd. ...	95	Bush House	50
Beardsall, W. B., & Co., Ltd.	60	Wood, E., Ltd.	30
		Bankers	28
Mullard Wireless Service Co., Ltd.	62	Mackay & Co., Ltd. ...	25
		B.N.B. Wireless, Ltd. ...	20

C. W. Page and T. K. Garrard, trading as the Southern Sales Co., Rye, Sussex, motor accessory dealers and electrical and wireless factors.—A committee of inspection, appointed at a meeting of creditors, recommends the adoption of a proposal whereby the business will be formed into a limited company and the claims of the present trading creditors secured by a first mortgage debenture.

Herbert Thomas Ellis, Earsham Street, Bungay, Suffolk, wireless and electrical engineer, &c.—A meeting of creditors was held on March 2nd, at the offices of Messrs. Harman and Gowen, 7, Queen Street, Norwich. A statement of affairs was presented which showed liabilities of £943, and assets of £305, leaving a deficiency of £638. Mr. Gowen reported that the debtor commenced business about five years ago with a capital of £400 or £500. He had kept a day book and cash book. No trading figures were available at the meeting. Mr. Gowen added that in consequence of pressure by creditors a deed of assignment had been executed in his favour on February 25th. The debtor had no offer to make, and attributed his position to bad trade and bad debts. The creditors decided that the deed of assignment should be confirmed, and that the trustee should make an immediate endeavour to sell the business as a going concern. The following are creditors:—

	£		£
Shell-Mex, Ltd.	100	Brown Bros.	25
S.D.H. Mfg. Co.	141	Harmsworth, Ltd. ...	40

Dissolutions of Partnership.

H. Van Leemputten & Beneu, manufacturers of wireless and gramophone cabinets, 157a, Stanhope Street, Euston Road, N.W.—Messrs. H. Van Leemputten and P. Deneu have dissolved partnership. Mr. Leemputten will attend to debts and continue the business in his own name.

Springvale Electrical Co., electrical engineers, Springvale Works, Masbro Road, West Kensington, W.—Mr. G. H. Armitage and Mr. D. Heaton have dissolved partnership. Mr. Armitage will attend to debts and continue the business.

Social Events.

Bad weather did not prevent the gathering together of a very large audience consisting of members of the London office staff and friends of W. T. Henley's Telegraph Works Co., Ltd., at a performance given by Henley's Dramatic Club on Saturday evening last, at the Cripplegate Theatre. Ian Hay's domestic comedy, "The Sport of Kings," was the piece presented, and the high standard of excellence for which the club is known was well maintained, if not surpassed. The audience was very appreciative, and we may add our own congratulations. Mr. Frank J. Bettley as Amos Purdie, J.P., was a marked success, and Miss Hilda Starbuck as his daughter Katie was charmingly natural and free. Messrs. A. V. Burnett and W. G. Turner filled prominent positions with ability. Miss Irene Bradbrook had an inconspicuous part to play as Mrs. Purdie, but she did it well. Indeed, everybody contributed his or her share in providing a most enjoyable evening.

The staff of the Bury Electricity Department held its annual dinner on February 28th, at the Royal Hotel, Bury. Mr. J. G. Potts, the borough electrical engineer, presided, and among those present were the chairman of the Electricity Committee (Councillor Evans), Messrs. J. Stephenson (resident engineer), J. Murray (works superintendent), S. J. Watson (Salford), Councillor J. Pilling, and Mr. J. Renshaw (Fleetwood). The dinner was followed by a concert.

On February 26th the Seecol Social and Sports Club (Strand Electric and Engineering Co., Ltd.) held a fancy dress dance at Hana's Studios, W. There was an excellent variety of costumes, and eight prizes were given by the directors. Music was provided by the Revels Dance Orchestra.

The Indoor Games Section of the G.E.C. Social and Athletic Club held a successful dance at the Lecture Room, Magnet House, on February 18th, arranged by Mr. H. J. Fisher, the hon. secretary of the section.

The Outdoor Section of the Osram-G.E.C. Lamp Works Social and Athletic Club held the sixth dance of the season at the Osram Works on February 19th, when over 300 members and their friends spent a most enjoyable evening.

The annual staff dinner of the Reliance Telephone Co., Ltd., was held at Anderton's Hotel, Fleet Street, on February 26th. Mr. E. Silbermann, managing director, presided, and in responding to the toast of "The Directors," proposed by Mr. W. T. Ashton, A.M.I.E.E., he referred to the growth of the company, and the excellent spirit of good fellowship and loyalty which prevailed amongst the employés. A concert followed, and the evening was brought to a close. A vote of thanks for those responsible for the arrangements was proposed by Mr. A. V. Cannon, sales manager.

New Showrooms and Offices.

The Barking Urban District Council has applied to the Electricity Commissioners for sanction to a loan of £4,000 for the provision of showrooms and offices for the Electricity Department.

The Accrington Corporation's electricity showrooms, in Burnley Road, were to be opened this week. During the past year the costs of running electric houses have been collected with a view to helping prospective tenants of all-electric houses.

Book Notices.

An illustrated folder has been issued by the Edison Swan Electric Co., Ltd., London, to show the way to construct an interesting crystal set l.f. amplifier, called the "R.C. Twosome." The circuit employs two valves (R.C.2 and P.V.2) with a resistance capacity coupling unit. A transformer is used to couple the crystal set with the first valve. The circuit is certainly exceedingly simple, and can be put together quickly at a low cost. The design is not to increase the range of the crystal set with which it is incorporated, but to amplify the signals received so as to operate a loud speaker. The simple operations of building the set are very clearly explained in the instruction folder (complete with blue-print) which is issued free.

Messrs. Adam Hilger, Ltd., have issued a booklet dealing with developments in spectrography, &c., during the year ended June 30th last. This contains particulars of new instruments devised by the company and a digest of the literature of the subject published during the year. It also embodies a list of orders obtained by the company from all parts of the world.

"Doubling Our Coal Power" is the title of a pamphlet by Mr. A. Allport, who has made a close study of fuel economy for upwards of 15 years; he holds, and claims to prove, that low-temperature carbonisation is to-day a commercial proposition, and has issued this pamphlet at his own expense to set out the advantages of the "Coalite" process. (Wadsworth & Co., Keighley, price 6d.)

"Notes on Electricity and Service Electrical Apparatus as Applied to 1926 Artillery." London: H.M. Stationery Office. Price 2s. net.

"Controllers for Electric Motors," by H. D. James. Pp. vi+522; figs. 444. London: Chapman & Hall, Ltd. Price 21s. net.

"Mesures Electriques," by J. Granier. Pp. 200; figs. 85. Paris: Armand Colin. Price 9 fr.

Registered Electrical Contractors.

The following applications for registration were accepted by the Executive Committee of the National Register of Electric Installation Contractors on March 4th :—

Grotecke, K., Heaton Chapel, Stockport.
Coates & Co., Harrogate.
Lyons, W. H., Manchester.
Lea Bros., Birmingham.
Cooper, C., & Co. (London), Ltd., South Kensington.
Cooper, W. R., Redcar.
Keep & Roebuck, Sheffield.
Shawcross, J. T., Old Trafford, Manchester.
Morement & Bridges, Calne.
Hammond & King, Nottingham.
Elliott, R. H., Newbiggin-by-Sea.

For Sale.

The Crittall Manufacturing Co., Ltd., has for disposal several surplus generating sets. Nottingham Corporation Electricity Department invites offers for surplus generating plant, &c., at the St. Anns and North Wilford power stations. Barking U.D.C. Electricity Department has for disposal boilers, feed pumps and generating sets. The superintending engineer, Coastal District R.A.F., invites offers for one 44-kVA Siemens alternator, one turbine pump, two 440-V a.c., and one 220-V d.c., motors and one 10-kW Siemens generator, all lying at the Leuchars Aerodrome, Scotland. (See our advertisement pages to-day.)

Prices of Raw Materials.

Messrs. James Forster & Co., reporting on March 5th, stated :—"Closing prices of lead yesterday were £28 17s. 6d. for March, and £29 5s. for June, a rise on the week of 12s. 6d. per ton. . . . There is a slow but steady improvement in demand from all branches of the trade in this country, even cable manufacturers absorbing slightly larger quantities than heretofore. Increased activity is reported from the Continent, where Germany and Russia have been buying considerable quantities. In the United States also firmer conditions prevail. . . . Supplies here are still ample. . . . Reviewing the position as a whole, we can see no reason to anticipate other than continued firm markets with higher prices."

The following prices are only general, and they may vary according to quantities and other circumstances :—

CHEMICALS, &c.		Price Mar. 8th.	Fortnight's inc. or dec.
a Acid, Oxalic	per lb.	5¾d.	...
a Ammoniac, Sal	per ton.	£60	...
a Ammonia, Muriate (large crystal)	,,	£52	...
a Bisulphide of Carbon	,,	...	...
a Borax	,,	£25	...
a Copper Sulphate	,,	£25 10s.	...
a Potash, Chlorate	per lb.	4d. to 4½d.	...
a ,, Perchlorate	,,	5½d.	...
a Shellac	per cwt.	£13 10s.	...
a Sulphur, Commercial	,,	£9 10s.	...
a ,, Roll	,,	£9 10s.	...
a Soda, Chlorate	per lb.	3¼d. to 3½d.	...
a ,, Crystals	per ton.	£5 to £5 5s.	...
a Sodium Bichromate, casks ...	per lb.	4d.	...
METALS, &c.			
b Aluminium, Ingots...	per ton.	£107 to £112	...
b ,, Wire	per lb.	1/6 to 2/-	...
b ,, Sheet	,,	1/3 to 2/9	...
p Babbitt's Metal and Anti-friction Metal—			
Grade I	per ton net.	£274	£3 inc.
Grade II	,, ,,	£190	£3 inc.
Grade III...	,, ,,	£98	£2 inc.
c Brass (rolled metal 2" to 12" basis)	per lb.	9⅝d.	...

Lighting and Power Notes.

Aldershot.—New Plant.—As the result of a further interview with the Electricity Commissioners, the borough electrical engineer has been asked to submit to them for consideration a scheme for the installation of new plant at the electricity works. It is proposed to install two internal-combustion engines of 600 h.p. each, together with generators, auxiliaries, switchgear, and necessary interconnecting cables, at an approximate cost of £16,000.

Alsager.—Inauguration of Supply.—The formal inauguration of the supply of electricty for the district took place on February 26th, the chairman of the Urban District Council switching on the supply, which is provided by the Electricity Distribution of North Wales and District, Ltd.

Barnes.—Electricity in Small Houses.—The Housing Committee of the L.C.C. has recommended that electricity be installed for lighting, cooking, heating and domestic purposes in 57 houses on the Castelnau housing estate, and that 599 houses be wired for lighting only. The Urban District Council will lay the cables on the whole of the estate and provide the necessary services free of charge to the L.C.C., but the latter will undertake the wiring of the houses. The charges will be 4d. per kWh for lighting, with an alternative tariff of 2½ per cent. of the ratable value of the premises per quarter, plus ½d. per kWh during the summer months and 1d. per kWh during the winter months for electricity consumed. The cost of the scheme to the L.C.C. will be £1,082 for wiring the 57 houses for lighting, cooking and heating, and £6,887 for wiring 599 houses for lighting only.

Basingstoke.—Extension of Supply.—The Town Council is applying for a Special Order authorising it to supply electricity within the area of the Rural District Council. The estimated cost of the extension is £20,020.

Opposition to Bill.—The Council has also decided to oppose the Wessex Electricity Bill.

Bicester.—Electricity Supply.—The Urban District Council has consented to an application by Messrs. Cooper & Hanns for a Special Order to supply electricity to the town. The maximum prices proposed are 1s. per kWh for lighting, 4d. per kWh for power, and 6d. per kWh for public lighting.

Bridport.—Inquiry.—An inquiry was opened on February 25th by Col. T. C. Ekin, for the Electricity Commissioners, relative to a proposal by the Town Council to carry out an electricity scheme. Opposition was made by the Rural District Council, which sought to include a time limit in which the work should be carried out, the Manufacturers' Association, which ask for the insertion of a clause safeguarding the rates, and by the local gas company.

Burnley.—Mains Extensions.—The Corporation is to carry out extensions to feeders and distributing cables, at a cost of £5,000.

Clitheroe.—Inauguration of Supply.—The power station was to be opened on Wednesday last. The Corporation has undertaken to wire houses and to charge slightly in excess of the standard charge per kWh until the cost of wiring is met.

Continental.—France.—A group has been formed in the Senate to do all in its power to further the exploitation of the country's numerous waterfalls. This group will keep before it the idea of the electrification of railways, the employment of electricity in all the domains where it is feasible, and the speeding-up of the construction of the necessary power stations.

The Paris-Orleans Railway Co. has placed a contract for the establishment of a h.p. transmission line between the hydro-electric station at Eguzon and a transformer station at Maregis. The line is to be capable of transmitting electricity at a pressure of 220,000 V, but at first the pressure will be limited to 150,000 V.

Switzerland.—A scheme is under consideration for the erection of a large hydro-electric power station to utilise the water power of the Rivers Inn and Spols in the Lower Engadine. It is estimated that by the construction of three dams, a total of 230,000 h.p. can be made available.

Belgium.—A new central electricity station has recently been completed in Ghent, the plant comprising two 10,000-kW steam turbo generators. The old station, which has a capacity of 3,000 kW, is being converted into a transformer station.

Derby.—Electricity Extensions.—The Corporation proposes to borrow £83,500 for the following electricity extensions :—Mains, £45,000; transformers, £10,000; motors, £3,000; boiler house plant, £25,500.

Edinburgh.—Electricity Extensions.—At the Dean of Guild Court on March 3rd, plans were passed for the erection at the Corporation's power station at Portobello of a turbine house and a switch house, part of an extension scheme which will cost about £200,000. The new turbine house will contain two 25,000-kW turbo-alternators. Plans for additions to

the pump house have already been passed and an application for permission to extend the boiler house will come before the Dean of Guild Court soon. The extensions are being pushed on with a view to an additional supply of electricity being made available by the winter of 1928.

Harrogate.—Year's Working.—The accounts of the Corporation electricity undertaking (engineer, Mr. G. Wilkinson) for the year ended March 31st last, show a total income of £52,690, as compared with £49,450 in the preceding year. Working expenses amounted to £28,965, as against £25,121, leaving a gross profit of £23,725 (£24,329). Capital charges absorbed £10,277, and there was a net surplus of £13,448, as compared with £11,343 in 1924-25. The capital expenditure during the year amounted to £24,436, the chief item being £14,560 for machinery. The sales of electrical energy increased from 3,782,411 to 4,495,011 kWh, and the maximum supply demanded from 2,397 to 2,793 kW.

Horsham.—Opposition to Order.—The Urban District Council is to oppose an application for an Order by the Electric Supply Corporation, Ltd., to supply electricity in areas adjoining the Council's area, which are included in an extension scheme contemplated by the Council.

Japan.—Electrical Development.—Work has commenced on the construction of a steam power plant for the I.G.R. which will have a capacity of 60,000 kW. The cost is estimated at 5,000,000 yen.

The Lugawa Denryoku K.K. is to utilise the Azuma river for generating electricity, and the first section of its scheme provides for the erection of a power station at Matsudani with a capacity of 22,700 kW.

The new power station of the Tokyo Denryoku K.K., at Tajima-machi, Kanagawa-ken, has recently been completed. Two 35,000-kW sets have been installed.

Kirkham.—Electricity Supply.—There has been a favourable response to the *questionnaire* sent out by the Urban District Council regarding the probable demand for electricity in the area, and it has been decided to apply for an Order to proceed with the scheme. It has not yet been decided whether the Council will carry out the scheme itself or place it in the hands of the Preston Town Council.

Leeds.—Loan Sanctioned.—The Corporation Electricity Committee has obtained sanction to the borrowing of £95,000 for services.

Liverpool.—Electricity Charges.—The Corporation Electricity Department will introduce from March 31st a new scale of charges for combined business and private premises, being a fixed quarterly charge of 7 per cent. on the ratable value with a minimum assessment of £18, plus ½d. per kWh for electricity consumed in Liverpool, Bootle, and Litherland, and ¾d. per kWh in Waterloo and Gt. Crosby.

Llandudno.—Supply for Small Houses.—In all future municipal housing schemes, the Council has decided that provision shall be made for electric wiring.

Lytham-St. Annes.—Loan.—The Town Council is applying for sanction to borrow £5,000 for the purchase of electrical apparatus to be let out on hire.

Manchester.—Progress during January.—During the month of January the Corporation electricity undertaking showed an increase in connections of 1,885 kW, bringing the total to 301,934 kW; and the number of applications received for supply, including consumers for additional supplies, was 916, representing a total of 3,624 kW. The number of hired cookers connected increased by 97, bringing the total actually on circuit to 2,788. Applications for the hire of cookers totalled 129. A new 7,500-kVA, 33,000/6,600-V transformer was put into commission at Oldham Road sub-station, and one 500-kVA transformer was installed at Connolly's (Blackley), Ltd., sub-station in place of two 125-kVA transformers.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Stoke-on-Trent.—Multi-part tariff for domestic consumers: 5s. per room per quarter, plus 1d. per kWh for the first 1,000 kWh per quarter, ¾d. per kWh for the next 1,000, and ½d. per kWh for all energy consumed in excess of this amount.

Preesall.—Lighting: 8d. per kWh.

Birkenhead.—The 10 per cent. increase made in September last to be withdrawn.

Grantham.—*The Urban Electric Supply Co., Ltd.*—Lighting: From 10d. to 9d. per kWh; the increase made in the charges for power and heating owing to the coal dispute is to be discontinued.

Wallasey.—Lighting reduced to 4½d. per kWh, and in addition a discount of 5 per cent., for prompt payment of accounts to consumers on lighting, heating, cooking, and small power tariffs. No increase was made to this class of consumer during the coal dispute.

Hampstead.—The flat rate for lighting reduced from 4d. to 3½d. per kWh, the charges for cooking, heating, and power to remain as at present, *viz.*, 1d. per kWh. Mr. J. Leadbeater, borough electrical engineer, states that this is the lowest flat rate charge in the London and Home Counties area, and one of the lowest in the country.

Southampton.—The increase of 20 per cent. for lighting, heating, cooking and power, made owing to the higher cost of coal, is to be withdrawn.

Reigate.—New Plant.—The Town Council has applied for consent to install an additional generating set with a capacity of from 800 to 1,000 kW, at an estimated cost of £20,000, plus £1,000 for foundations. Inquiries are also to be made as to the possibility of a supply of electricity in bulk, and the terms.

Sandbach.—Inauguration of Supply.—An electricity supply for the district was formally inaugurated by the chairman of the Urban District Council on February 26th. Electricity is obtained from the Electricity Distribution of North Wales and District, Ltd.

Sheffield.—Inquiry.—An inquiry was held by the Electricity Commissioners at Sheffield recently concerning the claims of rival undertakings to supply Cudworth, near Barnsley, with electricity. The Electrical Distribution of Yorkshire, Ltd., applied for statutory powers to supply Cudworth and Billingley. The Carlton Main Colliery Co. is already supplying electricity in Cudworth, where the Power Company is also supplying a number of consumers. For the Distribution Co. it was stated that it had not been successful in obtaining the consent of the Cudworth Urban Council, and it asked that such consent be dispensed with. The Colliery Co. had three pits, and at Frickley a generating station had been erected, linked up with the other two pits. It was the obvious intention of the colliery company to compete with the power company without incurring any of the statutory restrictions and obligations which the allied companies would be under if they obtained the Order. Mr. W. B. Woodhouse, engineer and manager of the Distribution Co., suggested that the colliery company took steps regarding supply after it knew of the impending application of the Distribution Co. He contended that it would be safer for the people to get a supply from the Distribution Co. because it would be subject to Government control and the prices regulated by the Electricity Commissioners. For the Cudworth Council, Col. Raley said that all through the prices charged by the colliery company had been lower than those of the Distribution Co., and the latter did not make any definite terms until the Council was morally and legally bound to the colliery company, whose terms were cheaper. The Commissioners will give their decision in due course.

Sidmouth.—Electricity Supply.—It was reported at the February meeting of the Urban District Council that the Electricity Committee hoped to be able to announce a reduction in the price of current at the next meeting, to come into operation as from March 31st. The Committee recommended the Council to adjourn *sine die* the proposed provision of a new generating set at the electricity works at an estimated cost of £3,500, as it was felt that the expenditure for standby plant was not justifiable at present.

Southend-on-Sea.—New Power Station.—At a meeting of the Town Council on March 7th, it was decided to apply for sanction to erect a new power station at Hole Haven, on Canvey Island, at an estimated cost of £649,000. The station will have a capacity of 25,000 kW.

South Shields.—Electrical Progress.—The electrical engineer reports that under the assisted wiring scheme 983 additional consumers were connected during the December quarter. Electricity sold totalled 212,053 kWh, and the revenue obtained was £5,750. Since the inception of the scheme a total revenue of £17,398 has been obtained from this source.

Special Orders.—Application has been made to the Electricity Commissioners by Basingstoke Corporation for a Special Order authorising it to extend its area of electricity supply so as to include certain parishes in the rural districts of Basingstoke, Kingsclere, and Whitchurch.

The Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them authorising Messrs. E. H. Leach and W. H. Phillips to supply electricity in the borough of Tenby; Major C. H. B. Prescott-Westcar to supply in the urban district of Axminster, the borough of Chard, and part of the rural districts of Axminster and Chard; the Tilbury Urban District Council to supply electricity in its area, and for the amendment of the Romford and District Electric Lighting Order, 1913; and the Crowborough District Gas and Electricity Co., to raise additional capital for electricity purposes.

Stoke-on-Trent.—Change-over.—At a recent meeting of the Corporation Electricity Committee the engineer reported upon the change over of supply to consumers in the centre of Tunstall, and was instructed to carry out the work over a period of three years at an estimated cost of £6,000.

Supply to Uttoxeter.—The Committee has received a letter from Mr. W. C. C. Hawtyne, consulting engineer to the Uttoxeter Urban District Council with regard to a supply of electricity, and the Committee has informed him that the Corporation would give a supply at the city boundary provided the Council would erect the necessary line to take supply thereat.

Loans Sanctioned.—The Corporation Electricity Committee has received sanction to loans totalling £23,100 for mains, services, and sub-station plant.

Torpoint.—Electricity Supply.—It was reported at a meeting of the Urban District Council on March 3rd that representatives of the Torpoint Electricity Supply Co., Ltd., had attended a private meeting of the Council and made definite proposals with a view to securing the withdrawal of the

Council's application and asking for its support to the company's application. Contingent upon this, the company offered a reduction in the price of electricity, which it promised to obtain from Plymouth as soon as it was economically possible, and also made proposals regarding the removal of the overhead wires in Fore Street. The Council had been given a definite assurance that if it supported the application of the company the cable would be laid across the River Tamar from Plymouth within three years of the date of the Order.

Wallasey.—Electricity Extensions.—The Corporation has prepared a scheme for extensions to the electricity works involving the expenditure of £150,000. The scheme includes the installation of a new 12,500-kW turbo-alternator and two boilers, thus doubling the capacity of the station. Tenders will shortly be invited for the supply of new plant.

Wirksworth.—Street Lighting.—The Urban District Council has accepted an offer by the Derbyshire and Nottinghamshire Electric Power Co., to pay the cost of converting the street lamps on the route of the cables, and maintain and light them at a cost to the Council of £3 10s. per lamp per annum. The agreement is for a period of three years.

Worthing.—Street Lighting.—The Corporation is to convert the existing street lamps from gas to electric lighting, and all the 60-watt lamps are to be replaced by lamps of 100 watts. The total cost of the scheme is £4,000.

Tramway and Railway Notes.

Continental.—Belgium.—The Chamber, by 73 votes to 61, has decided to abandon the proposed underground railway, linking up the north and south stations in Brussels.—*Reuter* (Brussels).

Germany.—Work is well in hand on the electrification of the railway between Munich and Rosenheim, Bavaria. Electric trains are already in operation on part of the line, which is expected to be completed by May next.

Austria.—The electrification of the last section of the State railway between Innsbruck and Bregenz—that between Feldkirch and Bregenz—has recently been completed.

Spain.—A concession has been granted for the construction of an electric tramway to connect the Granada-La Zubia railway with Monachil.

Switzerland.—Last week a new line was opened at Zurich on the left bank of the lake. For years this section of railway has given trouble to both the town authorities and the Federal Railways, as Zurich has grown so rapidly and has so spread out, that the line which formerly ran outside the city, passed inside it and cut through no fewer than twelve streets. In order to avoid the danger of such a state of affairs, the city voted 20 millions of francs, and the Federal Railways 30 millions, towards the cost of a new line. This is at last finished, and is, of course, electric. Special attention has had to be given to the tunnels, one of which passes under the bed of the River Sihl, and has been specially lined to ensure its being perfectly watertight. This Wiedikon tunnel is 507 metres long, the Ulmberg one is 260 metres, and the Willishofen tunnel is 903 metres. A new station has been built at Enge.

Halifax.—Track Renewals.—The Tramways Committee has recommended the renewal of the tramway track from Ratten Clough to Causeway Foot, at an estimated cost of £3,467.

Japan.—Tokio.—The first underground railway which is being constructed by the Tokio Underground Railway Co., Ltd., is expected to be completed by the end of this month, and work on the construction of the second line will be commenced shortly.

Railway Electrification.—It is understood that the Kurihara Kido K.K. at Wakayagimachi, Migagi-ken, intends to electrify its railway at an estimated cost of 550,000 yen.

A scheme is in hand for the formation of a company, with a capital of 250,000,000 yen, for the construction of a rapid transit electric railway between Osaka and Tokio.

Plans are being prepared for the electrification of 337 miles of the following Government lines:—Tokaido Line, Atami-Numazu, 13 miles; Numazu-Akashi, 300 miles; Tabata-Omiya, 14 miles; and Kobubunju-Hachioji, 10 miles. According to *Commerce Reports*, the Tokaido line extensions consist of two separate projects which, when completed, will form one continuous line. The first extension from Atami to Numazu will link the former with the Tokaido main line at Numazu. The 300-mile stretch between Numazu and Akashi is perhaps the most important project yet contemplated, since it includes the electrification of one of the heaviest traffic railway divisions in the empire. That portion of the Tokaido system now electrified, together with the proposed extension, will serve 16 prominent towns and cities. Three of the most important sea ports are situated within its limits, as well as the largest manufacturing centres.

Liverpool.—New Cars.—The Ministry of Transport has sanctioned the borrowing by the Corporation of £74,000 for the provision of new tramcars.

Newcastle-on-Tyne.—New Route.—The Corporation Transport Committee has recommended the laying of a tramway track across the new high-level bridge over the Tyne, now in course of construction, to form another connection between Northumberland and Durham. The estimated cost is £19,000, plus £3,000 for equipment.

Telegraph and Telephone Notes.

"Beam" Radio-Telegraphy.—Australian Service Tests.—On March 7th, Post Office authorities commenced re-testing "beam" wireless communication between the Marconi Company's stations at Grimsby and Skegness and the Australian stations near Melbourne.

Bolivia.—New Radio Station.—Congress has granted 30,000 bolivianos for the erection of a wireless station at Magdalena, the capital of the Province of Iténez. The province has a population of only 95,000, or just over 0.5 per square mile.—*Reuter's Trade Service* (La Paz).

France.—Radio-Telephony.—The Algiers Chamber of Commerce recently discussed the subject of wireless telephony between France and Algeria. After considering the conclusions arrived at by the Constantine Chamber of Commerce, the Algiers Chamber declared that it was of the opinion that wireless telephone communication between France and Algeria would offer the greatest advantages, particularly in intensifying the relations between the two countries and in relieving the cables. The Chamber expressed the wish that the French Post, Telegraph and Telephone Administration should study a plan for the establishment of wireless telephony between France and Algeria.—*Reuter's Trade Service* (Paris).

Germany.—Berlin-New York Telegraphy.—After a lapse of twelve years, Germany can once more telegraph direct to the United States, for on March 4th the newly-laid Emden-Azores cable was officially declared to be in service by the Minister of Posts and Telegraphs, Dr. Schaetzle, at a banquet in Berlin to celebrate the occasion. Soon after war broke out, all German cable lines to the United States were cut by the Allies, and ever since telegrams from Germany to the United States have had to be transmitted through foreign cable companies. The new cable of the German Atlantic Telegraph Co. runs as far as the Azores, where it connects with the lines of the Western Union and the Commercial Cable Companies, so that messages can now be sent direct from Emden to New York.—*Reuter* (Berlin).

League of Nations.—Proposed Radio Station.—At the 44th session of the League of Nations Council, which commenced at Geneva, Switzerland, on March 7th, a proposal to build a special wireless station to enable the League to communicate with all Governments in emergency was to be discussed. The *Daily Mail* understands that the chief objection to the project is the cost.

Russia.—Automatic Telephony.—The Nizhni-Novgorod telephone works has begun to manufacture automatic telephone apparatus. This apparatus will be installed by the Commissariat of Posts and Telegraphs on its new system.—*Reuter's Trade Service* (Moscow).

South America.—Telephone Statistics.—The extent and growth of the telephone lines of the two companies which operate in Buenos Aires and in neighbouring provinces, such as Buenos Aires, Santa Fé, and Cordoba, may be estimated from the following statistics recorded in Messrs. Tornquist and Co.'s recent report:—

Companies.	No. of offices.	Number of Apparatus. Capital and suburbs.	Interior.	Total.
United R. Plate Telephone Co.	336	106.128	51.892	158.020
Soc. Co-operativa Telefónica	26	6.609	1.026	7.635
Total, 1926 ...	362	112.737	52.918	165.655
Total, 1925 ...	334	104.895	45.390	150.285

The United River Plate Telephone Co. is constantly extending its radius of action. The increase in the number of apparatus in 12 months was more than 15,000, equivalent to 10 per cent.

The Telephone Service.—Statistics.—Official figures show that there were 1,510,775 telephones in use in Great Britain and Northern Ireland up to December 31st, 1926, made up of 1,477,003 Post Office telephones, 21,736 in the Hull, Guernsey and Jersey systems, and 12,036 private stations connected

with the Post Office system. The total represents an average of 34 telephones for every 1,000 inhabitants in the area.

Automatic Exchanges.—The comprehensive programme of automatic telephone conversion which is being carried out this year by the Post Office provides for installations in 12 provincial towns (making, with the 35 already equipped, 47 in all) and for four installations in London. Holborn and Bishopsgate will be the first London exchanges to be converted, and later in the year Sloane and Western exchanges will follow. In the provinces the work has already begun; Harrogate was "cut over" on February 26th, and Sheffield's installation on March 5th. At intervals the change will be made at Halifax, Hanley, Wakefield, Exeter, Nottingham, Colwyn Bay, Burnley, Brighton, Leicester, and Southport.

Transatlantic Telephony.—New Receiving Station.—Work at the transatlantic wireless telephony receiving station at Kemback, near Cupar, is progressing. The land line linking the station with the local post office has been completed, and in the power house four dynamos, as well as the engines for driving them, have been placed in position, and the large control board and switchboard have been fitted up. Two types of receiving apparatus, one of American and one of British make, are in course of being built at the receiving hut. Dr. Baillie, of the Bell Telephone Co., New York, is in charge of the installation of the American receiving apparatus.

Germany's Application.—The German Post Office has asked the British Post Office whether, in view of the good results attending the experiments in telephony between Frankfort and New York, *via* London, it will be possible to include Germany in the transatlantic telephone service. The British Post Office has not yet replied.—*Reuter* (Berlin).

Radio Notes.

Amateur Broadcasting.—Manchester Station.—Mr. J. E. Kemp, chairman of the Manchester Branch of the Wireless League, is one of the chief members of the Manchester Radio Scientific Society, which recently opened a new transmitting station with call sign 2HD. Mr. Kemp has stated that the Society is a purely scientific body experimenting by unorthodox methods. *The Times* reports him as follows:—"We are merely a research station with about 80 members, affiliated to the Association of Radio Societies, and our area extends to Preston on the north, Crewe on the south, and the West Riding of Yorkshire on the east. We are giving experimental transmissions to our members on a wave-length of 440 metres on Sunday afternoons, using 10 watts. All who contributed to the programme did so voluntarily, and all the money subscribed by members goes in material for the upkeep of the station and for research work." The matter has been raised in the House of Commons, and it is understood that the Postmaster-General has cancelled the licence granted to 2HD, and has issued a new licence which, it is stated, will make further concerts such as those broadcast in the past impossible, but a *Daily Mail* reporter has been told that the Society intends to continue broadcasting and will risk the consequences.

Canada.—Licences.—Listeners who "dodge" the dollar licence fee are liable to visits by Dominion Government inspectors, accompanied by Royal Canadian mounted policemen who may ask to see the receipt for the fee, says *World Radio*. Commander Edwards, of the Radio Branch, has ordered a drive in Toronto, Ottawa, Montreal, Halifax, and Victoria to round up the fee "dodgers," who are estimated to number nearly two hundred thousand. The maximum fine is £10 and costs, but the usual fine for a first offence is £1 and costs. Of the estimated 350,000 owners of radio receiving sets in Canada only 168,000 have taken out licences.

Wave-lengths.—Under the arrangements with the United States Department of Commerce, Canada is supposed to use 17 wave-lengths, six exclusive and eleven jointly with United States stations.

China.—Regulations.—Radio broadcasting has been officially recognised in Manchuria and regulations for its control established; at present the facilities are very limited. The North-Eastern Wireless Long-Distance Telephone Service, an official Chinese bureau in Mukden controlling Chinese wireless communication in Manchuria, which is erecting a broadcasting station in the three eastern provinces, has promulgated regulations which, *Commerce Reports* says, will govern broadcasting and the importation, sale, and installation of receiving sets and parts in Manchuria.

Paraguay.—New Station.—When a receiving and broadcasting station at Asunción was approaching completion its range was found to be only 180 kilometres, and, as this is insufficient, another transmitter of greater power has been ordered and will soon be installed. The country (200,000 square miles in area) is generally flat, and of the whole population (approaching 1,000,000) only 8 per cent. are tribal Indians. A radio club has already been formed with a considerable membership. Messages are received from Buenos Aires, Rosario, Sao Paulo, Rio de Janeiro, and other stations in Argentina and Brazil.—*Reuter's Trade Service* (Asunción).

Rumania.—New Company.—A Rumanian company is to be established which will monopolise broadcasting and the manufacture of radio apparatus, and possibly telephone and telegraph apparatus. The International Radio Broadcasting Commission of Geneva has allotted a wave-length of 236.2 metres to Bucharest, says *Commerce Reports*, but the local director of radio communication has requested permission to use a wave-length of 460.5 metres.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the Electrical Review containing the advertisement is given in parentheses below.

Contracts Open.

Adwick-le-Street.—March 21st. Urban District Council. Cables, boxes, pillars, and necessary materials and apparatus for a distribution network scheme. (March 4th.)

Ashford.—March 14th. Electricity Department. Two electrically-driven centrifugal pumps (capacity 30,000 gal. per hour). (February 25th.)

Australia.—Melbourne.—April 26th. Postmaster-General's Department. Telephone switches. (B.X. 3254.)* Instrument cords. (B.X. 3255.)*
April 12th. Cord-type switchboards. (B.X. 3280.)*
May 17th. Resistances and Reactances. (B.X. 3307.)*
May 23rd. State Electricity Commission. Switchgear and accessories. (B.X. 3285.)*

Ayr.—March 23rd. Ayrshire Education Authority. Electric lighting and central heating of new primary school at Irvine. Plans with Master of Works, Education Offices.

Brecon.—March 16th. Electricity Department. Generating plant and switchgear, battery of accumulators and connections, underground and overhead lines. (February 25th.)

Dumfries.—March 16th. Dumfriesshire Unionist Association. Electric lighting and heating installation at headquarters building. Messrs. J. Barbour & Bowie, architects, 27, Castle Street, Dumfries.

Edinburgh.—March 21st. Electricity Department. Twelve months' supply of cables, box frames and covers, house service fuse boxes and fuseboards, meters and meter boards. (March 4th.)

Erith.—March 24th. Electricity Department. H.p. and l.p. underground cables, joint boxes, &c. (See this issue.)

Hamilton.—County of Lanark District Committee of the Middle Ward. Electric lighting installation in connection with the erection of 190 houses. Mr. P. C. Smith, District Offices, Hamilton.

Hazell Grove and Bramhall.—March 23rd. Urban District Council. One oil circuit breaker and kiosk and seven 20-kW transformers and kiosks, cables and two e.h.p. substation switchgear panels. (March 4th.)

Ilford.—March 22nd. One 500-kW rotary convertor, with transformer, switchgear, &c. (March 4th.)

India.—March 22nd. India Store Department. Two 250-kW Diesel-engine alternator sets, with switchgear, transformer, &c. (February 18th.) 30,000 oil insulators. (March 4th.)

DELHI.—March 17th. India Store Department. Oil-engine-driven generator sets with switchboard. (B.X. 3264.)*

Kettering.—March 23rd. Electricity Department. E.h.p. and l.p. armoured cables and one 1,000-kVA transformer. (March 4th.)

London.—BERMONDSEY.—March 16th. Board of Guardians. Six months' supply of electric lamps. Mr. H. H. Reeve, clerk to the Guardians, 283, Tooley Street, S.E.

ISLINGTON.—March 19th. Board of Guardians. Electrical supplies for 6 months. Mr. A. King, clerk, Guardians' Offices, St. John's Road, Upper Holloway, N.19.

Manchester. — March 18th. Electricity Committee. Three 500-kVA and two 250-kVA static transformers. (March 4th.)

Plympton St. Mary.—March 31st. Urban District Council. H.p. cables, underground and overhead mains, h.p. and l.p. switchgear, transformers and transformer kiosks. (See this issue.)

New Zealand. — WELLINGTON.—May 31st. Public Works Department. 50-kVA transformers for the Waikaremoana electric power scheme. (B.X. 3294.)* 50-kVA transformer for Arapuni scheme. (B.X. 3293.)*

June 7th. Railway sub-station equipment, Lake Coleridge electric power scheme. (B.X. 3295.)*

May 4th. General Post Office, Stores Division. Sub-station protectors. (B.X. 3286.)*

June 13th. New Zealand Railways. Machine tools, workshop equipment and overhead electric travelling cranes. (A.X. 4344.)*

June 6th. Six electric locomotives. (A.X. 4355.)* Overhead equipment for the Christchurch-Lyttelton electrification scheme. (B.X. 3301.)*

Oldham.—March 26th. Electricity Department. One 80-ton electric travelling crane. (March 4th.)

Rhondda.—March 26th. Electricity Department. Twelve months' supply a.c. ordinary and prepayment meters, mains and house service material. (February 25th.)

Roumania.—BUKAREST.—April 2nd. 600,000 porcelain insulators. (B.X. 3314.)*

Salford.—March 14th. Tramways Department. Electric lamps, steel tires, m.i. castings, &c. General Manager, 32, Blackfriars Street.

South Elmsall.—March 19th. Electric lighting installation at Westfield Lane Council School. Education Department, County Hall, Wakefield.

Southend-on-Sea.—April 9th. Light Railways and Electricity Department. Remote-controlled rotary convertors. (See this issue.)

Torquay.—March 16th. Electricity Department. One 6,000-kW turbo-alternator, with surface condenser and auxiliary plant. (February 25th.)

Tynemouth.—March 14th. Electricity Department. Three 250-kVA and one 500-kVA transformers. (March 4th.)

Walthamstow.—March 23rd. Electricity Department. L.p. cables and v.i.r. wires for 12 months. (See this issue.)

Warrington.—March 14th. Electricity Department. Motors and transformers. (February 25th.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Birkenhead.—Electricity Committee. Accepted:—
Cable (£6,800).—W. T. Henley's Telegraph Works Co., Ltd.; Macintosh Cable Co., Ltd. (£846).

Bury.—Town Council. Accepted:—
Boiler, stoker and economiser, Chamber Hall Power Station.—Clarke, Chapman & Co.
Electrically-driven pump for the baths.—Royles, Ltd.

Bradford.—Tramways Committee. Accepted:—
Ten miles of copper trolley wire (£922).—T. Bolton and Sons, Ltd.

Canterbury.—City Council. Accepted:—
Motor convertor (£2,591).—Bruce Peebles & Co., Ltd.
Feeder cables (£2,497).—Standard Telephones & Cables, Ltd.

Chelmsford.—Town Council. Accepted:—
Pumping installation at the swimming bath (£377), including an automatic motor float.—Electric Supply Corporation, Ltd.

Cheltenham.—Highways Committee. Accepted:—
Electric light fittings for 12 months.—Edison Swan Electric Co., Ltd.

Colchester.—Town Council. Accepted:—
Pipework at the new electricity station (£8,970).—J. Spencer, Ltd.

Dumfries.—Town Council. Accepted:—
Storage battery (£2,890).—D.P. Battery Co., Ltd.

Elvington, near Dover.—
Electric lighting of 102 houses.—Mr. Gordon C. Lent, Dover.

Glasgow.—Gas Committee. Recommended:—
Extension of electric cable from Tennant Street to Dalmarnock gasworks (£336).—A. Anderson & Co.
Special Acts Committee. Accepted:—
Electric light installation, St. Rollox Registration Offices —John Wright.

Tramways Committee. Accepted:—
D.c.c. wire.—Enfield Cable Works, Ltd.; British Insulated Cables, Ltd.; and W. T. Henley's Telegraph Works Co., Ltd.

Hitchin.—Rural Council. Accepted:—
Laying services on the Knebworth housing site, wiring houses and supplying and fixing fittings with five lights per house (£7 10s. per house, inclusive).—Stevenage Electric Light Co.

London.—LONDON COUNTY COUNCIL.—Education Committee. Installation of electric lighting at the trade school for girls in Barrett Street, Marylebone:—

E. Wender. (Recommended.)	**£947**
Alpha Manufacturing and Electrical Co., Ltd.	995
Anderson, Angell & Co.	1,062
J. F. Prendergast	1,095
L. G. Tate & Co., Ltd.	1,098
Alex. Hawkins & Sons	1,157
Richard Hunt & Co., Ltd.	1,167
J. Briggs & Co.	1,241
Pinching & Walton	1,362

Installation of electric lighting at Crondall Street school, Shoreditch:—

Bailey & Incledon, Ltd. (Recommended.)	**£480**
Anderson, Angell & Co.	529
Alpha Manufacturing & Electrical Co., Ltd. ...	550
A. Hawkins & Son	619
City Electrical Co.	623
Pinching & Walton	624
A. Meckhonik	637
L. G. Tate & Co., Ltd.	647
Smith & Hammond, Ltd.	655
Gaillard, Robinson & Co.	661
R. Hunt & Co., Ltd.	674
General Electrical Maintenance Co.	983

Electrical installation at the county secondary school, Eltham:—

Alpha Manufacturing and Electrical Co., Ltd. (Recommended.)	**£1,140**
Anderson, Angell & Co.	1,162
L. G. Tate & Co., Ltd.	1,250
E. E. Dyne	1,290
Alex. Hawkins & Sons	1,390
Woolwich Metropolitan Borough Council ...	1,687

GREAT WESTERN RAILWAY CO. Accepted:—
One 2-ton petrol-electric crane for Newport.—Ransomes and Rapier, Ltd.
Electrically-driven pumps for Landore.—F. Pearn and Co., Ltd.

ADMIRALTY.—
2-pint kettle hot plates.—Edison Swan Electric Co., Ltd.

ISLINGTON.—Borough Council. Accepted:—
Electric lamps for 12 months.—Edison Swan Electric Co., Ltd.

METROPOLITAN ASYLUMS BOARD.—Works Committee.
The following tenders were received for the installation of electric lighting at Millfields:—

South-Western Electrical Co.	£805
Alpha Mfg. & Electrical Co., Ltd.	835
Smith & Hammond, Ltd.	837
Read & Partners, Ltd.	881
A. Higginbotham & Sons	899
H. J. Galliers	937
R. Whipp & Co.	940
Sabine & Co.	1,047
T. Clarke & Co., Ltd.	1,050
C. J. Drake & Co.	1,078
Phillips & Dart	1,086
A. Dean & Co., Ltd.	1,099
J. Briggs & Co.	1,119
A. Cozens	1,144
Brightside Foundry & Engineering Co., Ltd.	1,200
C. F. Williams	1,237
Page & Miles, Ltd.	1,325
General Electrical Maintenance Co.	3,860

SOUTHERN RAILWAY.—
Six months' contract for electric lamps.—Metro-Vick Supplies, Ltd.

Manchester.—Electricity Committee. Accepted:—
Twelve months' supply of motor-starting switches.—Metropolitan-Vickers Electrical Co., Ltd.
Electric motors.—F. & A. Parkinson, Ltd.; Electromotors, Ltd.
450 street lanterns.—Cable Accessories Co., Ltd.
12,000 yd. 3-in. weldless-steel tubes.—British Mannesmann Tube Co., Ltd.; Bromford Tube Co., Ltd.
Circulating-water pumps.—Mather & Platt, Ltd.
L.p. circulating-water and steam pipes.—Aiton & Co., Ltd.
Four circulating-water pump suction valves.—J. Blakeborough & Sons, Ltd.

Northampton.—Northampton Corporation. Accepted:—
Electric wiring of Gipsy Lane housing estate (230 houses).—Lowke & Sons, Ltd.

Prestwick.—Ayrshire Education Committee. Accepted:—
Installing electric light at Prestwick school extensions (£242).—W. Ross, Ayr.

South Africa.—Johannesburg.—Municipal Council. Accepted:—
8 miles 6,600-V cable (£12,838).—British Insulated Cables, Ltd.
½ mile ditto (£385).—British General Electric Co., Ltd.
—*S.A. Mining and Engineering Journal.*

South Shields.—Housing Committee. Recommended:—
Wiring 204 houses on the Cleadon Park estate (£5 14s. per non-parlour house, £6 4s. per parlour house, and £5 4s. per bungalow).—Moore & Oliver, Birtley.

Torquay.—Electricity Committee. Accepted:—
Railway siding and coal-handling plant at Newton Abbot power station (£19,500).—Ed. Bennis & Co., Ltd.
Six transformers (£613).—Hackbridge Cable Co., Ltd.

Wimbledon.—Electricity Committee. Accepted:—
Twenty-six 100-kVA transformers (£2,222) and six 200-kVA ditto (£730).—Hackbridge Electric Construction Co., Ltd. Two 500-kVA ditto (£628) and two 750-kVA ditto (£790).—Bruce Peebles & Co., Ltd. One 1,155-kVA ditto (£575).—British Electric Transformer Co., Ltd.
H.p. switchgear equipments (£2,000).—Brush Electrical Engineering Co., Ltd. L.p. ditto (£2,552).—G. Ellison.
Extensions to switchboards at generating station and two sub-stations (£3,867).—A. Reyrolle & Co., Ltd.

Health Committee. Recommended:—
Refrigerator at isolation hospital (£55).—Electrolux, Ltd.

Forthcoming Events.

Women's Engineering Society.—Friday, March 11th. 26, George Street, Hanover Square, W. 6.30 p.m. "The Electrification of Rural Districts." Dr. J. Purves.

Junior Institution of Engineers.—Friday, March 11th. 39, Victoria Street. 7.30 p.m. "Cupolas." Mr. J. Wolstenholme.

Birmingham Electric Club.—Friday, March 11th. Grosvenor Hotel. 7 p.m. Annual dinner.

Royal Society of Arts.—Monday, March 14th. 8 p.m. Cantor Lecture. "Some Industrial Applications of Electrothermics," by Mr. G. I. Finch.

Paisley Association of Electrical Engineers.—Tuesday, March 15th. Town Hall, Paisley. 7.30 p.m. "Apprentice Papers."

National Association of Supervising Electricians (Birmingham District Centre).—Tuesday, March 15th. Grand Hotel, Birmingham. 7.15 p.m. "Rotary Convertors." Mr. H. C. E. Jacoby.

Institution of Electrical Engineers.—Thursday, March 17th. London. 6 p.m. Faraday lecture, "What is Electricity?" Prof. W. M. Thornton.

London Students' Section.—Friday, March 18th. Imperial Hotel, Russell Square, W.C., 7.15 p.m. Annual dinner.

(North-Eastern Centre).—Monday, March 14th. Armstrong College, Newcastle-upon-Tyne. 7 p.m. "The Stability of Large Power Systems." Mr. F. H. Clough.

(Western Centre).—Monday, March 14th. Exeter. "Home Lighting." Mr. R. B. Mitchell.

(Sheffield Sub-Centre).—Wednesday, March 16th. Royal Victoria Hotel, Sheffield. 7.45 p.m. Address by the President, and smoking concert.

(South-Midland Centre (Wireless Section)).—Wednesday, March 16th. University, Birmingham. 7 p.m. "Characteristics of Audio-frequency Amplifiers used in Telephonic Repeaters." Mr. C. Robinson.

(South-Midland Students' Section).—Friday, March 18th. Annual joint meeting.

British Electrical Development Association.—Thursday, March 17th. Savoy Hotel. Annual dinner.
Friday, March 18th.—Royal Society of Arts. 7.30 p.m. "Refrigeration." Mr. N. E. Barber.

Edinburgh Electrical Society.—Thursday, March 17th. Royal Scottish Society of Art, 117, George Street. 8 p.m. "Ventilation." Mr. E. N. Beavis.

The "Electrical Review" Service Department.

Inquiries must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—

Wire or strip suitable for the manufacture of thermal time lag devices.

Notes.

Late Legal.

Wareham Electric Supply Co., Ltd.—The petition of Mr. W. E. Weston for the compulsory winding up of this company again came before Mr. Justice Eve on March 8th; it was supported by creditors. The company asked for a further fortnight's adjournment, and this was granted.

Electrical Association for Women.

On February 25th, Metro-Vick Supplies, Ltd., entertained a party of the Birmingham Branch of the Electrical Association for Women, which visited the British Industries Fair. A demonstration of electric cooking and various types of electric domestic appliances was given, as well as a very interesting lecture by Mr. Edinborough, of the above company.

At the invitation of the British Thomson-Houston Co., Ltd., a party of the Manchester District Branch of the Association visited the company's King Street, Manchester, showrooms on March 4th, when an interesting programme included a demonstration of electric cookers and a short lecture on "How your house is wired," in addition to a demonstration of the "R.K." loud speaker and an exhibition of kinematograph films showing the making of the "Mazda" lamp.

The inaugural meeting for the formation of the South Wales and Monmouthshire Branch will be held at the City Hall, Cardiff, on Thursday, March 24th, at 6.30 p.m. The Lady Mayoress will preside.

Appointments Vacant.

Chief clerk (£400) for the Sunderland Electricity Department. Assistant mains engineer for the Bedford Corporation Electricity Department. Meter engineer for the Rangoon Electric Tramway and Supply Co., Ltd. Engineering assistant for the Borough of Wallasey Electricity Department. Electrical engineer to superintend overhead h.p. line erection for the Crediton U.D.C. (See our advertisement pages to-day.)

Artificial Light as an Aid to Aerial Navigation.

A paper on the above subject was read by Mr. H. N. Green (Royal Aircraft Establishment, Farnborough), at the meeting of the Illuminating Engineering Society on February 22nd. The first point considered was the location of the beacon. It was generally preferable to select a site on ground only slightly above the average level of the surrounding country, and to mount the beacon on a tower of sufficient height to clear ground mists. The chief features of such a light should be a distinctive character; it should be reliable in operation and require little attention, and should have a maximum range for a given power consumption.

Distinctiveness was, in practice, usually attained by flashing at regular intervals, the optical system rotating so that a series of beams rotated across the sky. This method was usually preferable to flashing the actual filament, for in the case of the very powerful gasfilled lamps used for this work, an appreciable time was required for the filament to cool. (This point was demonstrated by Mr. Green with the aid of one of the largest gasfilled projection lamps yet manufactured.) Distinctiveness might also be based on colour: the strontium beacon invented by Mr. Toulmin Smith and Capt. Davis utilised an oxy-acetylene flame, with an endless chain running through a bath of strontium chloride, which imparted a bright orange colour to the flame. It had, however, been replaced by the electric neon beacon which, besides having an unmistakable colour, could be flashed with great rapidity.

In the next section of the paper the author discussed the distribution of light and attainable beam-candlepower, after which the lighting of the Croydon-Lympne air-route was described. The neon beacon erected at Croydon utilised 8 kW at 5,500 V, and had a total horizontal candlepower of approxi-

mately 13,700. Flashing mechanism was included on the low-voltage side, and the beacon had a character consisting of a 2-second flash followed by a ½-second eclipse. The official range was given as 45 miles, but in clear weather the light had been seen by pilots from the French side of the channel.

The illumination of an aerodrome to facilitate landing was carried out with floodlight projectors, and Mr. Green presented a very striking photograph illustrating the effect produced. Another device illustrated was the arrangement of lights to form an arrow, giving to pilots information regarding the direction and strength of the wind. The paper concluded with an interesting discussion of the problem of flying during fog. Flying was not at present attempted when visibility was very bad, but there was always a chance of a pilot being caught in a fog. In this case he derived material assistance from the "leader cable" carrying a low-frequency alternating current, which marked out the route into the aerodrome. Once he could pick up the course of the cable by means of the instruments on the aeroplane he could safely guide himself to the landing ground, where he received the assistance of the special lights. The lights employed at Croydon for this purpose would probably consist of neon tubes at intervals down the landing course, suitably protected in cast-iron boxes embedded in concrete. When above the fog-level the pilot could often locate the landing place by the local illumination of the fog by the lights below.

Marconi Radio Apparatus.

The accompanying illustrations show two somewhat unusual forms of radio apparatus. Fig. 1 is a reproduction of a telegraph and telephone set for submarines; the power of the transmitter is 1.5 kW, and it has a c.w. telegraphy range of 300 miles and a telephony range of 100 miles. The valve to be seen in the panel on the left-hand side is the telephone modulator, and alterations in tuning are made by means of the plugs and sockets indicated at the top of the picture.

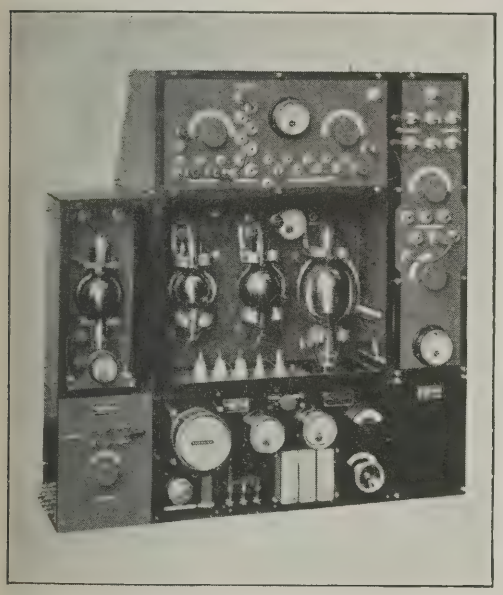

Fig. 1.—A Submarine Radio Set.

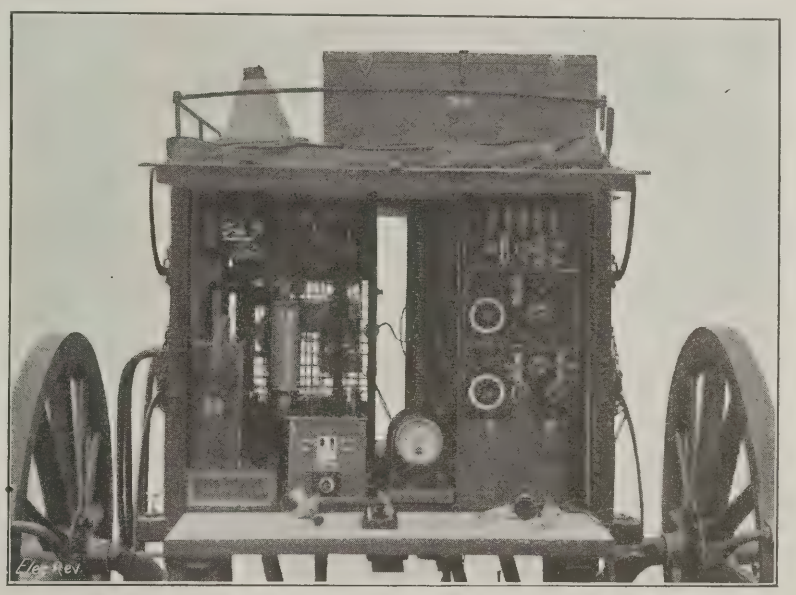

Fig. 2.—An Army Field Radio Outfit.

Fig. 2 also shows a combined set, which has a telephone range of 70 miles when 200-ft. high aerial masts are used, and a c.w. telegraph range of 200 miles. It is of the UC1 0.5-kW type, mounted on a cart for field use, the power for the transmitter being obtained from a generator driven by a petrol engine, which is usually carried on a second cart. The 5-valve receiver with two tuning units is on the right.

Arrangements are being made by Imperial Airways, Ltd., for the construction of new wireless stations to serve the Imperial air route to India, says *The Times*. The aeroplanes employed on the service will be within reach of Continental stations throughout their flight to Egypt, and the new stations are being erected between Cairo and Karachi to enable messages to be sent or received at any time during the journey. The aeroplanes are being fitted with the latest design of Marconi aircraft equipment of 150-watt telegraph and telephone transmitters and receivers, which will operate over a range of from 300 to 400 miles. A generator will be used which will give power for the navigation lights, the illumination of the cabins of the aeroplane, and the working of the wireless apparatus. In the event of a descent having to be made at an isolated spot it will be possible to communicate with one of the stations, as the aeroplane will have a battery charged by the wind-driven generator during flight, to meet such an emergency. There are already wireless stations along the route, but it is intended that those now being erected shall be of a more permanent character, and they are being equipped by the Marconi Company. Arrangements have been made through the Air Ministry for their erection, and when they are completed the chain of wireless stations from Egypt to India will be Heliopolis, Ismailia, Gaza, Rutbah Wells, Ramadi, Baghdad, Shiabah (Basra), Bushire, Bandar Abbas, Charbar, and Karachi.

A number of Antarctic whalers have been fitted this season with Marconi wireless-telephone apparatus, which has enabled them to spread further afield and to adopt tactics which would be impossible without this means of inter-communication; by means of a simple system of code words, the vital information in any message can be kept secret from any other ships that may be within range. The Marconi ½-kW telephone sets fitted to all the ships of the Southern Whaling and Sealing Co., Ltd., and to other whaling fleets, have been specially designed for this class of work; they are operated by a stout lever which can be easily manipulated, even when the hands are heavily gloved, and the apparatus is enclosed in a steel case which renders it practically undamageable. Reception is by loud-speaker, so that there is no need to remove head coverings in order to use the telephone. One ship has heard another 2,000 miles away, but normally communication is maintained between whalers and with the whaling station at Stroemness, South Georgia, up to distances of 750 miles. In addition, a number of Antarctic whalers are this season fitted with Marconi direction-finders specially arranged for these small craft. In regions close to the magnetic pole, where much of the whaling is done, the wireless direction-finder, which is entirely independent of the earth's magnetism, has been found invaluable to the whaling vessels.

The Electricity (Supply) Act, 1926.

The "Memorandum on the Provisions of the Act," briefly mentioned in our last issue (H.M. Stationery Office, price 3d. net), has been prepared by the Electricity Commissioners for the information and assistance of authorised undertakers; it is in effect an abridged translation of the phraseology of the Act into plain language, grouping the various matters dealt with under appropriate headings, with marginal references to the scattered Sections from which the particulars are derived. By this means the provisions are brought into proper perspective, and a coherent impression of the powers, duties, and obligations of the Central Electricity Board, the owners of stations, authorised undertakers, joint electricity authorities, and power companies respectively can be readily obtained; but the Memorandum does not purport to give an interpretation of the provisions of the Act.

Anyone who is concerned with the working of the Act in any way, or who desires to make a quick survey of its contents, will do well to procure a copy of the pamphlet.

Educational.

Northampton Polytechnic Institute.—A course of four lectures on "Power Station Chemistry" will be given by Mr. W. S. Patterson on Friday evenings, commencing March 18th, at 7.15 p.m. Admission free. (See our advertisement pages to-day.)

The Raising of a Coal Bunker After Subsidence.

On Monday last a paper was read before the Society of Engineers (Inc.) by Mr. M. E. Gerard, M.Soc.C.E. (France), describing how a bunker, weighing 1,600 tons, and designed to hold 1,250 tons of coal, was raised to its original level, after a settlement of 7 ft. at one end, and was successfully reinstated upon new foundations. Temporary trestles of ferro-concrete were erected, from which to lift the structure by means of twenty-four 150-ton hydraulic jacks. An elaborate arrangement of packing was devised to enable the jacks to travel up step by step as the bunker was raised. Lifting proceeded according to a carefully arranged programme. A large number of men were engaged in the process—one man to each jack, and others to pack up under the bunker as it was raised. Each man had to be trained for his special work, and great discipline had to be observed during the operation. After the bunker had been raised to its original position the new founda-

tions were completed with new columns built up to meet the stumps of the old columns. The raised bunker has now been in full work for about three years.

Birmingham and Electricity Development.

The following appeared in the *Birmingham Post* of March 4th :—When the proposals for a unified electricity scheme were first outlined it was foreseen that a rigid application at the outset of a uniform periodicity must involve serious disturbance of trade in those districts where existing systems were not in accord with the chosen standard. The consensus of opinion was in favour of the 50 frequency which has been adopted in the larger proportion of undertakings under the independent development of the past. In the Birmingham area a 25 frequency applies, and it is stated by experts who are in the best position to judge, that to alter it at once to a 50 frequency would involve a direct outlay of millions of money and heavy losses through interruption of trade. It is evident that the representations made on this aspect of the Government's scheme have impressed those authorities who started with the premise that a uniform frequency was an indispensable principle, and who still hold that view.

The surrender of this position must not be inferred from the announcement made in Birmingham the other night that assent has been given to the perpetuation of the 25 frequency in the great generating station at Hams Hall which Birmingham is about to add to its equipment. The Electricity Commissioners have their hands too full with the problem of development in other parts of the Kingdom to give attention to the Midlands yet awhile. Far-sighted plans have been made in Birmingham, for the progress of the electrification of industry and other services. If the rate of development is to be maintained, the equipment of the Hams Hall station must be put in hand forthwith, or the municipality will find itself without adequate resources for the prosecution of its plans within the next year or two. It is in these circumstances that assent has been given to the installation of plant being proceeded with. No decision has been arrived at with regard to the larger question of unification. As has been pointed out before, there is no imperative reason why differential frequencies should not still exist side by side as they have in the past. If unification is the ultimate aim, the conversion to standard of those local systems which do not now conform to it may be accomplished at far less expense and inconvenience as existing plants reach the end of their economic life. The equipment of Hams Hall and its connections on a 25 periodicity would not conflict with such a policy, and this consideration has probably carried a good deal of weight with the central authority.

The Birmingham electricity supply is now stretching out into the coalfield across the north-eastern borders of the municipality. A seven miles line carries the current to the new pit, which is to be sunk at Hurley. In co-operating in the work of colliery development the department has entered upon a new and pregnant sphere.

National Institute of Industrial Psychology.

The annual report of this Institute for the year 1926 was presented at the annual meeting of members on Wednesday last week; it shows an increased revenue from investigations, and an increase of membership from 665 to 984—49 per cent. In every direction the activities of the Institute have expanded to an unprecedented degree. Twenty-two investigations for private firms were carried out, besides many shorter surveys, with great satisfaction to the clients, as well as to their employés, who cordially recognise the benefits that they derive from the work. The rapidly growing demands on the educational and clerical work of the Institute have necessitated an addition to the staff of 25 per cent., and increased accommodation is urgently needed. Many instances of increased output, economy of space, and improved working conditions in factories and offices are cited, resulting from the Institute's recommendations. New tests in connection with vocational selection have been devised, and favourable reports have been received. An experiment in vocational guidance which has been in progress for some years has been continued, and 600 children have been examined and advised as to the work they are fitted for; many of these cases have been followed up, to observe the results, which have proved very satisfactory. Various special researches are also in progress. The income was £11,519, and the expenditure £11,399. The appeal fund amounted to £18,054, and donations and subscriptions to £2,571.

Institute of Wireless Technology.

At the February meeting of the Institute a paper entitled "A New Loud-speaker" was read by Mr. H. W. Gambrell, A.M.I.E.E., and was followed by a demonstration of the R-K loud-speaker; reproduction was of very high quality, particularly in the lower frequencies, and it was obvious that this instrument was a great advance in loud-speaker design.

Royal Institution.

On Tuesday, March 15th, at 5.15 p.m., Dr. G. Shearer begins a course of two lectures on "X-rays and the Chemical Molecule"; on Thursday, March 17th, at the same hour, Dr. Guild delivers the first of two lectures on "Colour Measurement"; and on Saturday, March 19th, at three o'clock, Sir Ernest Rutherford will commence a course of four lectures on the "Alpha Rays and Atomic Structure." The Friday evening discourse on March 25th will be delivered by Dr. C. T. R. Wilson on "Thunderclouds."

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.

The staff of the Sun Electrical Co., Ltd., and a number of guests, met at a dinner at the Hotel Cecil on Friday last to celebrate the completion of 25 years in a managerial capacity by Mr. A. G. Beaver. Mr. J. J. Rawlings (director) presided in the absence, through ill-health, of the chairman (Mr. R. Tweedy Smith), and read a letter from the latter expressing his great regret at being unable to attend. In proposing the health of the guest of the evening, Mr. Rawlings said that Mr. Beaver joined the Sun Company at its inception 28 years ago, being appointed general manager in 1902. In 1921 he was made managing director, a position which he still held. The speaker paid a tribute to Mr. Beaver's energy, consistency, and calmness, which had brought the company to its present proud position in the electrical industry. He made special reference to Mr. Beaver's activities in Association work. As a token of his co-directors' esteem, he asked Mr. Beaver to

L. C. Smith.] [*London*

Mr. A. G. Beaver.

Managing Director of the Sun Electrical Co., Ltd.

accept an inscribed gold cigarette case for himself and a travelling bag for Mrs. Beaver. Replying to the toast, Mr. Beaver said that during the period in which he had been with the company he had received loyal support from his fellow directors and the whole of the staff. He held that the way to succeed in business was to enjoy it, and he had enjoyed every moment of his time with the Sun Company. There were few directorates which had remained the same so long as that of the company. In a humorous speech, Mr. W. R. Rawlings (director) proposed the toast of the company and conducted his listeners upon an imaginary tour of the premises. The health of "The Staff" was proposed by Mr. Beaver, who said that no one could deal with such a toast with better knowledge than himself. He referred to the long service of many of the staff and paid special tribute to the work of the secretary (Mr. W. J. Rogers), Miss Dewdney, Miss Tickner, and Mr. Weeks. He then made presentations to Messrs. Weeks, Rogers, and Owen, and Miss Tickner, in recognition of their 21 years' service with the company. A special, personal, presentation was made to Miss Dewdney, Mr. Beaver's secretary. Brief acknowledgments were made by the recipients, Mr. Rogers, Junr., replying for his father, who was absent through ill-health. The toast was replied to by Mr. D. M. Fraser, manager of the Leeds branch of the company. After the speeches there was a dance, which the 200 or so guests thoroughly enjoyed.

At a recent meeting of the Blackburn Town Council, it was stated that the electrical engineer (Mr. P. P. WHEELWRIGHT) had asked for a re-consideration of his salary. The Town Clerk was instructed to obtain copies of a return from other electricity undertakings, together with copies of the statistical report on salaries paid to electrical engineers, for consideration at a special meeting.

The Southport Town Council has adopted a recommendation by the Electricity Committee to pay the electrical engineer (Mr. E. MOXON) a salary of £1,550 a year as from April 1st next.

On the unanimous recommendation of the Electricity Committee the Southport Town Council, at a meeting held on March 1st, appointed Mr. W. T. GANN to the position of deputy borough electrical engineer.

A recommendation that the salary of Mr. SEDDON, engineer and manager of the Edinburgh electricity department, should be increased from £1,200 to £1,300, was lost by 31 votes to 25, at a Town Council meeting last week.

The Dover Town Council has increased the salary of Mr. E. H. BOND, general manager of the tramways, from £400 to £425 per annum, as from April 1st next.

Mr. H. A. UTTLEY, M.Sc., M.Inst.C.E., has been appointed resident civil engineer for the Barton Station extensions of the Manchester Electricity Department, in place of Mr. D. E. Laing, who has resigned. Mr. A. HEATON, of the Finance Staff, has been appointed assistant financial controller to fill the vacancy caused by the death of Mr. B. Bennison.

Mr. W. T. TALLENT-BATEMAN having accepted the position of manager for South Africa for Messrs. Ferguson, Pailin, Ltd., left Bombay in December last, where, for the last three years he has been manager for India, Burma, and Ceylon for the company. His address in future will be: c/o Messrs. Ferguson, Pailin, Ltd., P.O. Box 737, Liberal Life Building, Burg Street, Cape Town.

In appreciation of his 25 years' service as manager of the Cheltenham and District Light Railway Co., Mr. H. J. MCCORMICK was recently presented by some of the leading townspeople with a silver gilt loving cup. The presentation was made by the Mayor (Ald. C. H. Margrett), who also presented a turquoise cross to Mrs. McCormick.

Mr. F. W. PURSE, borough electrical engineer of West Ham, has been elected president of the West Ham Rotary Club for the ensuing year.

Mr. P. K. TURNER, head of the Research Department of Burndept Wireless, Ltd., is joining Messrs. Alfred Graham, Ltd., makers of the well-known "Amplion" loud-speaker, as assistant chief engineer. Mr. Turner made his acquaintance with "wireless" in 1911, with Mr. H. Grindell Matthews, and in 1913 he owned, and gave instruction in, the "Irish School of Wireless" in Dublin. During the war he was a wireless officer in the R.F.C. and the R.A.F., arriving at the head of No. 2 Wireless School; afterwards he joined Messrs. Iliffe and Sons, and was editor of the *Wireless Trader*, and of *Experimental Wireless*, until he went to Burndept's in December, 1925.

Obituary.—SENOR M. P. SANTANO.—The death is reported from Madrid of Señor Don Miguel Perez Santano, a well-known Spanish telegraph engineer, and the inventor of many improvements in telegraphy.

MR. W. LEAF.—We regret to record the death of Mr. Walter Leaf, who, in addition to his position of pre-eminence in the banking and business world, was prominently associated with London electricity supply companies. For many years he was chairman of the St. James' and Pall Mall Electric Light Co., Ltd., and deputy chairman of the Central Electric Supply Co., Ltd. He was also a director of the London Power Co. He was 75 years of age.

MR. A. F. HILLS.—The death of Mr. Arnold Frank Hills, of Thames Ironworks and Shipbuilding fame, in his seventieth year is an event which revives many memories of days gone by in the engineering and shipbuilding world. We know of no more striking example in the industrial world of the "triumph of mind over matter," as *The Times* describes the remarkable way in which he overcame his physical disabilities. In his University days he was a notable athlete, but later a serious illness left him "a hopeless cripple, tied to his bed-chair, unable to move a limb without help." Yet though permanently in this state of physical helplessness, his mind remained vigorous and active, and he devoted his thought to the affairs of the business, its serious problems, the well-being of the company's employés, and so on. He struggled hard to continue the activities of the Thames Ironworks Co., and for some years an electrical manufacturing department was conducted, but eventually he had to close the works down. He was a man of strong convictions and original and independent in his attitude towards industrial problems—he was one of the first to try profit sharing—but we name him here especially for the gallant struggle that he made and for the example of fortitude that should be an inspiration to others who chafe under far less serious disabilities.

MR. A. E. COTTERELL.—The death occurred on March 3rd of Mr. Arthur E. Cotterell, of 34, Manorway, Beckenham, who was until his retirement assistant provincial superintendent for the Midlands of the National Telephone Co. He was in his 62nd year.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies. Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Hertfordshire Rubber Co., Ltd.—Private company. Registered March 3rd. Capital, £15,000 in £1 shares. Objects: To carry on the business of manufacturers of or dealers in rubber and rubber goods and products, rubber substitutes, waste rubber, ebonite, vulcanite and any other plastic substances or compounds made therefrom, &c. The subscribers (each with one share) are:—Joan Peachey, 9, Hetley House, Hetley Road, W.12, stenographer; V. Deighton, 97, Junction Road, Highgate, N.19, solicitor's clerk. The first directors are J. Entwistle (permanent) and others to be appointed by the subscribers. Qualification of first directors, 1 share; of other directors, 250 shares. Solicitors: Arthur Blackman, Hailey & Co., Capel House, New Broad Street, E.C.2.

H. J. Bartlett (Hove), Ltd.—Private company. Registered March 2nd. Capital, £2,000 in £1 shares. Objects: To acquire the business of an electrical engineer and contractor now carried on by H. J. Bartlett at 12, Cross Street, Hove. The permanent directors are:—H. J. Bartlett, 12, Cross Street, Hove; E. L. B C. G. Whitcher, 58, Lansdowne Place, Hove. Qualification, 100 shares. Remuneration as fixed by the company. Manager: H. J. Bartlett. Solicitors: Cockburn, Gostling & Co., 61, Church Road, Hove.

Light-o'-Day Electric Lamp Co. (1927), Ltd.—Private company. Registered March 1st. Capital, £5,000 in 2,000 participating preference shares of £1 and 60,000 ordinary shares of 1s. each. Objects: To acquire the business of applying to electric lamps a lac known as "Oriona Lac," and to adopt an agreement with C. H. Stone. The subscribers (each with one ordinary share) are:—G. E. Byers, 318a, Euston Road, N.W.1, consulting mining engineer; F. H. Edwards, 76, Cheapside, E.C., solicitor. The first directors are:—G. E. Byers, F. H. Edwards, R. P. Wilson, S. Crowther-Smith, and A. C. Peebles. Qualification, £100. Remuneration, £50 each per annum and 7½ per cent. of the net profits in any year after paying the fixed preference dividend of 10 per cent., divided between them. Solicitor: F. Harold Edwards, 76, Cheapside, E.C.2. Registered office: 318a, Euston Road, N.W.1.

Vacuum Lamp Co., Ltd.—Private company. Registered March 3rd. Capital, £500 in £1 shares. Objects: To carry on the business of importers and exporters of and dealers in electric lamps, and wireless and electrical accessories. The first directors are:—Paula Weinmann (Russian, of English origin) and David Weinmann (Swiss), 285, Old Street, E.C. Qualification, 50 shares. Solicitor: V. A. Lyons, 16-17, Devonshire Square, E.C. Registered office: 285, Old Street, E.C.

Transporting Machinery and Engineering Co., Ltd.—Private company. Registered March 3rd. Capital, £25,000 in £1 shares. Objects: To carry on the business of mechanical, electrical, civil, marine, motor and general engineers, contractors, designers and manufacturers of labour-saving and other machinery and appliances, &c. The subscribers (each with one share) are:—S. J. Sulston, 32, Deal Road, S.W.17, incorporated secretary; R. Keedwell, 51, Stembridge Road, Anerley, S.E.20, law clerk. The first directors are not named. Solicitors: Churchill, Clapham & Co., 1, Broad Street Place, E.C. Registered office: Stanley House, Dean Stanley Street, Westminster, S.W.1.

North-Western Wireless Company and Wallasey Motor Exchange, Ltd.—Private company. Registered March 3rd. Capital, £2,500 in £1 shares (1,250 7½ per cent. cumulative preference and 1,250 ordinary). Objects: To acquire the business of radio engineers and manufacturers and motor dealers now carried on by J. H. Guest Cochran at 18, Rullerton Road, Wallasey, as the "North-Western Wireless Company and Wallasey Motor Exchange." The first directors are:—J. H. G. Cochran (permanent), 14, Rullerton Road, Wallasey, Ches.; W. C. Davis, 14, Rullerton Road, Wallasey, Ches. The said J. H. G. Cochran shall be managing director and chairman so long as he holds 100 ordinary shares. Qualification of directors, £1. Remuneration as fixed by the company. Registered office: 18, Rullerton Road, Wallasey, Ches.

Express Magneto (Repairs) and Electrical Co., Ltd.—Private company. Registered March 3rd. Capital, £2,000 in 500 ordinary and 1,500 6 per cent. cumulative preference shares of £1 each. Objects: To acquire the business carried on at Goldcroft, Yeovil, Somerset, as the "Express Magneto" (Repairs) and Electrical Company," and to carry on the business of electrical, wireless and general engineers, manufacturers and repairers of and dealers in electrical and radio apparatus, motors, motor cycles, &c. The first directors are:—J. J. Davis, Milborne Port, Somerset; L. G. Wheeler, Rose Cottage, Yeovil Marsh, Somerset; A. C. Balchin, West Coker Road, Yeovil, Somerset (all permanent, subject to each holding £100 shares). Secretary: A. H. W. Chinnock. Solicitor: A. King, Westminster Bank Chambers, Bridgwater, Somerset. Registered office: Goldcroft, Yeovil, Somerset.

Flexible Electric Cords, Ltd.—Private company. Registered February 24th. Capital £1,000 in £1 shares. To carry on the business of electrical engineers, manufacturers of wireless cables, and other apparatus connected with wireless telegraphy, manufacturers of, agents for and dealers in flexible electric cords, electric wire manufacturers, &c. The first directors are:—C. V. Matthews, 172a, Lea Road, Wolverhampton, solicitor; F. Kniveton, Astley House, 138, Southbury Road, Enfield Town, N., electrical engineer. Qualification, one share. Solicitor: C. V. Matthews, 172a, Lea Road, Wolverhampton. Registered office: Queensway, Ponders End, Middlesex.

Anderson & Stuart, Ltd.—Private company. Registered February 25th. Capital £1,000 in 250 10 per cent. preference and 750 ordinary shares of £1 each. Objects: To carry on the business of installers and suppliers of materials, apparatus and appliances for wireless telephonic, telegraphic and other telephonic, electrical, magnetic, galvanic, mechanical, and other apparatus and appliances, &c. The permanent directors are:—G. A. Anderson (chairman), 31, Greencroft Gardens, Hampstead, N.W.6 (director and secretary of Gil-Ray Trading Corporation, Ltd.); Eleanor M. Stuart, 21, Milton Road, Weston-super-Mare, Somerset; A. C. Gilmour, 42, Bacon Lane, Roe Green, Kingsbury, N.W.9 (director of Gil-Ray Trading Corporation, Ltd.). Qualification, £50 shares. Secretary: A. C. Gilmour. Solicitors: Baxter & Co., 12, Victoria Street, S.W.1. Registered office: Sicilian House, Sicilian Avenue, W.C.1.

Gillan Radio-Electric, Ltd.—Private company. Registered February 28th. Capital, £2,000 in £1 shares. Objects: To carry on the business of manufacturers of and wholesale and retail dealers in wireless apparatus and component parts, &c. The first directors are:—W. Greenwood, 40, Hertford Avenue, East Sheen, Surrey; Mrs. Janet M. Greenwood, 40, Hertford Avenue, East Sheen, Surrey. Qualification, £10 shares. Solicitors and registered office: Reid, Sharman & Co., 36, Bedford Row, W.C.1.

Amalgamated Lamp Companies (Great Britain), Ltd.—Private company. Registered February 28th. Capital, £600 in £1 shares (300 5 per cent. cumulative preference and 300 ordinary). Objects: To carry on business as agents and factors for electrical equipment and similar goods, &c. The directors are:—Miss G. M. Cuthbert, 85, Alexandra Road, Hampstead, N.W.8; H. Feneron, Rosslyn, Wraysbury Road, Staines, electrical agent (both permanent, subject to each holding 300 preference or ordinary shares). Solicitor: E. V. Miles, 30, Theobalds Road, Bedford Row, W.C. Registered office: 14, Moorgate Chambers, Finsbury Pavement, E.C.2.

Midways Electric, Ltd.—Private company. Registered February 28th. Capital, £500 in 400 7 per cent. cumulative preference and 100 ordinary shares of £1 each. Objects: To acquire the business of electrical engineers and contractors now carried on by W. E. Burton as "Midways Electric," at 10, Gees Court, Oxford Street, W. The subscribers (each with one share) are:—G. T. Heard, 23, Harewood Road, Colliers Wood, S.W.19, solicitor's managing clerk; F. G. Buckland, 49, Lavender Avenue, Mitcham, Surrey, solicitor's clerk. The directors are: W. E. Burton and R. P. Atwood. Solicitors: Perowne & Co., 7, Great James Street, W.C.1.

Takato & Co., Ltd.—Particulars of this company were filed on March 1st. The capital is 3,000,000 yen in 50-yen shares. The company was incorporated in Tokio on July 26th, 1925, to carry on the business of sellers, agents, and transporters of electrical, steam, hydraulic, gas and oil machinery, apparatus and instruments, iron, steel, and all other metals, &c. The British address is 282, Dashwood House, 69, Old Broad Street, E.C., where R. H. Webb and A. E. Danvers are authorised to accept service of process and notices on behalf of the company.

Official Returns of Electrical Companies.

Neutron, Ltd.—H. Hackett, 448, Strand, W.C.2, ceased to act as receiver or manager on February 21st, 1927.

Re-Echo Radio Co., Ltd.—C. H. Whatley, 6-7, Charing Cross Chambers, Duke Street, Adelphi, W.C.2, ceased to act as receiver or manager on February 21st, 1927.

Eunice Wireless Cabinet Works, Ltd.—Issue on February 21st, 1927, of £200 debentures, part of a series.

Cark and District Electricity Co., Ltd.—Particulars filed of £1,000 debentures authorised February 4th, 1927, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Newton Brothers (Derby), Ltd.—Particulars filed of £75,000 debentures authorised January 1st and covered by trust deed dated February 14th, 1927, charged on land and buildings in Alfreton Road, Derby, and fixed plant and the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £30,000. Trustees: Midland Bank Executor and Trustee Co., Ltd.

Cleveland and Durham Electric Power, Ltd.—Satisfaction to the extent of £11,300 on various dates between February 4th, 1926, and February 19th, 1927, of debentures secured by trust deed dated October 6th, 1913, and supplemental trust deed dated December 31st, 1918, securing £250,000.

Radio Accessories, Ltd.—Debenture dated February 10th, 1927, to secure all sums of money as may be owing to the chargees on June 30th, 1929, or on such earlier date as the principal moneys become due under the debentures on the balance of the company's loan and current account with the chargees or in respect of loan and current accounts due by the company to such chargees or in any other manner whatsoever, charged on the company's undertaking and property, present and future, including any uncalled capital. Holders: Burndept Wireless, Ltd., Eastnor House, Blackheath, S.E.3.

Attaix, Ltd.—Satisfaction in full on February 1st, 1927, of debentures dated February 10th and July 2nd, 1926, each securing all moneys not exceeding £500.

S. Kalisky (Aldgate), Ltd.—Debenture dated February 1st, 1927, to secure £4,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: S. Kalisky, Ltd., 43, Bidder Street, E.

Nox Electric Lamp Co., Ltd. (189,377).—Capital, £2,000 in £1 shares. Return dated December 31st, 1926. 502 shares taken up. £2 paid. £500 considered as paid. Mortgages and charges: Debenture for £662 13s. 4d.

Walker, MacEwen & Co., Ltd.—E. L. Holford, of 41, Nightingale Lane, Wanstead, E.11, ceased to act as receiver on February 8th, 1927.

City Notes.

Marconi's Wireless Telegraph Co., Ltd.

The report of the committee appointed to investigate the company's affairs was issued last week. The directors' report for 1926 was published a day or two later, and as this embraces the committee's recommendations, it will be sufficient to deal with the directors' statement. It is shown that although over £3,000,000 was taken from reserves in 1923 and 1924 for the purpose of writing down sundry assets, it was found in May last year that further heavy writing down was necessary. To ensure that this operation would be final, Sir Gilbert Garnsey and the company's auditors, Messrs. Cooper Bros. & Co., were asked to investigate the company's affairs. Their report shows that after taking into account the trading profit, less the preference dividend, for 1925, additional provisions should be made to the extent of £2,766,168 in respect of:—Advances to associated companies, which have become bad (£1,059,623); writing down of share holdings in associated companies (£772,623); obsolescence of plant due to the adoption of the "beam" system (£373,856); further reserve to meet depreciation of the company's holdings in foreign currencies, &c. (£275,690); and provision for claims and expenses arising out of the Argentine law suit (£237,955). Following these recommendations, the directors have decided to write down patents and patent rights to £1, and to transfer the balance to general reserve. After transferring the balance of the general reserve and the credit balance from 1924, making

together £1,140,374, there remains a deficiency of £1,625,794. Following the Committee's advice, the directors have decided to recommend a reduction of 10s. per share in the ordinary capital (*i.e.*, from £2,374,954 to £1,187,477). The capital will subsequently be restored to £4,000,000 by the creation of 3,250,092 new shares of 10s. each. If these recommendations are approved, the directors will be able to recommend a dividend out of the profits of 1926 when the accounts are available. During the last two years the policy of the management has been to wind up all non-wireless companies which had no reasonable chance of earning profits; to reorganise those companies which had profit-earning possibilities with a view to their disposal; to concentrate the manufacture and sale of broadcasting material in one company; to construct "beam" stations and modernise existing stations; to secure from the Government a general licence to establish telegraph services throughout the world; and to improve relations with Government departments. At the beginning of 1925 the company had interests in 56 other companies. Twelve of these had no connection with the wireless business, and nine of them have been liquidated, while the other three have been reorganised for disposal, and are either making a small profit or balancing their accounts. Five other companies were dormant, and have since been wound up. Three companies making broadcasting apparatus have been amalgamated, and last year made a substantial profit. The company's claim against the Government for the use of patents during the war has not yet been settled; progress has been made in arbitration regarding this matter. During the past four years the company's net revenue from patent royalties has shown a satisfactory increase. The "beam" system is being continually improved and developed. The Canadian station has been handed over; the Australian station has passed tests satisfactorily; and it is hoped to open the South African and Indian services during the next three months, and the North and South American services during the coming summer. These services should all prove remunerative to the company. The report proceeds to review other developments, and mentions the formation of an Egyptian subsidiary to conduct radiotelegraphic services between Egypt and other countries; the inauguration of further services by the Portuguese company; the contract for the administration by the company of the Peruvian postal and telegraphic services; a similar arrangement in Bolivia; a contract for the erection of radio stations in Venezuela; and the development of a system of *fac simile* transmission. Improvement in the company's relations with Government departments is reported, and mention is made of the general licence received in 1925 to establish services with all extra-European countries and Austria, Bulgaria, Denmark, Finland, Greece, Portugal, Russia, Spain, Sweden, Switzerland, Turkey and Jugo-Slavia. Senatore Marconi has expressed a desire to be relieved of his work as chairman of the company to permit him to devote more time to the technical side. It is accordingly proposed to accede to this desire, and to appoint Senatore Marconi president of the company. The following gentlemen have been invited to join the board:—Lord Inverforth, P.C., Major-General Sir Frederick Sykes, G.B.E., M.P., Lord Wester Wemyss, G.C.B., Sir Charles C. Barrie, K.B.E., and Mr. F. R. S. Balfour, D.L., and it is suggested that Lord St. Davids shall be appointed chairman. The following directors have intimated their willingness to resign:—Mr. H. W. Allen, Sir Frederick J. Barthorpe, Lord Herschell, Sir Wm. Slingo, and Mr. S. St. J. Steadman. The necessary resolutions for the reduction and subsequent increase of the capital and for the appointment of Senatore Marconi as president will be submitted at the annual meeting to be held on March 15th.

The directors point out that although the authorised capital is to be raised to £4,000,000, there is no intention of making any new issue until the development of the company's business warrants it.

Midland Counties Electric Supply Co., Ltd.

The annual meeting was held on March 1st. Mr. G. Balfour, M.P. (chairman), who presided, said that when they reviewed the difficulties with which they were faced during the year, in common with all concerned with public services, they could be satisfied with the results that had been obtained. The aggregate number of miles run by the tramway cars and motor-buses during the year was practically the same as in the previous year, but the number of passengers decreased, some unremunerative services having been cancelled. Better results would be obtained if only a reasonable number of vehicles were allowed to run; the public would still be properly catered for, and the business would be remunerative. They hoped by degrees to make the transport branch a paying one; it represented about 12 per cent. of the company's resources. In the supply of electricity steady progress had been maintained, although full benefit had been denied them on account of the industrial troubles. The amount of energy sold had increased by 22 per cent. to 73,565,000 kWh, and 2,709 consumers had been added, making a total of 11,366. The connected load of the various operating companies had increased by 13,480 kW to 67,720 kW; the maximum load had risen to 28,640 kW. Arrangements were being made for the installation of another 12,000-kW turbo-alternator with the necessary boiler plant, &c., at the Spondon station, and additional boiler plant at the Avon station. In a few months the work of connecting the Avon, Hinckley and Spondon stations by 33,000-V lines would be completed. The lines would be in duplicate and 53 miles long. During the year 92 miles of h.p. lines and 64 miles of l.p. cables had been installed, making the respective totals 430 and 250 miles. Supplies of electricity were inaugurated in three urban districts and 19 parishes during the year and bulk supplies to Coventry, Mansfield and Newark were commenced. The company was now supplying in three boroughs, 22 urban districts, and 50 parishes in rural districts, in addition to bulk supplies to five local authorities. The Leicestershire and Warwickshire Company's Bill received the Royal Assent in June last, and Special Orders were obtained by the Derbyshire and Notts. Company for Shardlow and Bakewell. A Special Order was also obtained by the Leamington and Warwick Electrical Co. for the areas south of Warwick. As soon as lines were extended Special Orders were applied for, and four applications were now being considered. Mr. Balfour expressed the company's intention to do what it could to facilitate the operation of the new Electricity (Supply) Act. He doubted whether the Act would effect the anticipated economy; it was not its effect upon the companies but upon the public and the policy involved, which he believed to be wrong. After referring to the success of the issue of preference shares during the year, he said that the results during the first two months of the current year had justified their best expectations.

London and Suburban Traction Co., Ltd.

The annual meeting was held last week, Lord Ashfield (chairman) presiding. In presenting the report (*vide* our last issue, p. 356), the chairman pointed out that the company's income was derived from three sources—tramways, motor-omnibuses, and electricity supply. Although their tramway investments at £1,658,000 represented 75 per cent. of the whole, they had received nothing from that source for 1926. Until the tramways could be restored to a state of moderate prosperity, the shareholders were not likely to receive a return upon their investments. The traffic receipts of the combined tramways had fallen by £20,000. The Metropolitan Electric Tramways failed, by £3,844, to meet its bare working expenses. The company's lease expired in 1930, and it had intimated to the Middlesex County Council that unless there was a drastic change in the circumstances under which tramways operated it could not entertain a renewal of the lease. Since 1922 the competition of motor-'buses had increased by 437 per cent. He (the chairman) hoped that before the expiry of the lease practical steps would have been taken to relieve the tramways of that wasteful and injurious competition. Such improvements as there were during the year occurred on the Uxbridge Road route of the London United Tramways system and the development of housing in the area served by the South Metropolitan Electric Tramways. The Ministry of Transport had restricted the number of omnibuses on the Uxbridge Road, and the L.U.T. had consequently been able to improve its stock and provide a good service for the public, which was duly appreciated. By the adoption of similar methods on other routes, both the companies and the public would secure advantages. The tramways laboured under onerous burdens which should be shared by their competitors. If the Government honoured its pledge to relieve the tramways from wasteful and uneconomic competition he had no doubt that they would again achieve prosperity. The report and accounts were adopted.

Scottish Power Co., Ltd.

The annual meeting was held in Edinburgh on February 28th. Mr. G. Balfour, M.P., who presided, said that the trading results for the past year were satisfactory in view of the circumstances. For the first four months of the year the demand showed a 10 per cent. increase, but then the coal dispute supervened. Their total receipts had nevertheless risen from £117,332 to £133,184; that result was due partly to normal progress in domestic and small power supplies, and to a greater degree to temporary arrangements with collieries for supplies. The operating costs were substantially increased, but owing to their policy of early securing options upon colliery stocks, they had not had to fall back on foreign coal, which was inferior and high-priced. The nature and extent of the company's load, apart from normal expansion, justified their confidence that the improvement in trade which was anticipated would immediately be reflected in the trading results. A Special Order had been obtained during the year, and the company was therefore now able to give lighting as well as power supplies throughout the whole area, with the exception of one or two small burghs which already had their own undertakings. Arrangements had been made to link up with the Fife Electric Power Co., and the construction of the trunk line was now proceeding and would be completed shortly. The company had made similar arrangements with the Grampian Co. The purchase for £93,860 of the Alloa undertaking by the Scottish Central Co. would prove a satisfactory addition to the company's assets. An issue of capital was to be made to repay the money borrowed for this and other purposes. As the authorised capital was already fully issued, the shareholders would be asked later in the year to sanction an increase. The chairman made brief reference to the Electricity (Supply) Act, 1926, and then reviewed the financial results, which were summarised in our issue of February 25th (p. 313).

North Metropolitan Electric Power Supply Co.

Presiding at the annual meeting last week, Sir James Devonshire, K.B.E. (chairman) said that the company, to a considerable extent, had escaped the effects of the industrial depression, although the output and revenue had been affected. No increase had been made in the charges to their 30,000 domestic consumers on account of the coal dispute. Other matters which had an effect upon the revenue, as compared with 1925, were the closing of the British Empire Exhibition and the reduction of the rates for energy supplied to the Metropolitan Electric Tramways. Notwithstanding this, the same dividend had been paid upon a larger capital. The total expenditure of the company had been brought to £3,100,000 by the expenditure during the year of over £500,000, chiefly upon mains and sub-stations. The demand for electricity from the public was as great as ever, but it was small at present compared with what it would become in the near future when electricity was adopted for all domestic purposes. Already there was a tendency in that direction, and that would be encouraged by a method of charge consisting of a fixed rate to cover standing charges combined with a low "unit" rate. Although the balance from working was £25,000 lower, they had been able to declare the same dividends and carry an increased amount forward. Referring to the construction of the Brimsdown station, the chairman said that the initial installation would consist of two 25,000-kW sets, but the ultimate capacity would be 150,000 kW. During the construction period the debenture interest would be paid by the Construction Company out of revenue. As soon as the station commenced operation a rental would be paid by the Power Company to the Construction Company, and this would, generally speaking, meet the latter's debenture interest and sinking fund. The report and accounts were approved.

Underground Electric Railways Co. of London, Ltd.

The report for the year ended December 31st last shows traffic receipts amounting to £804,113, to which are added miscellaneous receipts of £5,975, making £810,088—an increase of £69,643, as compared with 1925. The net receipts at £749,301 were £71,235 higher. After deducting interest and adding £145,959 brought forward there was a balance of £241,054. From this £8,929 is deducted for the payment of 8,929 ordinary shares in accordance with the scheme for the reorganisation of the capital, and the cost of this scheme, £11,000, leaving £221,125. It is proposed to pay a dividend of 1½ per cent. on the ordinary shares, which will leave £145,092 to be carried forward. Reference is made to the reorganisation, and it is noted that the capital of the company now consists of 5,068,878 ordinary shares of £1 each. The investments were increased during the year by purchases of London General Omnibus and North Metropolitan ordinary shares. The results of the subsidiary companies are reviewed (*vide* Electrical Review, February 25th, p. 311), and the deaths of Lord Stuart of Wortley, and the resignation of Lord George Hamilton are recorded. During the year Brig.-Gen. A. M. Asquith, D.S.O., and Messrs. S. B. Joel, G. Leith, C.B.E., and E. R. Peacock were appointed to the board. The meeting is to be held on March 15th.

Mather & Platt, Ltd.

Mr. L. E. Mather (chairman) presided at the annual meeting on February 28th, and in presenting the report pointed out that the past year's profit was only slightly below the average for the two preceding years. Having regard to the troublesome times which had been experienced, they were thankful that such success had been attained. The directors had no hesitation in recommending the same dividend and bonus as for 1925. During the year the number of employés had been kept constant, and the output per man-hour had been maintained. The volume of orders was materially affected by the coal dispute and some were taken with a very small margin of profit, but they were not pessimistic. There were signs of revival in the cotton trade, and the collieries were beginning to make inquiries for electrical and pumping plant. Municipal contracts for extensions to electricity and pumping stations continued to be placed, but there was keen competition. Overseas trade had been disappointing, with one or two exceptions, but that was all the more reason for anticipating better times. Their French company had done well. Machinery was being supplied to Russia, and all payments had been made as they fell due. They were prepared to take further contracts on a similar basis, but the existing economic and political situation in Russia made it difficult to obtain further business on satisfactory terms.

Electrical Distribution of Yorkshire, Ltd.

The annual meeting was held in Leeds on March 1st. Mr. R. W. Wickham (chairman) presided, and in moving the adoption of the report and accounts (Elec. Rev., February 25th, p. 312) said that in spite of an increase of £12,000 in the cost of energy, through the coal dispute, they had made further reductions in their prices, had met new capital charges amounting to £17,000, had added £10,000 to the reserve fund, and had increased the balance carried forward by £1,500—a very gratifying result. The company was now the authorised distributor under 36 Electricity Orders covering an area of 960 square miles. When the company's outstanding applications had been dealt with, a supply of electricity for lighting purposes would be available in practically the whole of the industrial area of Yorkshire south of the River Wharfe. That marked the end of their original scheme, and they had broken new ground by making an application in respect of Ripon and district. There had been a steady growth in the use of electricity for street lighting, and the company now had agreements with a number of local authorities. The greatest development which had occurred during the year was in the direction of domestic supplies; the majority of the houses now being built were being wired for electric lighting, and provision was usually made for other apparatus. That development had been encouraged by the introduction of a two-part tariff. The board had under consideration a wiring scheme by which the installation would be paid for by a small addition to the price of energy. Supply to new housing estates through prepayment meters was growing. To meet those developments more capital was required, and in a few days the shareholders would be offered an issue of 300,000 new shares. Those shares would be offered in the proportion of three to every five held, and the price would be 25s. Mr. Wickham did not anticipate that the new Electricity Act would have any adverse effect upon the company.

Liverpool Overhead Railway Co.

The traffic receipts for the past year amounted to £83,997, and miscellaneous receipts to £5,289, making £89,286. Against this were charged working expenses £87,749, renewal fund £5,000, and contingent fund £400, leaving a deficit of £3,864. After meeting debenture interest this deficit is increased to £10,619, but against it are placed balance of compensation under the Railways Act, 1921, and the balance brought forward from 1925, reducing it to £3,069. The number of passengers carried fell from 7,896,572 to 7,006,230. There is stated to be little hope of material improvement in the company's prospects until trade revives. The report records the death of Col. H. Concanon and the resignation (on account of the pressure of official duties) of the Lord Mayor, Mr. H. C. Bowring. Their places on the board have been filled by Messrs. E. B. Orme and G. T. Phizackerley. The company's general manager and engineer, Mr. E. J. Neachell, has resigned owing to ill-health, and Mr. W. T. D. Grundy has been appointed to the position.

Stock Exchange Notices.

The undermentioned have been ordered to be officially quoted:—

Auckland Electric Power Board.—£250,000 5 per cent. water power conversion and general extension purposes debentures, Nos. 1 to 2,500 (£100) bearer.

Madras Electric Supply Corporation.—110,000 ordinary shares of £1 each, fully paid, Nos. 326,801 to 436,800.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

Adelaide Electric Supply Co., Ltd.—250,000 new 6½ per cent. "C" cumulative preference shares of £1 each, partly paid and fully paid, Nos. 500,001 to 750,000 (ex dividend).

North Metropolitan Electric Power Supply Co.—850,000 ordinary shares of £1 each, fully paid, Nos. 1 to 850,000 (ex dividend).

Torquay Tramways Co., Ltd.

In the course of his speech at the recent annual meeting, the chairman (Mr. H. T. Barnett) said that up to July last matters looked very bad, but from that month onwards there was a marked recovery, and by the end of the year the traffic revenue was greater than that of 1925. The company had come to an arrangement with its omnibus competitors upon the Torbay road, which had resulted in improvement for both parties. The Babbacombe Cliff Light Railway was opened on April 1st, and the results had exceeded all expectations. Their subsidiary, the Devon General Omnibus and Touring Co., Ltd., had maintained its progress. It was not, however, intended that that company should declare a dividend on its ordinary capital until the reserve fund had been built up.

Isle of Thanet Electric Supply Co., Ltd.

The report for the year ended December 31st last shows a revenue of £151,167 and net income of £59,778. After meeting debenture interest and sinking fund and transferring £25,000 to reserve, and crediting interest (£519) and the balance brought forward (£3,504), there remains £23,800. The preference dividend is paid and one of 3 per cent. declared on the ordinary shares, leaving £3,460 to be carried forward. Although the coal dispute adversely affected the receipts, they were £13,176 in advance of the 1925 figure, while the expenses rose by £5,650. In March, 1926, an issue of 72,000 preference shares of £1 each was fully taken up by existing shareholders. The meeting was to be held on Wednesday last.

Mansfield and District Tramways, Ltd.

The profit for the past year was £5,039, and to this is added £1,148 brought forward, making £6,187. A balance of £2,608 remains after meeting loan and debenture interest, and £4,011 is taken from the contingency reserve, making £6,620. Of this £6,605 is put to debenture stock redemption funds, leaving £15 to be carried forward. In 1925 the preference dividend was paid and the ordinary shares received 5

per cent. The adverse result is, of course, due to the coal dispute, and the directors state that some time must elapse before conditions become normal.

Cambridge Electric Supply Co., Ltd.

The accounts for the past year show a profit of £35,361, to which is added £5,097 brought forward, making £40,458. After meeting debenture interest and taxation and transferring £10,000 to depreciation fund, £10,000 to reserve, and £1,500 to pension fund, there remains a balance of £11,905. It is proposed to pay a dividend of 7 per cent., leaving £4,905 to be carried forward. During the year a new Babcock & Wilcox boiler was installed, and the total capital expenditure was £22,283.

Llanelly and District Electric Supply Co., Ltd.

The profit for the last year, including £998 brought forward, was £31,546. After meeting debenture interest, &c., and allocating £2,500 to renewals reserve, the preference dividend is paid and £1,189 is carried forward. For 1925 a dividend of 5 per cent. was paid on the ordinary shares; last year the undertaking was very badly affected by the coal dispute, the net profit falling from £23,302 to £14,691. An improvement is recorded for the first two months of the current year.

The Mackay Companies.

The report for the year ended December 31st last shows a total income of $4,922,811 and an expenditure of $296,640, leaving a surplus of $4,626,171, which is added to the surplus brought forward, making $6,771,512. After paying dividends of 4 per cent. on the preferred and 7 per cent. on the common shares, a surplus of $2,160,401 remains. The investments stand at $92,883,716.

Clarke, Chapman & Co., Ltd.

The net profit for the past year was £13,453 (as compared with £33,194 in 1925) and after providing for maintenance charges, depreciation, &c., and adding £2,192 brought forward, there remains £8,135. The directors recommend the payment of the final dividend on the preference shares, but are unable to declare an ordinary dividend. For 1925 the dividend was 5 per cent. A balance of £3,246 is carried forward.

Galashiels and District Electric Supply Co., Ltd.

At the annual meeting on March 4th it was reported that there had been a steady expansion of business, and it would be necessary to extend the power station. The Special Order applied for should be ratified by Parliament within the next few days. It was proposed to increase the share capital from £100,000 to £200,000.

Westminster Electric Supply Corporation, Ltd.

The directors recommend a final dividend at the rate of £5 16s. per cent. upon the ordinary capital as increased by the recent bonus issue. The total dividend represents a return of 14.7 per cent., as compared with 15 per cent. last year.

British Insulated Cables, Ltd.

The directors recommend the payment of a final dividend of 10 per cent. on the ordinary shares, making 15 per cent. for the year. This is paid upon a capital increased in 1925 from £1,000,000 to £1,333,333. £285,000 is allocated to depreciation and reserve, and £271,000 is to be carried forward.

Charing Cross Electricity Supply Co., Ltd.

The directors recommend a final dividend on the ordinary shares of the West End Undertakings at the rate of 9 9/16d. per share. This, with the interim dividend already distributed, makes up the standard dividend for the year, in accordance with the London Electricity (No. 2) Act, 1925.

Vickers, Ltd.

The directors announce the payment of the final dividends upon the 5 per cent. preferred stock (less tax), the 5 per cent. preference shares (less tax), and 2½ per cent. upon the cumulative preference shares (free of tax).

Bournemouth and Poole Electricity Supply Co., Ltd.

The directors recommend the payment of a final dividend of 5½ per cent. upon the ordinary shares, making 10 per cent. for the year, together with a bonus of 4 per cent. free of tax. Last year's distribution was similar.

St. Maurice Power Co.

The total income for the past year was $1,031,379, as compared with $807,000 for 1925. After meeting expenses, rentals, and interest, $170,000 was transferred to reserve, and a balance of $627 was added to surplus, making $983.

Danish Company.

The *Nordisk Kabelfabrik*, Copenhagen, reports net profits of 1,578,000 kr. for 1926, and has declared a dividend at the rate of 5 per cent., as in each of the two previous years.

Globe Telegraph and Trust Co., Ltd.

A quarterly dividend of 2½ per cent. has been declared on the ordinary shares.

Reduction of Capital.

X-RAYS LIMITED AND REDUCED.—A petition for confirming the reduction of the capital of the company from £75,000 to £24,265, has been presented to the High Court, and will be heard in London on March 22nd.

Richmond (Surrey) Electric Light and Power Co., Ltd.

A final dividend of 5 per cent., making 9 per cent. for the year, is recommended on the ordinary shares. Last year the old ordinary shares received 10 per cent.

Northern Mexico Power and Development Co.

A dividend of 1 per cent. has been declared on the common stock and a quarterly dividend of 1¾ per cent. upon the preference stock.

Brazilian Traction, Light and Power Co., Ltd.

A quarterly dividend of 1½ per cent. has been declared on the cumulative preference shares.

Coatbridge and Airdrie Electric Supply Co., Ltd.

The directors recommend a dividend of 9 per cent. on the ordinary shares for the past year.

Western Telegraph Co., Ltd.

The directors have declared the second quarterly interim dividend of 5s. per share, free of tax.

Newcastle and District Electric Lighting Co., Ltd.

The directors recommend a dividend of 7 per cent. for the past year.

W. Canning & Co., Ltd.

A dividend of 10 per cent. and a bonus of 6d. per share are recommended on the ordinary shares for the past year.

Stocks and Shares.

MONDAY EVENING.

STOCK Exchange markets are in a fairly cheerful frame of mind. The Chinese trouble has faded into the background as a factor of disturbance to any markets except the few that are intimately connected with it. The people who, a month ago, were talking "dearer money" have changed their key, and investment stocks show general strength. A recovery in the rubber share market stands out conspicuously.

Reference was made here last week to the growing inclination on the part of holders of London electricity supply shares, to exchange the latter for shares in the big power undertakings. With nothing much to look forward to in the way of possible price appreciation, and with the knowledge of a common 7 per cent. dividend level to be reached after the end of 1931, the proprietor of the London companies' shares is asking whether he cannot obtain wider scope for dividend and profit in the power concerns. No doubt the proprietary of the average London company is composed mainly of investors pure and simple—people who, to use the Stock Exchange phrase, will never sell their shares until they are dead. Their investments are secure, were never more so, in the older electricity supply companies, and this is all they ask. But there are other shareholders who require a more extended prospect, and who turn to the power companies as offering what they, the investors, seek. Several of such shares are quoted in our weekly lists, but it may be of some service to set out in a separate table the principal provincial stocks and shares quoted in the Stock Exchange lists:—

Share.	Divd. %	Price.	Yield. £ s. d.
Clyde Valley ordinary	8	30/-	5 6 8
Do. first preference ...	6	22/-	5 9 1
Do. second preference	8	27/6	5 16 5
Co. Durham Electric Power Dis. debenture	5	87½	5 14 3
Elec. Dis. Yorkshire	8	31/3	5 2 5
Kent Electric Power debenture	4½	80½	5 11 10
Lancashire Elec. Light & Power ordinary	7½	24/6	6 2 5
Do. first preference ...	6	26/6	4 10 7
Do. second preference	7	26/6	5 5 8
Midland Counties Elec. ordinary	6	22/-	5 9 1
Newcastle-on-Tyne Elec. ord. ...	7	22/-	6 7 3
Scottish Power ordinary	8	25/-	6 8 0
Shropshire, Worcs. & Staffs. "A"	8	27/6	5 16 5
Do. "B"	6	23/6	5 2 2
Do. preference	6	22/-	5 9 1
South Wales Power preference	6½	17/6	7 8 7
Do. debenture	6	100½	5 19 5
Yorkshire Electric ordinary ...	8	29/6	5 8 6
Do. preference ...	6	23/-	5 4 4
Do. debenture ...	5½	101	5 9 0

The dividend on Lancashire Electric first preference is paid tax free and the company's 7 per cent. preference carry participating rights.

While the list of London electricity supply shares remains very firm as to its prices, the provincial group shows increasing strength. There are small rises in Clyde Valley, Midland Counties, Newcastle-on-Tyne and Lancashire Light and Power. Amongst the supply companies, Bournemouth and Poole has declared a final dividend of 5½ per cent., less tax, making 10 per cent., plus a bonus of 4 per cent., tax free, the same as last year. The price of the shares is unchanged at 60s. 9d. Isle of Thanet Electric Supply has raised its dividend by ½ per cent. to 3 per cent., and the figures in the report tell of satisfactory progress. The price of the ordinary shares is 16s.; the 6 per cent. preference are quoted at a guinea. The Richmond (Surrey) Electric Light and Power final dividend of 5 per cent. makes 9 per cent. for the year on the ordinary shares, standing at 30s. 9d.

The Westminster Electric final dividend for 1926 is declared on the capital as increased by the new shares issued at the end of last year through capitalisation of the company's reserves. The dividend is 5.8 per cent. on the whole capital, and makes 8.8 per cent. for the full year. This is equal to 14.7 per cent. on the capital before the latter was increased, and it goes against 15 per cent. paid for 1925. The yield on the shares at the current price of 25s. 6d. is £7 2s. 6d. per cent. now, but, as observed previously, our yield-table is calculated upon the 7 per cent. dividend that will obtain from the beginning of 1932. That this austere method is recognised as being strictly, if not mathematically correct, would seem reasonable to assume in view of the fact that no protest has reached us on the point.

Tube Railway stocks are slightly better on the week, Underground Electric Railways of London £1 shares firmed up to 16s. The company's report, published a few days ago, shows that the Associated Equipment Company enabled the payment of the maiden dividend of 1½ per cent. upon Underground £1 shares. The Associated Equipment contributed £60,000 to the Common Fund, and the dividend on the Underground shares took £76,000. The London & Suburban Traction is the Cinderella of the combine, the company paying nothing to the pool. At the meeting last week, the chairman said that what they needed was a little more fair play: the tramways stood at a disadvantage by having to carry workmen passengers at cheap fares, while its competitors were not subject to the same terms. The shares are a little better at 7s.

United River Plate Telephones are 2s. 6d. down after their big rise, said to be due to American buying for control purposes. International Automatic Telephone deferred, after their dip to 40s., have recovered to 43s. The ordinary have risen to 44s. 6d. Cable stocks present no features of interest. Globe ordinary shed 5s. to 18½. Westerns are unaffected by declaration of the usual quarterly dividend of 5s. per share net. Anglo-American deferred is ⅛ lower at 23⅞.

Foreign traction varieties are better. Anglo-Argentine Tramways preference, of both classes, have made further headway. Brrazilian Tractions went 3½ higher under buying pressure from Brussels, Montreal, and New York. The preferred are up to 116½. Mexican Utilities hold most of the substantial rises recently acquired. The Tramways firsts gained two points to 71½, and the seconds rose to 50½. In the Colonial stocks, British Columbia Electrics are heavy, the deferred going back to 154½, a 3½ points decline. City Services preferred have dropped 4 to 90½. An offer is being made, of 2½ million francs, in 7 per cent. bonds at 97½, by the Société des Forces Electriques de la Vallée de Gavarnie.

The recommendations of the Marconi Board are out at last. They have been so thoroughly canvassed in the Press that their detailed examination here might look out-of-date when these notes appear. Two main points are the proposal to reduce the nominal share value to 10s., by writing off 10s. per share, and the expression of opinion that such action will lead to an early return of Marconis to the dividend list. The English Shareholders' Committee adopted the unusual course of issuing a statement of its own on the eve of the company's announcement. At the moment, it looks as if two camps existed, and that between the two lies more than one gulf. Shareholders will probably be well advised to support the Marconi directors. To job backwards is useless. The future holds promise of success after the bitter lessons of the past. The price of the shares has gone back to 15s., but the writing-off of deadweight capital will make no difference to the market price of Marconi shares. Under reorganised conditions, the Marconi Company should rapidly regain much of the lost ground.

Johnson & Phillips are again the weak spot in the electrical equipment section. The shares are 2s. 6d. lower, following upon a similar drop in the previous week, and the only assumption advanced in explanation is that the dividend may prove disappointing. The announcement is due next month, and will compare with 2s. a year ago. In November, the interim dividend was 1s. per share. British Aluminiums are 9d. better at 47s. Edison 5 per cent. debenture is a point higher at 85. The company's 5½ per cent. second debenture stands at 81.

Babcocks are steady. Vickers have gained a trifle and Armstrongs went up a little upon rumours, denied though these were, that some kind of working agreement might be reached by the two undertakings. A feature in the Miscellaneous Market is a spurt in rubber shares. The produce hardened in price, and the share list responded with an all-round improvement in values, accompanied by a mild outburst of business activity.

The British Industries Fair.—IV.

Proceedings and Exhibits at Birmingham.

THE Fair closed on Friday last amid expressions of satisfaction from the bulk of the exhibitors. The actual business done was substantially in advance of that of previous years, and inquiries which should bring forth fruit in due season were numerous. Our Birmingham correspondent states that, as a result of this year's experience, it is probable that the accommodation at Castle Bromwich will be further increased by next year. It is thought that another building will be erected between the existing buildings "A" and "B," which are at present connected by a long corridor in which serious congestion has taken place.

While it is very difficult to gauge with a high degree of accuracy the extent of the business done, it may be worth while to record the official estimate. This places the value of orders actually obtained at £4,000,000, while the business which is likely to accrue during the next twelve months as the result of the Fair is put at between eighteen and twenty millions. According to the same official source, the branches in which the bulk of the business was done included switchgear, internal-combustion engines, colliery plant, lamp shades, and boiler and engine room plant.

Our own impressions, gathered from exhaustive inquiries at the electrical stands, confirm the optimism thus officially expressed. While, of course, actual figures were not disclosed, practically every company interviewed was pleased with results, and satisfied that its efforts had not been wasted.

One of the leading electrical companies stated that the volume of orders for all departments was satisfactory, the majority being for the home market. There were several important foreign orders and inquiries. Excellent results were reported by a well-known company which makes electric fires; 50 fires were sold in one day, there being many oversea buyers. One switchgear company reported orders from India, and another received promising inquiries from Canada. Another company manufacturing electric fires and other appliances, which is a regular exhibitor at the Fair, considered that this was the best year so far as it was concerned. An electric vehicle firm noted as an interesting point that many small firms made inquiries regarding its products. One of the smaller companies dealing with domestic appliances said that it had done far better than it had hoped to do. A number of good orders and sound inquiries regarding water-heating apparatus were received by another London company of electrical manufacturers. Some makers of electric heating and cooking apparatus said that, although the volume of orders was not very large, a number of inquiries had been received which appeared certain to bring in business from entirely new directions. The foregoing are typical replies to questions put to the exhibitors. Only one firm seemed dissatisfied with results so far as orders were concerned, but even in this case it was admitted that many useful "contacts" had been made.

We are convinced that the Electrical Section of the Fair, at least, has been a success, and we call for the co-operation of British electrical manufacturers in ensuring a continuance of that success.

The Department of Overseas Trade announced last week that the Government intended to repeat its grant of £25,000 for publicity purposes in connection with next year's Fair.

About 90 per cent. of this year's exhibitors have notified their desire to show again next year, and in many cases increased space is required.

THE BIRMINGHAM SECTION.

An Electrical Luncheon.

On March 3rd there was a further concourse of electrical visitors at the Fair. They included delegations from the Incorporated Municipal Electrical Association, the British Electrical Development Association, the Provincial Electric Supply Committee of the United Kingdom, and the Electrical Association for Women. The delegates took lunch at the invitation of the Fair Council.

Mr. T. R. Martin (chairman of the Fair Management Committee), who presided, pointed out that the Fair had doubled its size inside two years.

Mr. W. C. P. Tapper (borough electrical engineer, Stepney) observed, in reply to the toast of "The Visitors," that the electrical industry had suffered less than many trades during the period of depression. It was busily engaged in re-organising itself in view of the operations of the new Electricity Board. That re-organisation should result in rapid progress, and the electrical industry was hoping to carry the other industries of the country along with it.

Lady Brooks, President of the Midlands Branch of the Electrical Association for Women, said it was the hope of women that they could indirectly help the electrical industry enormously.

The toast "The Electrical Industry," was proposed by Ald. W. Walker, of Manchester (a member of the new Central Electricity Board), who said he only hoped that the forecast of politicians, that within a short period everybody in the country, in towns, or remote villages, would have at his disposal electricity without any trouble, would be realised.

Mr. R. A. Chattock, city electrical engineer, Birmingham, replying, suggested that the various associations in the electrical industry should get together and see to it that at next year's Fair, all electrical wares and developments were shown in one building. The effect of that would be to stimulate buying for the home and the export markets. The electrical industry had been marking time, but was now desirous of going ahead.

Mr. J. W. Beauchamp, director of the British Electrical Development Association, pointed out that whether we got electricity at a very cheap rate or not, would depend more than anything else on the amount the public consumed.

W. McGeoch & Co., Ltd.

Upon this stand there appeared a very varied selection of lighting fittings and switchgear. Among the former were ships' fittings of all kinds, including navigation lamps and indicators; there were also standards, pendants, &c., for the home. Self-aligning porcelain-handled fuses were shown as well as battery-charging boards, distribution boards, knife switches, lampholders, plugs and sockets, and ironclad switchgear, including colliery types.

R. A. Lister & Co., Ltd.

Two small lighting sets were shown by this company rated at 1 kW and 1½ kW respectively. In both cases the prime movers were the company's standard petrol engines, and the switchboards formed an integral part of the set. The engine is of the 4-stroke pattern equipped with automatic lubrication, and is claimed to have a very low fuel consumption—2.25 pints of petrol per b.h.p.-hour on full load. The dynamo is a 4-pole protected-type machine. It is shunt wound for battery charging and is also provided with powerful series starting windings to enable the plant to be started by means of the battery. The rating is a conservative one.

Thos. J. Digby Illuminating Engineering Co., Ltd.

The principal exhibit of this company was the artificial daylight apparatus. The "Trulyte" system is made up into special units for colour matching, photography or ordinary lighting purposes. Another device shown was a combination spot light employing a 400-W tubular projector lamp. The device is fitted with a set of lenses for giving spots of varying size and intensity.

Cambridge Instrument Co., Ltd.

In addition to the large and representative selection which was shown on its own stand, various "Cambridge" temperature-measuring and engineering instruments were in operation on other stands in various parts of the exhibition. For example, in connection with the John Thompson water-tube boiler, there was a panel of "Cambridge" instruments, comprising an index thermometer for measuring the temperature of the exit gases, a draught gauge and an illuminated CO_2 indicator, all with 13-in. dials. The last instrument was exhibited publicly in actual operation for the first time. It was connected up to a working Cochran boiler mounted on the stand of Messrs. Cochran & Co. (Annan), Ltd. The indicator possesses many novel features which greatly facilitate the work of the stoker. The actual figure representing the CO_2 percentage is illuminated by a white light, while the pointer, in line with it, is illuminated by a green light if the percentage is increasing, and by a red light if it is decreasing. A "Cambridge" thread recorder, working in conjunction with the above CO_2 apparatus, was shown on the company's own stand. This stand bore a large and varied selection of instruments. The dissolved oxygen recorder shown recorded the percentage of oxygen on a chart calibrated in cu. cm. per litre of water. The full scale deflection on the chart corresponds to one cubic centimetre of oxygen per litre. The apparatus may be arranged to operate an alarm. The CO_2 and CO indicator which was shown is electrical in principle, and contains no chemical absorbents or fragile glass work. The apparatus is robust and needs little attention. It comprises a CO meter panel connected to an indicator, together with a CO_2 meter, soot filter, and bubbler-aspirator. The Cambridge" dial gauges, also exhibited, are convenient, robust, and moderately-priced indicators for the measurement of draught or pressure up to 60 in. of water. They can be arranged to indicate directly the difference in pressure between two points. The exhibit also included draught and pressure recorders (for ranges up to 60 in. of water) and pressure and vacuum recorders with circular charts 9½ in. in diameter (for ranges up to 1,000 lb. per sq. in.). One of the pressure recorders was in operation, showing the pressure of the steam in the exhibition power plant. The temperature-measuring instruments included various patterns of the firm's "Easy-to-Read" dial thermometers, which are suitable for steam plant, refrigerating plant, &c., in marine and land installations. These thermometers are of the vapour-pressure type, and an important feature of the design is that changes in the temperature of the indicator or of the flexible tubing do not affect the accuracy of the readings. This enables the instrument to be installed at some distance from the place where the temperature is being measured. Electrical distance thermometers formed an important part of the exhibit. Indicating, recording, and combined indicating and recording outfits are made. A portable resistance pyrometer outfit; thermo-electric pyrometers; stator and rotor temperature measuring outfits; radiation and optical pyrometers; a disappearing filament pyrometer; and many other instruments were displayed.

H. H. Vivian & Co., Ltd.

This company exhibited bus-bars, condenser tubes, and high-conductivity copper strip, tape, and sections for electrical purposes.

E. Brook, Ltd.

Chief among the exhibits of this firm was a 30-h.p. motor in half section, showing all internal parts, including slip-rings, and a 5-h.p. motor on a revolving base. The latter machine had both end plates removed in order to expose the internal parts, especially the windings. Other exhibits included the rotor of a 75-h.p. motor on ball-bearings, a showroom motor, a loom motor, a buffing motor on stand, squirrel cage motors, slip ring motors, three starters with automatic features, parts of slip rings, brush gear, rotor bars, ball and roller bearings, slide rails, pulleys, &c.

C. H. Parsons, Ltd.

Once again this company presented a very comprehensive display of its switches, electric lamp holders and accessories, in addition to one or two new lines. These included a 2-pin, 10-A switch plug, a 3-pin, 10-A switch plug with earthing device, a shock-proof switch plug, and a range of flush-type switches in iron boxes. All of these were of excellent construction and finish.

Allen-Liversidge, Ltd.

In addition to a great deal of oxy-acetylene equipment, this company showed examples of "Pontelec" welding apparatus (made by Messrs. Buckley, Saunders & Co., Ltd.). These included spot, seam, and butt types of various sizes. One machine was a 3-kW butt welder, designed for the cable industry, and it is capable of dealing with wires up to large gauges in copper, brass, or steel. Samples were shown of work carried out by a spot welder for the treatment of aeroplane wings, and other samples displayed the results of the use of a flash welder which can deal with angles and sections of steel, such as casements. The spot welders have water-cooled electrodes and an automatic trip control switch by which the current is only allowed to remain on during the short period required for the weld. Numerous photographs of welders and welded products appeared on the stand.

Heenan & Froude, Ltd.

Various types of apparatus for power station work were exhibited by this firm, noticeable amongst which was the "Heenan" patent stationary cooler, which can be put to numerous uses, such as an air purifier or cooler, water or oil cooler, humidifier, or dehumidifier. Other exhibits included a stationary air filter, enclosed-circuit air coolers, and the Heenan "K" type water cooler.

J. A. H. Hunt.

On this stand was exhibited a complete range of new models of decorative house lighting fixtures. These have been designed and manufactured especially for the present demand for better-class materials at reasonable prices. There were also shown some examples of wrought iron units for the exterior lighting of public buildings, &c., and several illuminated signs.

Pritchett & Gold & E.P.S. Co., Ltd.

This company exhibited a few of its different types of accumulators for country house and central station work, and also various types of train-lighting accumulators. These demonstrated the patent anti-splash lids, special grids, and other features. A complete stationary battery was erected on the stand for the purpose of showing the construction. Component parts and a number of small accumulators for special purposes, such as wireless, were also exhibited.

Carron Company.

A large selection of its electric fires and irons was displayed by this company, but the principal electrical appliance shown was a baking oven. This is a two-compartment oven, each compartment having a 6-kW loading, and a baking space measuring 3 ft. 2 in. by 2 ft. 10 in. by 11½ in. The appliance is constructed of cast-iron and sheet steel, double-cased and lagged. The baking sole-plate of each deck is formed of cast-iron frames with firebrick tiles bedded down with fireclay. The bottom elements are fixed under the soles but not in contact with them. The top and bottom elements are controlled by three-heat "Diamond H" snap switches. Provision is made for a steam jet. Two domestic cookers were also on view. The smaller has a total loading of 6,750 W, which includes a 1,600-W and a 1,750-W boiling plates, and a 1,600-W grill. The boiling plates can be of the open-coil or the solid types. The oven space measures 14 in. by 13½ in. by 12½ in. The construction is of cast-iron and mild steel, double-cased and lagged. The other cooker was similar in construction but larger, having a total loading of 8,200 W and three boiling rings. In this case the oven space is 16 in. in each direction. All the elements of both cookers are fitted with three-heat controls.

J. H. Tucker & Co., Ltd.

This company again showed a most comprehensive range of its varied manufactures. Among these was a new double-pole ironclad switch incorporating a quick-make, quick-break positive action. It is designed on sound mechanical lines, and the switch is rated at 15 A, 250 V, or 10 A, 500 V, and independent tests have demonstrated that it is capable of breaking 50 per cent. overload at 50 per cent. excess pressure. A combined switch and fuse is also available with similar switch action (fig. 14). An interesting feature is the provision for adaptors, which provide facilities for the use of screwed con-

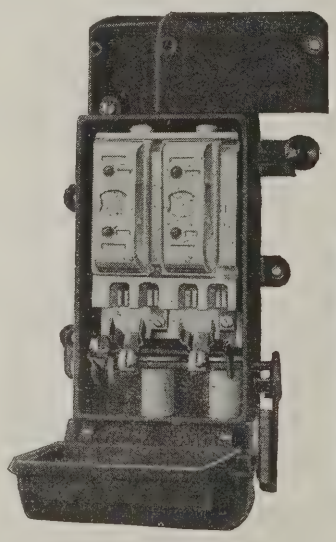

Fig. 14.—A New Tucker Switch-Fuse.

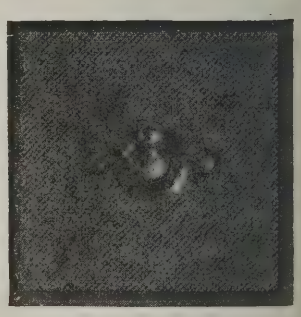

Fig. 15.—A "Telacite" Switch Plate.

duit. There was a new ironclad cut-out which is rated at 15 A, 250 V, or 10 A, 500 V, the efficiency of which is claimed to be of very high order, adequately complying with the short-circuit tests laid down by the I.E.E. The fuse handles are of the non-reversible, self-aligning type, fitted with a permanently fixed asbestos tube. The contacts are substantially made in phosphor bronze. A novelty in switchplates was shown. These were of moulded "Telacite," a material which is especially

suitable for the purpose. A novel method of fixing the plate to the switch dispenses with the need for switch rings. The surface of the plates is finely cross-cut, giving an attractive matt finish (fig. 15). As an "all insulated" plate, it has distinct advantages over glass, or other fragile material. The finish of the plate is dark brown. Adjustable grid boxes were shown in a variety of ways, and fitted with various accessories. Steel corner adjustment pins are now provided instead of brass, and the plates are secured by rings or corner fixing screws. Large quantities of these boxes have been recently used on important wiring contracts. Another new line was a quick-make, quick-break pear switch, the action of which is similar to the well-known "Tucker" push-bar lampholder. Since the last Fair was held, Messrs. J. H. Tucker & Co. have largely developed the heavy duty quick-make, quick-break switch, which was an outstanding feature of their exhibits a year ago. It is now available not only in 5-A and 15-A ordinary flat types, but also in semi-recessed, earthing types, locked covers, switch sockets, flush switches and practically in all types and patterns. A 5-A switch of this new type has successfully broken a load of 33 A at 250 V. Fuseboards and distribution boards in iron and teak cases in a wide variety of types, Home Office, channel, solid block, &c., and knife switches, power fuses, and gear for switchboard mounting up to 1,000 A formed an interesting display of the heavier products. Ironclad switches and combined switch-fuses, double- and triple-pole, up to 100 A were shown in several types, and there were also on view house service fuse boxes, ceiling roses, plugs and sockets, lampholders, switchplates, &c.

Rainsford & Lynes, Ltd.

The principal exhibits on this stand were Phillips's patent "Supersize" fittings for electric lighting, which are this company's latest product. These are constructed along rather original lines. A simple and ingenious arrangement of the stem of both the pendant and the wall brackets allows them

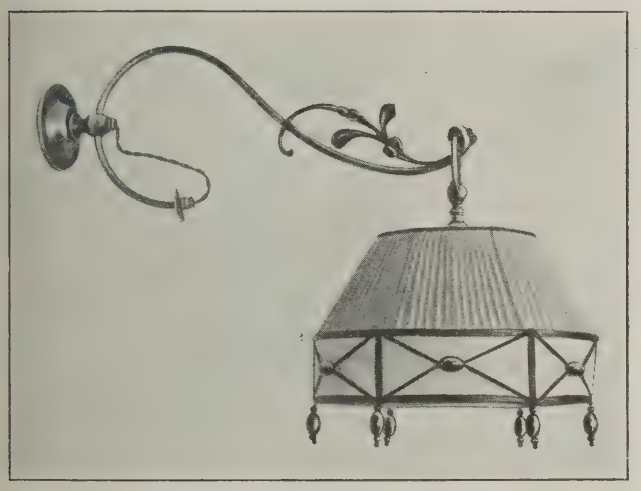

Fig. 16.—A "Supersize" Lighting Bracket.

a rise and fall movement, and also gives the wall brackets a lateral movement of 180 deg. This arrangement can be seen in fig. 16. The rise and fall movement puts no strain on the flex and requires no balance weight, so that shades of any weight or design can be used. The design of both the pendant and the wall bracket are very good.

Hart Accumulator Co., Ltd.

On the stand of this company was displayed a representative collection of products of interest to all classes of users of electrical storage batteries. For low-tension wireless circuits there were the types known as "Magno," "Enduro," and "RME." These cells are assembled in specially moulded pressed glass boxes, upon the insides of which are moulded ribs or grooves which extend almost to the bottom of the box, between which the plates themselves rest. This design obviates the need for bottom blocks, and the absence of these provides a larger space for the collection of deposit from the plates, as also for a greater volume of electrolyte. As an additional safeguard, these particular cells are equipped with corrugated sheet ebonite separators. The "RME" type is intended primarily for use with valves requiring considerable current. The general finish resembles that of the "Magno" and "Enduro" types, whilst the accumulator is also provided with connectors, manufactured from an alloy of non-corrodible metal, suitable for connecting several cells together when a battery is required consisting of a number of these cells. The "MEZ" type of ebonite accumulator is specially suitable for tropical climates in which the atmospheric conditions may make the use of celluloid batteries inadvisable. "Hart" high-tension accumulators were also exhibited. The container consists of a moulded glass box which is provided with grooved bottom rests into which the plates fit. The lid is of ebonite, sealed to the cell with a special compound, and when assembled into batteries the cells are connected to each other by connectors made from a non-corrodible alloy, which also serve as points of contact with a wander lead fitted with clip terminals. Both the positive and negative plates are covered with sheets of perforated ebonite, which completely envelop the plates, thus preventing any dislodging of the active material from the grid structures. Other exhibits included batteries for private house lighting, central station work, yacht lighting, &c.

Hewittic Electric Co., Ltd.

The d.c. supply for the Fair was converted from the Birmingham 5,000-V, 25-cycle supply by a mercury-arc rectifier equipment made by this company, upon the Corporation's stand. This had a capacity of 460 kW, and comprised a 280-kW equipment feeding into the outers, and a 180-kW equipment feeding into the inners of the three-wire d.c. system. This arrangement illustrated two types of equipment, as supplied for boosting (feeding across the outers) or for feeding into a three-wire system, and dealing with the out-of-balance load (inners). One of the developments which have taken place in connection with rectifiers has been in the means of voltage regulation. This used to be obtained by means of tapped auto-transformers controlled by tapping switches, the latter being operated either by a handwheel from the front of the cubicle, or by a motor, controlled by a pressure relay. This means is still employed, and gives every satisfaction, but on the larger units the company has adopted the use of an induction regulator controlling the primary supply into the step-down transformer which feeds the rectifier sets, as this method becomes then more

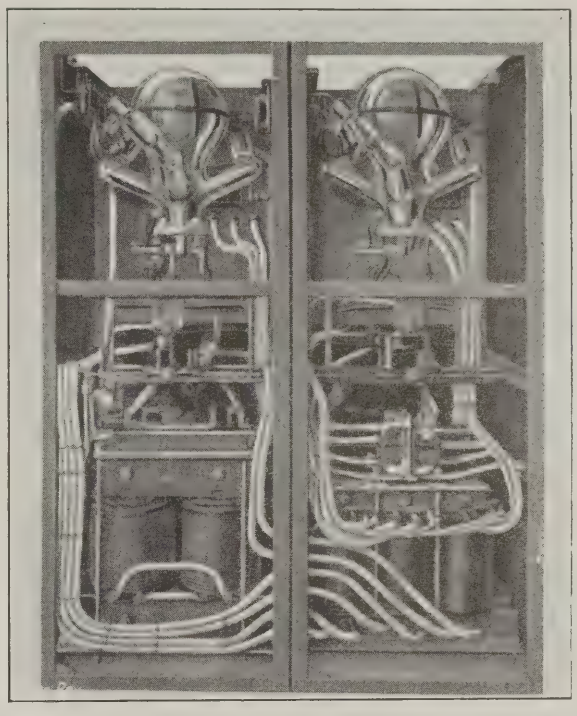

Fig. 17.—Hewittic Mercury-vapour Rectifier Cubicles.

economical, besides offering a finer means of regulation. While the rectifier first entered the field in connection with small sub-stations, it is now being used extensively for capacities up to 1,500 kW, and the company has a 2,000-kW sub-station which has been running for more than 12 months. The chief characteristic of the rectifier as a convertor lies in the fact that the plant is static, and it is simple and almost inherently automatic. It requires a minimum of attendance, and if it is desired to make it absolutely automatic either by means of pressure and current control, time switch, or remote control, the gear necessary entails a very small number of relays. Fig. 17 is a rear view of two typical light and power cubicles. On the company's stand various other products were exhibited. Among these were "Service Light" lamps for industrial lighting. These are divided into two kinds. Lamps with long tubes are used for normal workshop lighting, while silica lamps are employed for yard lighting and lofty buildings. "Service Light" is quite characteristic, giving a thoroughly diffused glareless light which, it is claimed, offers the nearest approach to daylight obtainable from a commercial illuminant. This results from the fact that the light is emitted not from a point source, but from a surface of considerable area. The lamps are also very efficient from the current consumption point of view; for long-tube lamps it is $\frac{1}{3}$ W per c.p., and for silica lamps it is $\frac{1}{4}$ W per c.p. All the lamps start automatically on the closing of the switch controlling their circuit. Owing to the high actinic value of mercury-vapour light, it is used by all the leading photographers for studio work, printing, enlarging, &c. Typical photographic outfits were displayed. The mercury-vapour light is also very rich in ultra-violet rays. The company exhibited the Hewitt-Levick "Ulviarc" lamp for radio-therapeutics, water sterilisation, testing of dyes,

treating of leather, and other purposes, as well as other medical lamps for similar purposes. Other exhibits were cabinets for testing purposes, a small water steriliser, and small rectifiers for battery-charging purposes.

John Harper & Co., Ltd.

Castings for electrical machinery were shown on this stand, a special display being made of castings for switchgear and instruments.

Imperial Engineering Co., Ltd.

This company had a comprehensive exhibit of its electrical appliances for domestic use. Noticeable amongst them was the "Imperial Senior" electric iron, which embodies a number of improvements. It is heavily nickel-plated, and the element is of high quality hard mica, wound with nichrome ribbon. The thumb rest is of green erinoid. Another appliance shown was the "Carlton" electric heater. This is an artistically-designed heater of the portable type, there being three elements with a four-sided sloping reflector. It is made of solid copper, highly polished, and mounted on a cast-iron pedestal. Four types of electric fire were also shown. Conspicuous amongst these was the "Midland" design, which is a handsome cast-iron front fire with a polished nickel-plated bowl, 12 in. in diameter, the element being of the spiral type. It is made in three loadings, and can be supplied with either oxydised copper or oxydised silver finish. Other exhibits on this stand included "Imperial" immersion heaters, and the "Imperial" toaster, which is made for all voltages.

Runbaken Magneto Co.

On this stand was exhibited, amongst other things, apparatus specially designed for automobile electrical repairs. One exhibit was a starter battery test meter. This is constructed on the principle that to form an opinion as to the state of a cell without first dismantling it, it is necessary to subject it to a heavy rate of discharge and a simultaneous voltage test, the voltage under these conditions varying in relation to the current discharging; an undue voltage drop during discharge can be taken as a positive indication of serious trouble. Thus it is possible to isolate a particular cell as defective. With this instrument a load up to 250 A can be applied at the time of testing, and a small inspection lamp is provided which, in addition to lighting up the face of the meter, gives an indication of the state of the cell. The meter, which indicates both volts and amperes, is of the moving coil type, and robust in construction. The prongs are of hardened nickel steel and are readily renewable. Another interesting exhibit was the "Runbaken" spotlight and portable lamp, which was recently described in this journal.

Rawlplug Co., Ltd.

The principal exhibit of this company was a comprehensive range of "Rawlplugs," which are too well known to require describing here. Every size, ranging from ½ in. to 4 in., was shown, together with the accompanying "Rawldrill." A more recent line exhibited was the "Rawlplug" bolt anchor, an invention which enables exceedingly strong fixings to be obtained for bolts in practically any kind of hard material. It is constructed from specially chilled iron in combination with lead, and is so formed that when fixed in position upon the head of a bolt, the chilled iron section forms a series of struts between the bolt-head and the walls of the hole, the result being that it is impossible to withdraw the bolt until the walls of the hole itself actually break away or the bolt fractures. In actual tests a ½-in. diameter bolt used in conjunction with a bolt anchor sunk in concrete has withstood a pull of about 3½ tons. It is unaffected by atmospheric conditions, and can be safely fixed under water when necessary. Another new line shown was "Durofix." This is a new kind of adhesive possessing the property of resistance to both heat and water; it is ready for instant use without first warming. It is strongly adhesive, and, since it is colourless, invisible joins can be made with it.

Jackson Electric Stove Co., Ltd.

This company had a display of eight electric cookers, ranging from the "No. 18" model with a maximum loading of 2.8 kW, to the "No. 24" model with a maximum loading of 8 kW, and capable of catering for 10 to 14 persons. All these models are designed on the same principles, the only difference being in the size, and the addition of certain accessories. The chief point of interest is the boiling plate, to which the makers attach considerable importance. This is of the "fully-protected" type, for which a patent has just been granted. A channel-shaped reflector of aluminium alloy carries the fireclay supporting pieces, and these, together with specially shaped fireclay end blocks, are held together by removable rods, which serve also to support the element in position under the cooker hob plate. The heating spirals are laid in slots in the fireclay blocks, and, to prevent sagging between these supports, fireclay rods are threaded through the spirals. Over the top of the element is fitted an inverted shallow metal tray, which provides full protection against spilt liquids and foodstuffs coming into contact with the spirals. These protecting covers are attached to the cooker hob, and access to the element can only be obtained from the underside by raising the hinged hob plate. All the metal parts of the element, with the exception of the terminal nuts and bolts, are of rust-proof, non-corroding alloys. Other interesting exhibits on this stand included electric wash boilers (which are supplied with the "Perco-Wash" spraying device), bath water heaters, hot water tanks arranged with a continuous low loading and with or without boost or thermostatic control, breakfast cookers, fires, kettles, &c.

Berry's Electric, Ltd.

This year the company had two separate stands. One of these was covered in to provide semi-darkness, in which a number of "Magicoal" fires could be seen to the best advantage. The other stand was mainly devoted to switchgear. A prominent feature was a "Viking" ironclad switchboard; this type of board has open access to the bus-bars and can easily be extended. There were also examples of interlocked foolproof circuit breakers and fuses, including a 3-pole, 200-A pattern. Switches of the "Firimine" and "Firadanac" type were shown; as their names imply, these are designed for colliery use. A section of the stand was given up to "McLary" cookers," the manufacture of which the company is undertaking. In this type of cooker the oven elements are plugged in, while the hot plates are removable bodily, being also of plug-in design. Other points are a separate socket for an iron, a door thermometer and three-heat snap switches for all the elements. The exhibit also included instruments by Messrs. Nalder Bros. & Thompson, Ltd.

Hendon Electric Lamp Co., Ltd.

Examples of "Hendon" lamps, lampholders, and switches were shown, among the apparatus being the "Unique" shade carrier. This is designed to replace the ordinary shade ring which with many types of fittings is very difficult to manipulate. The carrier consists of two rings, between which is a strong helical spring. The upper ring actually retains

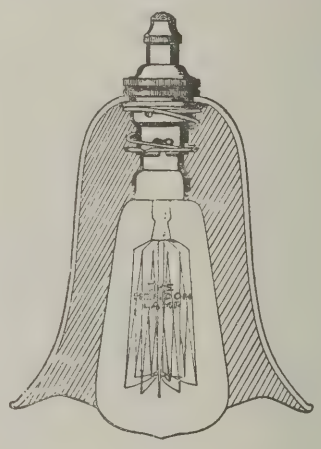

Fig. 18.—The "Unique" Shade Carrier.

the shade in position; a lug on the lower one engages in the lamp slot. For this purpose the slot has to be cut extended the opposite direction. This, of course, necessitates a special form of lampholder which the company provides. It also supplies a special tool by means of which the ordinary pattern of lampholder can be cut in the necessary manner. The carrier is slipped over the lower part of the lampholder, and when the lug on the bottom ring engages in the slot the top ring presses against the shade and is kept in position by the spring. The device is illustrated in fig. 18.

Holden & Hunt.

One of the principal attractions at this stand was the automatic wire-bending machine, which, with the chain welder, was seen making chain direct from wire. This was the No. 2 size, which is capable of forming ordinary and block chain from wire up to 5/16 in. diameter at the rate of 50 links a minute. The bender, which is of massive construction and well proportioned, was driven by a 2-h.p. motor. Another exhibit was the double-headed rivet heater, which has several unique features. The machine is rated at 25 kW and is capable of heating 200 ¾-in. diameter rivets per hour, the time for other sizes being in proportion. In addition to the No. 3 size universal spot welder, there was shown a larger size of spot welder. This was the No. 4 size, which has a rating of 25 kW, and is capable of welding iron and mild steel up to ⅜ in. added thickness on repetition work, or ½ in. added thickness occasionally. The No. 3 size is a 12-kW machine and will weld up to ¼ in. added thickness on repetition welding, or 5/16 in. occasionally in iron and steel. These spot welders are free from any risk of electric shock, and even during the progress of welding all exposed parts can be handled freely. An automatic trip switch of simple design and having a wide range of adjustment is fitted, the renewable contacts being made from non-arcing metal. The heating speed is controlled by means of a four-way regulator, whilst the water-cooled electrodes can be fitted quickly and easily with renewable tips of varying

shapes to meet different requirements. A well-designed example of hand-operated butt welding machine was also displayed. This is intended primarily for heavy jobbing work and is capable of welding up to 1 square inch section. It is rated at 30 kW, and is designed on principles of strength, easy adaptability for undertaking a wide variety of work, and extreme accuracy of alignment under the heavy "upsetting" pressure required. The machine is water-cooled throughout, and the "upsetting" pressure is applied by means of a powerful eccentric cam designed to give the pressure in a direct line with the required "upset" and to prevent any twisting or unbalancing force from acting on the slide. The switch is foot operated, and the heating speed is controlled by means of a three-way regulator. The application of butt welding to light engineering work such as joining lengths of wire together, welding nickel pins to steel shanks for sparking plugs, &c., was illustrated by the No. 2 size wire welder. This machine, which is rated at 4 kW, is very sensitive and efficient, being capable of welding iron and steel (mild or high carbon) up to 5/16 in. diameter, brass and similar alloys up to 3/16 in. diameter, and copper up to ⅛ in. diameter. A heavy cast-iron body completely enclosing the high-pressure parts is carried on a rigid cast-iron stand, the whole being mounted on wheels. A ½-kW bench wire welder was also shown.

Dundee Electrical Repairs Co., Ltd.

This company exhibited a control pillar for d.c. motors, comprising a d.p. isolating switch, two s.p. overload trips, with time-lag device, two s.p. contactors, starting switch and shunt field regulating switch, all mounted on an enamelled slate panel enclosed in a sheet-iron case. The starting switch eliminates pitting and burning of the short circuiting brushes and resistance contacts. This is accomplished by the introduction of a second moving brush capable of carrying the main current. By a simple method, this second moving brush is prevented from carrying any current at those periods when it bridges any two resistance contacts; hence there is no overloading of the brushes and contacts. The starting switch and shunt regulating switch are moved horizontally through a screw and nut, the handles projecting through the right-hand side of case and also that of the isolating switch. Two push buttons are provided on the front of the panel, one for "inching" and the other for stopping. The shunt regulating switch is electrically interlocked, so that the motor will not start up on a weak field.

International Combustion, Ltd., and the Underfeed Stoker Co., Ltd.

Upon this joint stand were several examples of pulverised fuel and other boiling firing equipment. Among these were a model "Raymond mill," complete with cyclone separator, for use in power plants for pulverising coal and for the grinding of many other materials; a "Lopulco" feeder of new design and a section of a "Lopulco" combustion chamber, showing arrangement of the Murray walls; Murray fin-tubes, the fin of one tube being staggered in relation to that of the next tube, and taken up to (wooden) headers; an "Usco" unit pulveriser, in which the fuel is treated by causing the particles of coal to come into contact with each other at a fairly high speed; an "Usco" air heater, consisting of a series of hollow elements inside of which flows the air to be heated, whilst around them flow the flue gases, in a contrary direction; impelled draught furnace fronts, a sort of "half-way house" between hand firing and mechanical stokers; and a "H" stoker with several new features.

Callender's Cable & Construction Co., Ltd.

This stand was arranged to show the company's capabilities in the way of providing apparatus for dealing with power in large quantities as well as in smaller (domestic) quantities. A special feature was made of the "Kaleeco" wiring system, and samples were shown of the special fittings and wire used. Among the principal points of the latter are a special earthing wire laid beneath the metal sheathing, and the entire absence of hygroscopic tapes. Many samples of cable were shown, and a large part of the stand was occupied by typical transformer kiosks, which are made for pressures of from 3 to 11 kV. The l.p. panels were fitted with enclosed fusegear. The bodies are either of cast iron or all steel. Other exhibits were telephone cable, a 33,000-V trifurcating box, house-service boxes, "Fors" accumulators, and "Kalanite" insulating material.

Electric Heating and Hardware, Ltd.

This company exhibited an electric cooker designed along new and improved lines. In this the general wiring system is extremely simple, there being three solid terminals only passing through the lagging. These are protected by distance tubes and insulated from any moisture that may accumulate. The fuse-box is roomy and easily accessible, and all fuses and connections may be examined by sliding down the outside panel, which is secured by a wing nut. The insulation consists of steatite bushes throughout, no mica being used. The heating elements are of special design, being made up of small steatite formers built on racks, or grids. Each element is easily detached and is interchangeable, contact being made direct with bus-bars. Four elements are fitted on either side of the oven, and also two for bottom heat when required. Consequently, the elements cover practically the whole superficial area of the inner body, giving good distribution of heat at any loading.

Hackbridge Electric Construction Co., Ltd.

The principal exhibits on this stand were two large transformers, the first being a 2,000-kVA, three-phase, 50-cycle, 11,000-V oil-immersed self-cooled transformer, and the other a 250-kVA, three-phase, 50-cycle, 6,600-V, oil-immersed, self-contained pattern. Both transformers were of modern design and construction, and embodied many of the latest improvements. Another exhibit was a complete automatic voltage-regulating equipment, comprising switchgear and transformers connected up and operating, the switches being of the contactor type. There was also a display of transformer construction and assembly details, and a noticeable exhibit was the "Hackbridge" tapping switch, which represents a great advance in transformer tapping-switch design. Other plant displayed consisted of a standard tubular tank with rounded ends, and a standard type of mining tank.

Excelsior Shade Manufacturing Co.

This company, which reported good sales during the Fair, had a very comprehensive display of its latest designs in lamp shades. These vary in size from the small shade for a bracket to large and expensive shades for pendants. The fittings are of silk flounce over wire, constructed in the usual manner, while some of the heavier types are made with rings of oak or mahogany to match furniture. Beads and other types of decoration also play a prominent part in the designs.

I. Calvete, Ltd.

This company exhibited at both sections of the Fair. Its Birmingham display comprised ultra-violet apparatus, vibrators, and other electromedical apparatus. Radiant therapy lamps of various types were shown, and there was also an "Icall" blower incorporating a heating element. One novel feature was a combined massage and hair-clipping apparatus, in which the change of function was arranged for by changeable heads upon a flexible shaft.

Camille Espir.

This stand, although small, bore a beautiful display of decorative electrical fittings. These were of several kinds of material, such as "Erinoid," synthetic resin, "Celastoid," and wood, and included standards, pear switches, switch plates, ceiling roses, &c. Emphasis was laid upon the fact that all the electrical fittings for a room, from the switches to the lighting fittings, could be produced in the same design, a very unusual thing.

Thermo Path Co., Ltd.

Examples of the "Merocol" screen fire, described a short time ago in the Electrical Review, were exhibited by this company. These, it will be remembered, are fire screens with a boss-type electric fire which, when not in use, can be covered in with an ornamental plate. Other types of electric fire were also shown, in addition to artistic floor and table standards for electric lighting, the "Windsor" electric oven, &c.

New Conveyor Co., Ltd.

One of this company's exhibits was a foundry sand-recovery plant, shown working. Driven by a 4-h.p. electric motor, this equipment comprises a band passing over two drums, one of which is of the electro-magnetic type made by the Rapid Magnetting Machine Co. This separates out the metallic particles from the sand, which passes to a jigging screen, from beneath which the sand is recovered.

Electrical Power Engineers' Association.

This exhibit drew attention to the beneficent work of the National Joint Board, to which the Association is a party, emphasising the important work of the board, particularly in respect of the training of electrical power engineers. In addition, the educational work of the Association through technical lectures and by articles in its *Journal* was stressed.

Electrical Power Engineering Co. (Birmingham), Ltd.

Motors, lighting plant, and pumps were shown by this company. The lighting set was of the "Warwick" type suitable for small country houses. A battery-charging set was shown, as well as an electric motor provided with "Fabroil" reduction gear.

Tubes, Ltd.

On this stand were exhibited various type of weldless steel tubes, boiler tubes, and steam pipes for high-pressure work, both for marine and power-house use. The boiler tubes are manufactured to meet various naval and marine specifications and requirements.

Young, Osmond & Young, Ltd.

This company again displayed short sections of its "Lightfoot" and "Unity" heating apparatus. This is of the tubular type with low, distributed loadings, the wires being enclosed in metal tubes for mounting along skirting boards, &c.

The "Ideal Home" Exhibition.

A review of the electrical features of this year's show at Olympia, London.

VISITORS to the Ideal Home Exhibition at Olympia, London, this year are finding that it has again surpassed the shows of the previous years in the collection of new methods and ideas for the housewife. Olympia itself is transformed with fresh decorative schemes, and a new mezzanine terrace is found at the end of the main hall. An attractive feature is a scene of rural charm in the new hall where a flower-fringed village stream borders a picturesque group of full-size furnished houses, one of which, a Tudor mansion, is the largest house ever built inside Olympia.

In the main hall a fountain court forms the centrepiece of a display of electrically lit furnished rooms, and the art of landscape gardening again transforms the annexe into a fascinating spectacle of spring. Another feature of interest may be seen in the Hall of British Handicrafts in the gallery, where the operation of a variety of old crafts is shown.

Our Dominions are represented by a great display staged by the Empire Marketing Board in the new hall gallery, where there is also a vast array of exhibits of other British commodities for replenishing the larder.

In connection with the lighting of Olympia this year for the Exhibition, some shades are in use which are believed to be unique in some respects. Fig. 1 is a general view of these.

Fig. 1.—Large Electric Light Shades at Olympia.

There are 20 all told, and they are each 14 ft. in diameter and 16 ft. 6 in. high. Each is constructed on an iron framework, weighing about 3 cwt., which is covered with ordinary good-quality bed sheeting, hand sewn on to the frame work with special twine and copper wire. The outside and inside are dyed and painted respectively, orange and blue, the whole being efficiently fire proofed. The framework was made in sections at the workshops of the makers, Messrs. Walford Art Co., London, and assembled on the site. The shades are each equipped with two or three outside-type 1,000-W fittings, those already installed in the building, so that the illumination from each shade is four or six thousand c.p.

The shades are placed 55 ft. above the floor, measuring from the bottom of the shade. Each is carried by an 8-in. ring, by means of chains, and is suspended by two ¼-in. steel wires from the roof girders. Twenty fittings fixed above the shades illuminate their exterior, and result in a pleasing effect. The contractors for the work were Messrs. William McGeoch and Co., Ltd.

It is encouraging to note that the electrical industry is fairly well represented this year, although it is a pity that the Electrical Development Association has not found it possible to take part in the show as in previous years; on the whole credit is due to the electrical firms for their displays. It is also interesting to note that there is a general spirit of co-operation among the electrical firms in order to more effectively compete with the gas industry, which, by the way, is obviously making very great efforts. A new introduction is that of ultra-violet apparatus, which is not only shown by electrical firms, but is included in some of the general exhibits, of the more luxurious nature, as modern bathroom equipment. There is also the exhibit by the Zoological Society, London, of a working-model section of the new monkey house which is being constructed at the "Zoo." A portion of the cage is roofed with "Vitaglass" to admit the ultra-violet from high-c.p. incandescent "Lamplough"-glass lamps. An electrically heated floor serves to keep the animals warm.

The following is a brief summary of the electrical exhibits:—

Reliance Telephone Co., Ltd.

The wide scope of the telephone and the degree to which it can be used to save labour is clearly demonstrated at this stand, where an all-British display shows that internal telephone communication is no longer the prerogative of offices and large hotels, and that it can be conveniently installed in clubs, flats, nursing homes, and private houses. On the Reliance service telephone system shown, calls can either be made from any floor or room to one central point, or, alternatively, the installation can be arranged so that every instrument can call directly every other instrument without the assistance of a switchboard operator. The Reliance auto-intercommunication system is somewhat similar, but is designed particularly for use in smaller offices, works, banks, hospitals, and so on. The Peel-Conner private automatic exchange telephone systems are represented by a 25-line and a 50-line Peel-Conner P.A.X. exchanges. The design of these allows for the incorporation of such special facilities as executive control, secretary's service, firm-alarm service, conference lines, and general code calls.

Belling & Co.

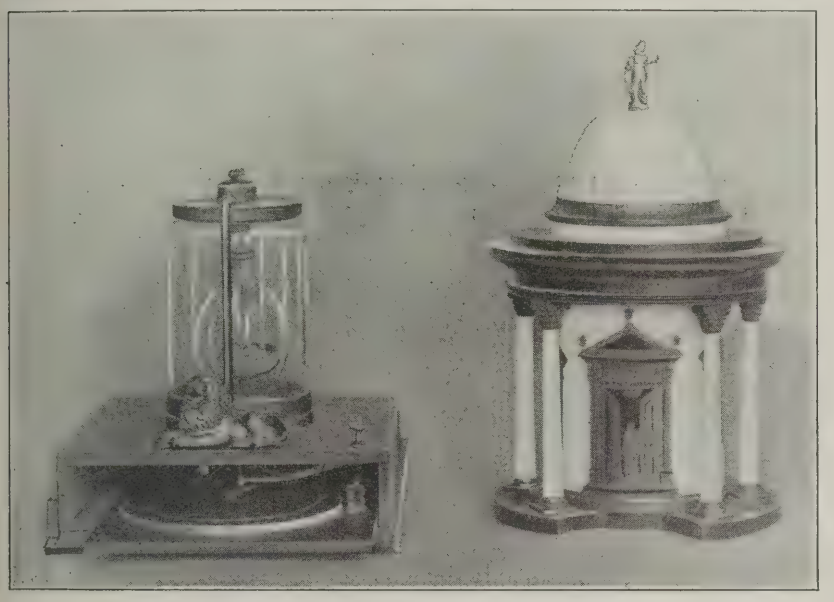
As might be expected, the outstanding feature of the exhibit by this firm is a comprehensive range of "Belling" electric fires. Included in these is a series of four imitation coal fires which have not yet been marketed. The multi-parabola fire-bar feature, common to the electric fires made by this firm, is being utilised in these new models, but to meet the different design requirements it is being made up in another form. The latest type of boiling plate adopted in the electric cookers by the company may be seen. It is a modification of the makers' "Honeycomb" plate (Electrical Review, November 27th, 1925, p. 846). The fireclay through which the element spirals are threaded is now solid in one piece, and the bottom side of it is drilled so that small portions of the elements are exposed on this side. A feature of the new "Belling" cooker is its stainless-steel linings to the oven. A new model of the makers' cookerette is also exhibited. This is now made up as one unit, and a drop-down door is provided for the grilling chamber under the oven. For cooking demonstration work on this stand an ammeter graduated to show the consumption price per hour is proving attractive.

Francis Polden & Co., Ltd.

This firm is showing a complete Armstrong-Whitworth country-house lighting set of 1½ h.p. This is equipped with a "Wico" magneto, a separate model of which is shown working satisfactorily with water running over it. A recent introduction to the "Creda" cooker is also to be seen here; this is equipped with a white enamelled hob, and it is claimed that the special enamelling used stands up to the heat particularly well. Amongst all manner of lighting fittings, into which a very fine colour scheme is worked, are a number of triple-jointed bracket lamps, suitable for the local lighting of difficult spots, such as is required in dentistry.

Dowsing Radiant Heat Co., Ltd.

A variety of unusual electrical appliances may be seen on this stand. A number of bowl fires permanently and vertically set in cast frames are shown; also a combination of three bowl fires arranged triangularly on a framework, each bowl being arranged for tilting either up or down. An interesting exhibit in connection with electro-medical apparatus is the "Ultradescent." This provides both ultra-violet and heating, being equipped with tungsten filament and heating lamps. It is in the form of a polished-metal shroud for bed treatment. Various types of ultra-violet arc lamps and high-frequency apparatus are also shown.



(*To be continued.*)

Illuminating Engineering.

Conditions governing good lighting: some street-lighting problems.

(*Résumé of Proceedings before the* Institution of Electrical Engineers.)

THE ordinary meeting of the Institution of Electrical Engineers on March 3rd was preceded by a demonstration in the Common Room, by Mr. Ll. B. Atkinson, of a very old electro-pneumatic lamp. It consists of a glass vessel (fig. 1) wherein hydrogen gas is generated by the action of acid on zinc: on a lever being depressed, a jet of gas is liberated and simultaneously ignited by a spark from an electrophorus contained in the wood base of the instrument. The whole is housed within a decorated porcelain container (fig. 2) representing a "Temple of Venus," and is in an excellent state of preservation. The device was patented in 1807, and was made in Germany; it has been in the possession of Mr. Atkinson's family for over 100 years, and is an extremely rare specimen of its kind.

Figs. 1 and 2.—An Electro-pneumatic Lamp and Cover (right).

Two papers were presented (one of which is abstracted below), and a discussion followed, during which a draft B.E.S.A. specification for street lighting was outlined. Mr. H. T. Harrison's paper will be summarised in a forthcoming issue. Several different makes of photometer were exhibited.

Illuminating Engineering.—(*Abstract.*)

By John W. T. Walsh, M.A., M.Sc., A.M.I.E.E.

The wide range of subjects, physics and engineering, physiology and psychology, coming within the purview of the illuminating engineer is pointed out. A brief *résumé* of the recent rapid progress in illumination is followed by a description of fundamental principles, in particular the use of the modern conception of luminous flux in illumination calculations.

What is emitted by any source of light is radiant energy in the form of waves capable of being appreciated by our eyes as light. The eye appraises this energy variously according to the wave-length in which it is conveyed, the maximum visual effect being produced at a wave-length of 555 millimicrons. Thus by appropriately weighting each wave-length, the rate of energy emission from a source can be expressed in terms of visual effect, or luminous flux. The lumen is defined as "equal to the flux emitted in unit solid angle* by a uniform point source of one international candle." If a point source of which the luminous intensity is 1 candle in every direction be placed at the centre of a sphere from which there has been removed an area equal to the square of the radius (fig. 3), and if all reflected light be neglected, the light flux which escapes from the opening in the sphere is equal to 1 lumen. If, now, the unit source be replaced by one having a luminous intensity of I candles in every direction lying within the cone shown shaded, the flux emitted within this cone is I lumens, and equally so if the *average* luminous intensity in this cone be I candles. Since the area of the whole surface of a sphere is $4\pi r^2$, the luminous flux emitted by a source is equal to 4πI, where I is the luminous intensity if this is the same in all directions, or the average luminous intensity if the distribution be non-uniform (the practical case). This average luminous intensity in all directions in space is often termed the mean spherical candle-power, so that the luminous flux output in lumens is equal to the mean spherical candle-power multiplied by 4π.

The conception of luminous flux leads to a most convenient definition of illumination: if the luminous intensity of the source be 1 candle and the radius of the sphere 1 foot, the illumination of the interior surface of the sphere (reflected light being neglected) is everywhere equal to 1 foot-candle; but the area of the surface defined by the shaded cone is in this case 1 square foot, and the flux reaching it is 1 lumen; therefore, the illumination of a surface may be defined as the flux density, or flux per unit area, reaching that surface, the foot-candle thus being equal to 1 lumen per square foot.

Values were formerly invariably calculated by means of the inverse-square and cosine laws; now, however, the more usual procedure, at any rate in planning a general lighting system, is to multiply the area to be lighted (A square feet) by the illumination (E foot-candles); the useful flux required is thus AE lumens. A "utilisation factor" U is then applied to convert the "useful" lumens to the lumens actually emitted by the lamps. The value of the factor U ranges from about 0.2 to 0.6 according to the shape of the room to be lighted, the tone of the internal decoration, and the system of lighting employed. The luminous flux output required is thus AE/U and the number and rating of the lamps is chosen accordingly.

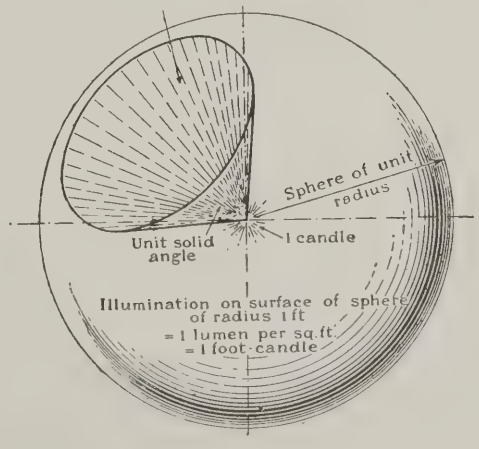


Fig. 3.—Area of Surface of Sphere of Unit Radius = 4π = Total Flux of Light from a Source of Unit m.s.c.p.

The photometric bench used for the measurement of candle-power, *i.e.*, the comparison of the luminous intensities of two sources of light in a fixed direction, is still the basic instrument in light measurement. The photometer head may take many different forms. All depend ultimately upon the capacity of the eye to judge when two contiguous surfaces presented to it are equally bright. The precision with which this judgment can be made governs absolutely the precision of all photometric measurement. The governing factor, then,

* The unit of solid angle, sometimes called the "steradian," is the angle subtended at the centre of a sphere by an area of the spherical surface equal to the square on the radius.

is psychological and not physical and is subject to the limitations of perceptual phenomena. The curve relating the lowest perceptible contrast in percentage ($100\delta B/B$) with absolute brightness for white light (actually the light of a flame lamp) is shown in fig. 4. The governing factor is not the brightness of the field looked at, but the brightness of the image formed on the retina; as the pupil of the eye enlarges at the lower values of field brightness, it would be unsatisfactory to plot values of field brightness as viewed by the eye with the natural pupil. The scale of abscissæ is therefore a scale of field brightness when the eye is covered with an artificial pupil having an area of 1 mm².† In ordinary photometric work the natural pupil is used up to a limit of about 10 mm² (the area of the artificial pupil in the usual Lummer-Brodhun head). A second scale of abscissæ has therefore been added to show the actual field brightness under normal working conditions *assuming an average value for the pupillary aperture at each brightness.* The quantitative effect of colour

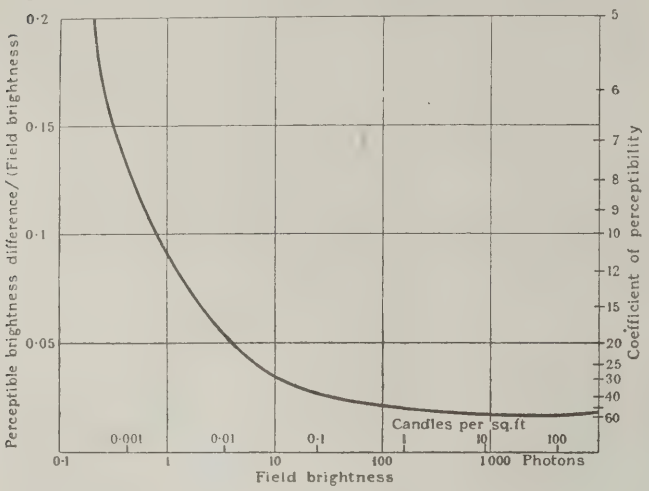

Fig. 4.—Variation of Contrast Sensitivity with Brightness.

difference has not been extensively studied, and no doubt it, like the other factors influencing an equality judgment, must depend markedly on the individual.

Essentially, there is no difference between the head used on a bench for the measurement of luminous intensity and the portable photometer used for illumination measurements. However, one class of illumination measurement demands special consideration; in streets, the light is incident at a small angle with the horizontal, especially at the point of minimum illumination. Large errors are therefore almost inevitable if any attempt be made to measure the illumination of a horizontal plane at this point in the ordinary way. The only satisfactory method of finding the horizontal illumination is to place the test surface so as to face each lamp in turn, and to measure the "normal" illumination due to that lamp in the ordinary way. The horizontal illumination can then be found by multiplying the value so measured by the sine of the angle which the light makes with the horizontal. Since this angle is usually small, the sine of the angle varies approximately as the angle itself, so that an accurate determination of the angle is essential. For street-lighting work, therefore, it is necessary to have, in addition to the photometer, a device for determining the angle which the rays from any light source make with the horizontal. Sometimes such a device is fitted to the photometer itself. In the new Holophane instrument it takes the form of a skeleton telescope and angular scale; when the instrument is levelled, the image of the source is focused on the cross-lines and the angle required is then read on the scale attached to the card-holder. The values of partial horizontal illumination thus calculated for each lamp are added to find the total horizontal illumination.

The brief description (in the paper) of some of the instruments used for the measurement of illumination, and of the errors inherent in this type of measurement, suffice to indicate the order of accuracy attainable in normal practice. With a satisfactory instrument, recently calibrated and carefully used, the precision may probably be put at about 8 to 10 per cent. for field work at normal values of illumination (1 foot-candle and upwards). As the illumination is reduced the precision falls, until for work in illumination of the order of 0.02 foot-candle (the illumination due to the full moon, a value not uncommon in street lighting) a precision better than 25 per cent. can hardly be hoped for.

Conditions Governing Good Lighting.—The factors governing design may be divided broadly into two main classes: the illumination must be *adequate* and the lighting must be *suitable*. The tendency to concentrate on adequacy without similar attention to suitability is a serious mistake: it is an easy matter to draw up a schedule of the illuminations considered necessary for different places or classes of work, and often nearly as easy to draw up a lighting scheme to give this necessary illumination, but careful consideration of the special requirements of each system as regards the placing of the light sources, the use of suitable shades or reflectors, the best scheme of interior decoration and the possible advantage of using light of some special colour, demands much more care, much experience, and constant touch with the rapid developments now taking place in the design of lighting equipment.

(*a*) *Adequacy.*—No excuse, then, is made for passing over "adequacy" in a few lines. Most books on illuminating engineering give tables of foot-candle values recommended for different purposes; in the author's personal opinion, however, the values given in such tables should be regarded as minima. Values double, or even treble, these can be employed with advantage in nearly every case, but always with the proviso that the system is planned with due regard to the principles explained in the paper. Most people will gladly work in daylight, which is often 5 or even 10 times as great as that they consider to be too high in the case of artificial light. The fact is that, generally speaking, the conditions under which daylight is received are immeasurably superior to those to which we are accustomed in the case of artificial lighting. Once again it is a matter of "suitability." The governing factor in determining visibility is not illumination, but brightness; therefore, in general, where the work is normally dark in tone, the illumination should be at least three times that allowed for in the tables of illumination values referred to above.

(*b*) *Freedom from Glare.*—Quantity of light is useless, or even harmful, unless it be properly distributed. The considerations which determine the suitability of any lighting system may be divided as follows:—

(*a*) Freedom from glare and from excessive contrast in the field of view.
(*b*) Adequate, but not excessive, diffusion.
(*c*) Correct colour.
(*d*) Correct proportion of local and general lighting.

Much has been written on the subject of glare, but very little that has materially advanced our knowledge of this complicated phenomenon. Glare is closely related to "ocular adaptation," and the remarkable constancy of the least perceptible brightness difference which, as can be seen from fig. 4, exists for a range of field brightness from 0.3 to 300 candles per square foot, is a striking example of the extremely wide range over which the eye is capable of almost complete adaptation. However, (*a*) values of field brightness often met with under artificial lighting conditions lie outside this range of complete adaptation, and (*b*) adaptation, even within a restricted range of brightness, is very far from instantaneous. The time (several seconds) taken for adaptation of the eye is, at least, a contributory cause of "successive glare," *i.e.*, the reduction of visual efficiency which results from allowing the eyes to view a bright source and so become adapted to a brightness level higher than that of the normal working field. The assumption that, as long as there are no sources of light situated in or close to the normal line of view, the lighting system is free from glare is very far from being correct. The eye almost certainly will wander over the whole room up to a certain angle of elevation. The first rule, therefore, for the avoidance of glare deals with the angle

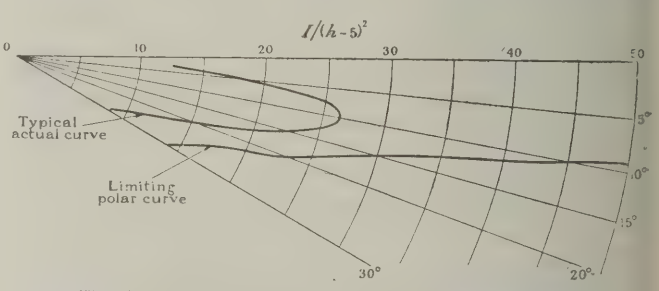

Fig. 5.—Limiting Polar Curve for Street Lighting Fitting.

of cut-off and may be stated thus:—"In any lighting system every light source or other bright surface visible to the eye should have an angular elevation of at least 20 deg., and preferably 30 deg., when viewed from any normal working position."

It has frequently been stated that the limiting brightness tolerable in the field of view is about 3 candles per square inch, and the definition given in the Factory Lighting Committee's report is 5 candles per square inch. Under normal daylight conditions the working illumination is usually much higher than that provided by artificial light, and it may quite well be the fact that to an eye adapted to a working illumination of 20 or 30 foot-candles, a brightness of 3 candles per square inch does not produce any noticeable glare. To the same eye adapted to a working illumination of one-tenth this amount, however, such a brightness in the field of view may produce a very distinct diminution of visual efficiency. The truth is that glare is a continuous phenomenon: it increases with the size as well as with the brightness of the glaring source, and it decreases progressively as this source is removed further and further from the line of fixation; all these conditions being fixed, it decreases as the brightness of the

† A field brightness of 1 candle per m² viewed through a pupil of 1 mm² area gives a retinal illumination of 1 photon.

normal field of view increases. The ideal conditions are those in which there is nothing in the field of view (*i.e.*, less than 30 deg. above the horizontal) brighter than the object requiring attention.

It might be thought that the ideal could easily be achieved by concentrating light on the point of work by means of some local fittings, leaving the remainder of the room in complete darkness, but this is a most undesirable arrangement. When the two fields differ markedly in brightness, the visual efficiency is lower than when both have a brightness equal to the smaller of the two previously employed; thus, when the brightnesses of the two fields are respectively about 7 and 0.3 candles per square foot, the visual efficiency is less than when the brightness of both fields is 0.3 candle per square foot. There must, then, be a further rule that the general level of illumination in the field of view should not be too low in comparison with that of the object requiring attention. The data available on the subject are really insufficient to indicate a figure for the greatest permissible ratio, but it is almost certain that one-twentieth is an outside limit, while one-tenth or even one-fifth is to be preferred. It should not be concluded from the two rules just given that a dead uniformity of brightness is to be aimed at. Moderate contrasts are pleasant; they are in fact the means by which the features in any scene are recognised. If it be allowable to take the contrasts commonly met with in nature as a guide, ratios not exceeding one-tenth are suggested, since the brightness of a grass field is approximately one-tenth that of the sky above it. Absolute uniformity of brightness in the visual field, if attainable, would be most tiring, since the eye would constantly be searching for relaxation and failing to find it. Once again, however, it is necessary to remember the distinction between brightness and illumination.

In every case the fight against glare must be waged with the utmost vigour. To say that surfaces having a brightness of 3 candles per square inch or over must not be tolerated in the normal field of view, may sound like a counsel of perfection to-day. The author ventures to prophesy that in 10 years' time it will be as much a truism as is the statement now that a bare electric lamp should not be visible in any properly lighted room.

(*c*) *Adequate Diffusion.*—The unpleasant effect of the hard shadows cast by a single source of light of small superficial area is familiar to everyone, but an almost complete absence of shadow, although suitable for a few purposes, such as drawing-office work, is most inconvenient for other work, such as sewing, for it is only by means of the shadows cast by the individual threads that the texture of the material can be seen. Each of the three systems, direct, indirect, and semi-indirect, has its own field of usefulness. The brightness of the diffusing material used for the bowls of semi-indirect fittings is generally of the order of 1 to 3 candles per square inch, and it is therefore sometimes concluded that there is no disadvantage in having such fittings within the normal field of view, but this is not the case and such fittings should be hung as high as is permissible.

(*d*) *Suitability of Colour.*—Deliberate colouration of the light involves the sacrifice of some part of the available flux. There is no doubt, however, that for certain purposes a modification of the colour of the light given by the lamps may be of very great advantage.

(*d*) *Correct Proportioning of Local and General Illumination.*—It is sometimes desired to have a very high illumination (of the order of 20 to 50 foot-candles) at the point of work in such fine processes as watchmaking, engraving, &c., and the only solution of the problem is to supplement the general illumination with local lighting. The contrast between the high level of brightness at the point of work and the comparative darkness of the room in general will cause a certain loss of efficiency, but this must be faced; it can be minimised by having the general illumination as high as possible, and in no case less than one-tenth of the illumination provided by the local lighting.

Street Lighting.—It has not yet been decided whether it is more important to illuminate the vertical surfaces of objects in a roadway, or the horizontal surface of the road itself; both are concerned in rendering objects visible to the driver of a vehicle. An object must be seen by contrast with the road surface which forms its background. The brightness of this background is almost certainly variable from one part to another, and the higher the general level of brightness, at least up to a limit of 0.7 candle per square foot (a level much higher than that met with in any street) the more sensitive is the eye to small differences of brightness (see fig. 4), *i.e.*, the smaller the contrast detectable. The conclusion that excellence in street lighting could be achieved by having as high an illumination as possible, with an adequate diversity of brightness so as to ensure a good contrast with objects, whether light or dark, ignores the all-important factor of glare. The following is an attempt to apply such experimental data on glare as we possess to a problem in which glare exercises an almost preponderating influence.

For any source which is of such a size that its maximum linear dimension subtends an angle of less than 3 degs. at the eye, the brightness and the size need not be considered separately, but the glaring effect may be regarded as due simply to the effective candle-power in the direction of view. The glare, then, is governed by the following four factors:—

(*a*) The candle-power in the direction considered.
(*b*) The distance of the source from the point considered.
(*c*) The angle of elevation.
(*d*) The general brightness of the field of view, *i.e.*, in practice, of the street surface.

Since the visibilty of objects depends very largely on the sensitivity of the eye to contrast, take as the criterion of glare the reciprocal of the brightness contrast just perceptible to the eye. This "coefficient of perceptibility" $p = B/(B - B')$, where B and B′ are the brightnesses which can just be distinguished from each other; from fig. 4, the maximum value of p attainable under conditions of "no glare" is about 60 at normal values of brightness. The scale of ordinates on the right of that figure shows how p diminishes as the general field brightness is decreased. The variation of p with the candle-power of the glaring source and its distance from the observer may be expressed by means of a curve showing the relation between p and the illuminatin E produced by the glaring source at the observer's eye. It is necessary to determine the relation between p and the angle α between the lines joining the observer's eye to the glaring source and to the object respectively. A relation may then be found giving p in terms of both α and E; in other words, for constant glare conditions the relation between E and α is fixed. If, further, it be agreed to measure α from the horizontal plane passing through the observer's eye (say, the 5-ft. plane), there is for the fitting a limiting polar curve corresponding to any given mounting, for $\tan \alpha = (h - 5)/d$, where h is the mounting height and d the horizontal distance of the observer from the standard. Further, $E = (I_\alpha \cos \alpha)/d^2$ or, approximately, $E = I_\alpha \alpha^2/(57)^2(h-5)^2$, where α is in degrees. Hence a relation can be found which gives $I_\alpha/(h - 5)^2$ for every value of α. The figures may be put in the form of a polar curve, as has been done in fig. 5, which shows the maximum limiting values of $I/(h - 5)^2$, so that, for a given mounting height, the outer limits of the polar curve are determined for the fitting; alternatively, if the polar curve be fixed, the minimum mounting height may be determined. The above method of limiting the amount of glare must be used in conjunction with a specified street illumination. The figures calculated have all been based on the assumption of a field brightness of not less than 0.07 candle per square foot. Taking the reflection factor of the roadway as of the order of 10 per cent., this means that the average illumination must be at least 0.7 foot-candle. Assuming a round figure of about 9 for the diversity factor, *i.e.*, the ratio of maximum to minimum illumination, this means that the horizontal illumination due to a single lamp midway between the standards must be at least 0.3 foot-candle at the road surface. If the ratio of spacing to height be r, the value of α at the midway point is arc tan $(2/r)$, while the illumination at this point is $(I_\alpha \sin \alpha)/h^2(1+r^2/4)$. This consideration fixes a maximum value of r for a given value of h and a given polar curve.

For example, with a specified minimum illumination of 0.3 foot-candle, fig. 5 shows that the maximum permissible value of r with a mounting height of 15 ft. is about 6.5; with a mounting height of 40 ft., however, r may be nearly as high as 9.

The above treatment of glare in the case of street lighting is novel so far as the author is aware, and, as it was developed in connection with the preparation of a proposed British Standard Specification for Street Lighting, it is an example of an attempt to apply the results of what was primarily a psychological investigation to a practical illuminating engineering problem.

Conclusion.—With the opinion that many modern lighting installations providing an illumination of 3 or 5 foot-candles represent the saturation point, at least so far as load is concerned, the author does not agree. Far higher degrees of illumination will be found advantageous so long as proper care is taken to ensure that the light provided is used in the right way.

It may well be that a proper distribution of the light provided, or a desirable modification of its spectral distribution, may result in a utilisation factor far lower than that commonly attained at the present time. Such an apparently wasteful system may, in reality, be the best when the psychological factors are given due weight in the problem, and there is every indication that the economic value of good lighting is such that even a large increase in lighting costs may be far outweighed by the benefits resulting from increased economic efficiency. It is not too much to say that 90 per cent. of people in this country carry on their work after daylight hours by inadequate illumination and an unsuitable system of lighting. A quadrupled lighting load, properly employed, would result in better health, physically and mentally, and its cost would be trifling compared with the benefits it would confer on every class of the community.

Discussion in London.

Mr. C. C. Paterson opened the discussion by outlining the scope of the British Engineering Standards Association's draft Specification for Street Lighting, which was equally applicable to electric and gas lighting, and referring to the subjective aspect of the subject. The effect on the eye itself was apt to be forgotten, and when considering street lighting the eye was used very near its limit without a factor of safety. The authors of both papers had been very active members of the B.E.S.A. Committee (of which Mr. Paterson was chairman)

that had framed the specification; it had worked for two years with very few data of real value to guide it, but its findings had been unanimous. He appealed to all concerned to read the preface (copies of the draft specification had been handed to all members attending the meeting) carefully, the last paragraph of which was worded as follows:—"There is no doubt in the minds of those responsible for this specification that during the next few years the trend will, and should, be towards higher and better distributed street illumination, and the standards have been set to anticipate the immediate future rather than to stereotype the past." There was at present no criterion to go by in street lighting, no accepted standard, and the Committee had laid down a classification that would not hinder future progress. The mandatory clauses were few and simple, Nos. 8 and 10, which dealt respectively with the classification of installations and the minimum service illumination; all the other clauses had been framed mainly to make the two aforementioned ones practical. The specification was nothing more than a first step, but, if adopted, it would carry the subject forward.

Mr. F. Bailey agreed with the views put forward by Mr. H. T. Harrison in his paper. The City of London's lighting was so good because it had been thoroughly tested and considered; they had had a year's experience of it before it was put into public use. Central suspension of the lamps over the streets was the right method: he had had to alter the design of lamp standards so that when they were knocked down by vehicles they would not fly into pieces, and so that they would know where they would fall, and what they would do when they reached the ground. The quality of the city's lighting was revealed by the number of foreign visitors who came to view it, and their appreciation. England produced the finest plant and did the finest work; a wave of pessimism had spread over the country to which he objected strongly.

Mr. W. J. Jones emphasised the fact that the eye was the final court of appeal. Mr. J. W. T. Walsh's paper teemed with suggestive passages, but with regard to that which implied that a brightness of 3 per cent. would result in glare, care must be exercised when defining the upper limit when diffusing fittings were used; the author had been somewhat adventurous in prophesying the limit of brightness for future fittings, for each installation must be considered on its merits. The speaker looked forward to the time when street lighting would be judged in terms of visibility, and it would not be long, he thought, before such a criterion would be available. "The more light we have amongst us, the happier we will be."

Mr. Leon Gaster was gratified to hear the subject of illuminating engineering discussed before the I.E.E., for it was not so long since he was a "crier in the wilderness." Thanks to the National Physical Laboratory and the scientific research in progress, the subject was now being dealt with in an authoritative manner which would convince the public. He stressed the educational aspect of the matter: there was no justification for anyone to call himself an electrical engineer or architect unless he possessed knowledge of illumination, and illumination engineers had not been able to convince such people that they could help them. Perhaps Mr. J. W. T. Walsh, who was a member of the I.E.E. Council, would draw that body's attention to the need for more illuminating education.

Mr. P. Good was not surprised at the length of time taken by the B.E.S.A. Committee to produce the street lighting specification; valuable help had been rendered by the G.E.C. Research Laboratory and the E.L.M.A. Lighting Service Bureau, and in view of the large amount of work that had been done he thought the Committee had achieved its aim quickly. To put more wires over streets would be a retrograde step. Those concerned with street lighting talked too much about its cost, and it was time they began to talk of its cheapness; three times the present amount of light could be obtained for a very small additional cost. Darkness, dirt, and crime were very closely associated.

Mr. R. C. Fox, speaking as a student, said that totally indirect lighting had a somewhat dismal effect, though it seemed to reduce eyestrain. That the central suspension arrangement was the best form of street lighting was shown by the City of London's installation. It would seem that the side streets merited consideration first, for the illumination of main thoroughfares was contributed to by shop-window light: when the shops closed main-street traffic decreased as people moved homewards through the side streets, thus increasing traffic danger therein due to lack of light. In college he had found a lack of technical instruction on illumination; the subject was inadequately provided for, and most of what he knew about lighting he had had to pick up outside college hours.

Capt. W. J. Liberty was of the opinion that overhead suspension was the ideal method of lighting streets. In Cheapside the number of every motor-car, no matter how fast or slowly it was travelling, could be seen; a pin could be seen on the surface of the road, and one could read a newspaper comfortably. When standards at the roadside were used half the light was wasted on the walls of buildings where it was not wanted. It had been his pleasant duty to distribute the B.E.S.A. specification to town authorities all over England; a conference representative of neighbouring towns had been called by the Sheffield city authorities to urge the official adoption of the specification, which was being given serious consideration everywhere. He hoped that everyone interested in the matter would record his opinion of the specification, so as to assist those responsible for drafting it to form an idea of what was required.

Mr. D. Dixon pointed out that the eye was the final judge, but that which pleased it was not necessarily always good for it. Habit was an important factor, as witnessed the public's general reluctance to employ artificial daylight.

Mr. T. J. Sack thought that Mr. H. T. Harrison's suggested method of suspending street-lighting fittings overhead would prove embarrassing to fire brigades. The present method of allowing motorists to provide their own light on the highways was most uneconomical; it meant that something like 90 million watts were "careering round the country" wastefully. Each car carried its own little lighting system, which cost on an average about £20, representing a total capital investment of about £18,000,000; if that amount of money had been used to build large generating plant, it would have sufficed to provide one light per mile of highway throughout the country.

Mr. J. W. T. Walsh, in reply, remarked that three candles per sq. in. could be intensely glaring. There was a lack of data on glare, but the Department of Scientific and Industrial Research had an investigation on that subject very much in hand, and before long results would become available. Not "the more," but "the better light there is amongst us, the happier we will be." He endorsed what Mr. L. Gaster had said about education and illumination; in the I.E.E. membership examination illumination was at present a part subject only, whereas it should really be made a whole subject. The reason why many people disliked artificial daylight, and characterised it as depressing, was because they did not use enough of it: 20 or 30, even 50, ft.-candles would not be harmful, for they were used to very much higher figures in the case of natural daylight.

Mr. H. T. Harrison, also in reply, explained that the small wires he proposed for overhead street lighting would not be readily visible at a height of 30 ft.; tramway wires were four times as large as those he proposed to employ, and yet people had become accustomed to them. No more obstruction would be caused to fire brigades than was experienced to-day with tramway wires.

Finally, Mr. C. C. Paterson expressed gratification at the manner in which the draft B.E.S.A. Specification for Street Lighting had been received by the meeting, and at the way it was being taken up seriously elsewhere in the country as indicated by Capt. Liberty's remarks.

(To be continued.)

Correspondence.

***Correspondents should forward their communications* as early as possible.** *No letter can be published unless we have the writer's name and address in our possession.*

The "H" Type of Cable.

I have read with interest the letter by Mr. G. H. Nisbett on page 1074 of your December 31st, 1926, issue, and also the replies thereto published in two subsequent issues. While most of the questions have been covered adequately in this correspondence, there are still one or two points which might be mentioned, and I would appreciate a small amount of space in your columns to take up a few of them.

To begin with, Mr. Nisbett is entirely correct in stating that there is nothing very new about Type "H" cable, which dates back to 1914. I may state that my company has been the pioneer in this field. It has held a licence for this form of cable for the United States since 1913, has been investigating its properties since that time, and has been actively engaged in manufacturing Type "H" cables for the voltage range of 25 kV to 35 kV for the last eight years.

I find difficulty in following some of Mr. Nisbett's arguments. The recent work of Farmer, of the Electrical Testing Laboratories at New York, has shown (*Journal* of A.I.E.E., 1926, p. 454) that the weak points of ordinary belted three-conductor cable when exposed for a long time to high voltage are in the filler spaces and at the surface of the conductor insulation towards the cable centre, these regions giving way and carbonising first, and leading to eventual puncture and complete breakdown. He comes to the conclusion that the long-time breakdown strength of cables in which the stress is radial is 50 per cent. or more of that of the belted type of cable.* Obviously the long-time breakdown strength of a cable with radial stresses is not infinitely high, and the mere use of the Höchstädter metallised surfaces does not eliminate all cable troubles. Still, a device which will so greatly increase the breakdown strength for long-time high voltage, or even give an increase very much smaller than that, seems to be well worth while.

Mr. Nisbett claims that Type "H" cable is larger than the belted type. My company has made large quantities of this type of cable and has a large amount in actual successful service. Its general policy is to make the Type "H" cables at least as small as a comparable belted cable, because it is possible

* As written; apparently it should read "50 per cent. more than that," &c.—Eds.

to use the conductor insulation in a more rational way, and therefore use higher stresses. The alleged mechanical difficulty of cabling together the three conductors without a surrounding belt has been entirely satisfactorily solved by methods we have employed.

The question of relative current-carrying capacities in Type "H" and belted cables does not seem to be entirely clear in the correspondence, possibly because there has been too much generalisation. To draw any conclusion, it is necessary to know how the metal is applied to the insulated conductors, how thick it is, what its thermal resistivity is, and how many adjacent cables there are. Our own policy is normally to use around each of the insulated conductors copper foil about 0.003 in., which is usually specified in this country. We then apply over the three twisted conductors a thin steel foil, so that the metal coating of the conductor insulation is in general in thermal contact with the lead sheath. Using this construction, and in view of the fact that copper has about double the thermal conductivity of aluminium, we find that the temperature rise of the conductors above the lead sheath for a given size of conductor and current is about half as much in a Type "H" cable as in a belted cable. The actual percentage gain in current-carrying capacity is, of course, a function of how large a percentage the rise between conductors and lead is of the total rise of the conductors, which depends upon conditions of installation, number of adjacent cables, &c.

With regard to the relative dielectric losses, there are two points of view. The first is probably the more important, namely, that, due to the better design of the Type "H" cable, the ionisation curve is likely to be flatter, and thus the power factor of Type "H" cable at high voltage will be lower than that of a belted cable. Any such difference is also likely to be accentuated further during service when the cable has been put through temperature cycles, resulting in still further ionisation and high power factor and loss for the belted type of cable.

Neglecting the higher ionisation losses in belted cable, we may, however, consider the relative losses in a Type "H" cable and a belted cable on the basis of equal power factor of insulation. On this basis, we usually find that the loss in the Type "H" cable is slightly higher than that in a belted cable, due to the fact that higher working stresses may be used in the Type "H" cable. However, the main effect of dielectric loss is a reduction in permissible current-carrying capacity due to the heating from dielectric loss, and the excellent thermal characteristics of the Type "H" cable more than compensate for the slightly higher losses therein, resulting in a total temperature rise due to dielectric loss (regardless of conductor losses) less for Type "H" than for a belted cable.

The reason for this is twofold. To begin with, the temperature rise between conductor and lead of a single-conductor cable or of a Type "H" cable is half as much for a given loss in the dielectric as for the same loss in the conductors (Archiv für Elektrotechnik, 1922, Vol. 11, p. 68), while it is approximately the same for both types of losses for a belted cable. Furthermore, as stated above, the thermal resistance between the conductors and lead of a Type "H" cable properly designed is about half of that in the corresponding belted cable. These two facts together mean that the temperature rise between conductors and lead due to dielectric loss for a Type "H" cable is about *one-quarter* that of the belted cable, and the usual effect of this is to make the total temperature rise due to dielectric loss for a Type "H" cable less than that in a belted cable, even neglecting the increase of power factor and loss in the belted cable due to ionisation.

Donald M. Simons,
Development Engineer, Standard Underground Cable Co.

Pittsburgh, Pa., *February 21st*, 1927.

Extra-High-Pressure Transmission.

Mr. A. T. Scott's letter in your issue of February 25th is not by any means a complete answer to mine in the issue of February 7th. He ignores the point I made that two overhead lines at, say, 33,000 volts, can be provided at less than the cost of one underground cable. One might develop this further. It is admitted that a single 33,000-volt cable is not reliable enough. Would two overhead lines be considered adequate? If so, the question is settled. If not, why not have four overhead lines, which will be cheaper than two underground cables? Surely four overhead circuits will be safe, or even three with specially large insulators.

Having in mind recent e.h.p. cable troubles, I deny that overhead construction practice has not kept pace with cable design.

Mr. Scott's statement as to the cleaning of all insulators being necessary eventually is interesting, but I hope inaccurate. In this country we get rain at least once a month, and this means that we have an insulator with half its surface cleaned each month without the help of a cleaning gang. The surface exposed to rain may be made sufficient to resist wet flash-over, assuming the under surface to be so dirty that it is ineffective; such an insulator will not flash over in a fog, even after a long spell of dry weather, during which it has become dirty.

It is known that 3,300-volt and even 6,600-volt insulators never need cleaning in England in open country, even in manufacturing districts, and I have many 33,000-volt insulators which have not been touched for 3½ years. These are in a mixed residential, manufacturing, and agricultural area, and they are only "2-shed." We have had to change some near railways, chemical works, &c., for the "3-shed" type, and none of these has, so far, flashed over. Any real quantitative information which can be obtained on this subject will be welcome, but we hope to be spared qualitative generalities such as those Mr. Scott has provided.

It is interesting to find that Mr. Scott has been misled by my reference to G.P.O. practice, because I purposely followed his indirect form of expression on this point. It shows how desirable it is to adopt downright and forthright methods. I understand that the Post Office has found underground cables unsatisfactory for trunk lines, and declines to put important lines underground whenever they can go overhead. In other words, while Mr. Scott may have been right in advising us to follow its example, he was wrong in imagining its policy to be one of putting important routes underground.

W. Fennell.

Northwich, *February 28th*, 1927.

The Earthing of Portable Domestic Appliances.

I am afraid Mr. Joseph has missed the point of my article. It is not a case of "making too much fuss about the whole business," but rather a matter of giving complete satisfaction to the owner of the installation.

I am all against unnecessary restrictions and regulations; we suffer from a surfeit of them already in the electrical industry. But since most, if not all, of the fatalities in private houses due to electric shock have occurred in bathrooms, it is incumbent on the profession to make the use of electrical appliances in such places as safe as possible, and I think the majority of engineers will agree with me on this point.

As regards rendering portable appliances safe in bathrooms, this usually means earthing, since, with the majority of apparatus, it is impossible to enclose the metallic framework completely with insulating material. This can only be done effectively by using a 3-core flex with a 3-pin earthed plug-socket, because if the ordinary 2-pin plug-socket is used and a separate earthing lead is installed, the latter connection may be forgotten or overlooked when the appliance is plugged in. Therefore, when a plug-socket is to be fixed in a bathroom, it must of necessity be of the 3-pin type, and this is just where the disadvantage and inconvenience to the owner of the installation comes in. If all the other plug-points in the house are of the 2-pin type (and from the point of view of safety there is no reason why they should not be) apparatus used in the bathroom cannot be utilised in the other rooms, and *vice-versa*. Numerous consumers have complained to me of this decided disadvantage. Naturally, they wish to be able to use any particular appliance in any part of the house and not to be restricted to certain rooms.

The only way out of this difficulty, in my opinion, is, as I have suggested, to provide 3-pin plug-sockets at all plug points. Apart from the bathroom, or other situations where a shock to earth is thought to be dangerous, it is not necessary to connect the third socket to earth, although if lead-covered wiring or steel conduit is used it would take very little more labour to make such a connection. If C.T.S. is used for the installation, my method would be to provide 3-pin plug-sockets throughout and only make an earth connection from a convenient water pipe to the socket fixed in the bathroom.

Therefore, in my opinion, the whole thing boils down to this: If no plug is required in the bathroom, 2-pin plug-sockets will suffice throughout the house; but if portable apparatus is to be used in the bathroom (and with the ever-increasing use of electricity it will undoubtedly be wanted in such places in the near future), then 3-pin plug-sockets must be fitted in all the rooms for the purposes of interchangeability.

I am glad "A.M.I.E.E." supports my views. He complains, however, that some supply authorities do not apparently practise what they preach, by not earthing their supply services and meters. I can assure him, nevertheless, that owing to the special nature of such gear, opinion is very much divided on the advisability of earthing this particular class of apparatus.

Reg. H. Rawll, A.M.I.E.E.

Birmingham, *March 1st*, 1927.

Kiosk-type Sub-Stations.

As manufacturers of kiosk-type sub-stations, we were interested in the remarks of your correspondent "P.M.W." on this subject in your issue of February 25th. We have always appreciated the fact that adequate screening of e.h.p. parts is essential, and would refer your correspondent to the article on our design of kiosk in your issue of December 17th, page 1009. The illustration clearly shows that not only has the e.h.p. apparatus been screened from accidental contact from the outside of the kiosk, but the various circuits and apparatus have been partitioned off so that adequate protection is given when working on any section. We do not favour the interlocking of kiosk doors, as this gives a false idea of security. A very elaborate system of interlocking and the earth-

ing of the power transformer, both on the e.h.p. and l.p. sides, would have to be undertaken to give really complete foolproof protection. Totally enclosed metal-clad e.h.p. switchgear has been advocated, but whilst this is good in principle, capital cost in the big majority of cases rules it out. We trust that "P.M.W." will now appreciate that even if our contemporaries have not pleased him, we always give attention to the points he raises.

We will certainly provide our customers with all essential safeguards, but it should be recognised that much is asked and but little paid, for anything in the way of super safety devices sometimes specified and sometimes only suggested as an afterthought.

W. H. Holding.

Manchester, *March 1st*, 1927.

Your correspondent "P.M.W." will perhaps be interested to learn that at least one manufacturer is in a position to meet the conditions laid down by him, at an economic price, by completely immersing not only the automatic switches, but also the isolators (which are of the quick-make-and-break type), bus-bars, current transformers, &c., in oil.

The e.h.p. switchgear is in the same compartment of the kiosk as the transformer, and there is no necessity for the added complication of interlocked doors. The l.p. gear is in a separate compartment entered by a special door at the side.

There is absolutely no risk of accidental contact with the e.h.p. apparatus, and, further, cleaning of bus-bars and isolating switches, together with their insulators, is entirely eliminated; also the gear is unaffected by deleterious atmospheric conditions.

This switchgear has been successfully in service in this country for the past seven years, and is available for the largest capacity systems. The writer would be glad to furnish full details to "P.M.W." or any other engineer interested.

P. Nutter,
Engineer, Coq Switchgear Co.

Newcastle-on-Tyne, *February 26th*, 1927.

A Metering Problem.

It is rather difficult to diagnose the trouble experienced by your correspondent "E.H.K.P.," because, as is almost unavoidable in cases of this nature, all the information necessary to ensure arrival at the correct conclusion is not available. However, the appended remarks may be of some interest.

(1) It would appear that the Supply Authority, being convinced that the Aron meter was registering considerably less energy than was supplied to the consumer, was confronted with the problem of metering the load correctly, and, at the same time, convincing the consumer that the Aron meter readings were hopelessly low.

Presumably, to serve this dual purpose, a carefully calibrated Sangamo equipment was then installed with the Aron meter operating from the same instrument transformers. Admittedly, the introduction of the additional load of the Aron meter would interfere with the fine accuracy of the Sangamo equipment and the Aron meter would not be compensated for the ratio and phase-angle errors of the Sangamo transformers, but the inaccuracies thus introduced would be negligible compared with the difference in reading of 4,000 units—approximately 10 per cent. of the energy consumed by the factory when working at full load for seven 24-hour days. Apparently, therefore, the Supply Authority justified its contention regarding the inaccuracy of the Aron meter.

(2) Although the introduction of the third meter is not explained, probably the consumer would not admit that the Company had proved its case, and the third meter was put in circuit with the other two in order to "make assurance doubly sure." We are told, however, that none of the three meters read alike, but the most important information—namely, the *percentage* inaccuracy of the third meter, taking the Sangamo meter as correct—is not given.

It is quite possible for there to be a considerable difference in the actual readings of two meters, both of which are accurate within prescribed tolerances. Let us assume that, when all three meters were in circuit, the Sangamo meter was 2½ per cent. fast and the third meter 2½ per cent. slow. If the actual units consumed during the test period were 24,000 (approximately half load on the factory for seven 24-hour days), the Sangamo meter would read 24,600 units, and the third meter 23,400 units—an actual difference of 1,200 units. Although both meters would be within the limits prescribed by the B.E.S.A. specification for meters calibrated with their instrument transformers, it is easy to see that, without some explanation, the Company would have difficulty in persuading its client that a difference of over 1,000 units was permissible in the readings of two meters claimed to be accurate.

(3) Provided that the difference in the readings of the two check meters was of an order which could be accounted for by some explanation such as that given above, the Company's proposal to charge the consumer for the period when the Aron meter was in circuit on the basis of the units registered by the Sangamo meter during a similar period would appear to be the fairest method of dealing with the matter, since the Supply Authority could hardly be expected to present the consumer with energy at the rate of 4,000 units per week, even for a short period, and, in addition, bear the expense of the preparation and installation of check outfits. Of course, the most convincing way of demonstrating the inaccuracy of the Aron equipment would have been to have left the complete outfit in circuit and installed the complete Check Sangamo equipment alongside it, but, possibly, conditions on site precluded the adoption of this method.

(4) To guard against troubles of this nature it is very useful for consumers who take a heavy load to install their own meters on the various sub-circuits. The summation of the readings of these meters then serves as a useful check on the Supply Company's meter, and, moreover, the individual meter readings are very valuable for departmental costing purposes.

(5) One method of simplifying the equipment installed in the case under consideration would be to use meters with pressure coils connected directly to the line. Several manufacturers of high-grade polyphase watt-hour meters arrange the pressure coils of their meters suitable for direct connection to voltages up to and including 650 across phases.

Frank Rostron.

Oldham, *March 4th*, 1927.

I read with great interest in your "Correspondence" columns the letter on the subject of "A Metering Problem." I am more than surprised to notice that the test department that is responsible for the accuracy of meters on consumers' circuits appears to treat this subject so lightly. I should like to point out the utter foolishness of connecting two different meters on the same current and potential transformers, when they were designed for their own transformers.

Further, the error was increased by inserting a portable test meter again on the transformers which were already wrongly connected, so obviously the test was useless. The subject of metering is most important for consumer and supply company also.

We all like to know what we are paying for, so the test departments should possess men that know what they are about.

D. M. Duncan.

Walthamstow, *March 4th*, 1927.

A Knotty Problem.

Your correspondent "Perplexed" is like the man who could not choose a suit owing to the tailor showing him too many patterns.

As an experienced electrical contractor, however, I should certainly plump for C.T.S. of the original manufacture. This system is the cheapest and best. It is ideal for wiring buildings already occupied, as it disturbs the place least, takes up very little room, and is quickly installed—hence the cheapness.

If "Perplexed" should be in the Manchester area I should be happy to quote him for his work and assure him that the work will be to his present and lasting satisfaction.

J. H. Fletcher.

Manchester, *March 3rd*, 1927.

Power Supply for Wireless Sets.

I note the further letter from "Interested" in your issue for March 4th, and see therefrom that your correspondent is apparently prepared to go further with the matter of a comparative test.

It will be remembered that your correspondent claimed "equal performance." The first test which I would suggest is a simple aural one. Obviously the sets must be compared on the same loud-speaker, and since their output impedance probably differs this is difficult to arrange. I therefore suggest that the output from each set be switched in turn on to a choke-coupled high-power amplifier of first-class quality, the output of which is applied to a Rice-Kellogg loud-speaker. Should your correspondent agree to carry out the test, I hope that I may be able to obtain permission to use apparatus of this type which I know to be in the possession of Messrs. Burndept. The amplifier in question has a substantially flat response curve between about 40 and 9,000 cycles, and can deal with input swings up to 120 volts or more. If the last valve of "Interested's" set is of higher impedance than that in the set which I propose to try against it, I should of course agree to his using a larger coupling choke in proportion, in order that the frequency response of the amplifier may be the same in either case. In this way it will be simple for both sets to be tested under the same conditions, *viz.*, with an output swing of about 150 volts, which is the maximum undistorted swing obtainable on my set.

Since the test is essentially one of *quality of reproduction*, it is of course essential that it should be carried out quite near to the broadcast station, in order that no questions of strength or selectivity should enter into the test conditions. If "Interested" agrees, I would suggest asking permission of Messrs. Burndept Wireless, Ltd., to carry out the test in their research department. Arrangements would, of course, be made for those who are to judge the quality to listen to the sets with rapid change-over arrangements, and without knowing which set is in operation.

I feel myself fairly confident that the results of trying to obtain output swings of 150 volts with only 120 volts h.p. will definitely convince "Interested" that his claim to equal performance cannot be maintained. If this is not the case, however, it will be necessary to carry out further tests. These

should comprise (1) a measurement test on pure sine-wave input, so as to obtain a frequency response curve of the type given in my original article, and (2) some form of wave-form test at an output of about 150 volts swing. Unfortunately, I do not know where I can obtain the loan of an oscillograph, which would be the simplest method of making this test, but failing this there is a fairly simple method of finding whether there are any strong harmonics, details of which I will give you if you desire them.

It will, of course, be appreciated that "Interested's" claim for equal performance must be interpreted to mean (1) that in spite of its three transformers, his set will reproduce notes in the extreme bass (*i.e.*, down to 30 cycles) as well as the one which I shall produce, and (2) that in spite of its limitation to 120 volts h.p., his set will give no more wave-form distortion than mine, with an output swing of 150 volts in each case.

P. K. Turner.

Blackheath, *March 4th*, 1927.

What is it to Drive?

We are surprised to read in the article under the above heading in your issue of March 4th, that purchasers of motors are recommended to add 20 per cent. to published horse-powers, as machine makers cut the horse-power to a minimum, leaving no safety margin.

This may be necessary when one is purchasing motors from Continental manufacturers, or certain manufacturers in this country who deliberately cut their ratings, but if motors are purchased from reputable firms who not only promise on paper that their motors comply with B.E.S.A. 168 but deliver motors that on test do comply with this specification, then there is no need for the distrust in ratings which your correspondent implies.

On a.c. motors particularly, it is inadvisable to adopt the course he suggests, as otherwise power factors tend to be low when the motors are running on light loads.

The Lancashire Dynamo and Motor Co., Ltd.

G. E. Mason, *Director*.

Manchester, *March 5th*, 1927.

[The "published horse-power" in question is, of course, the rating of the machine that is to be driven by the motor.—Eds. Elec. Rev.]

The Salaries of Engineers.

May I express complete agreement with the remarks on the above subject by your two previous correspondents?

"Yet Another Poor Blighter" suggests that the I.E.E. Council should consider the advisability of fixing minimum salaries for electrical engineers; may I go a step further, and suggest that a little critical self-examination on the part of members who occupy administrative positions in manufacturing companies might go a long way in improving the monetary reward given to members of their technical staffs?

Having in mind the highly critical capabilities of members, displayed at meetings of the I.E.E. on technical subjects, it seems a pity that a discussion has not been raised on electrical engineers' salaries; it would be an amusing, if somewhat pathetic, sight, to see some of the aforementioned administrators endeavouring to explain away the fact that many qualified members of their technical staffs were receiving "salaries" considerably less than hands employed in their workshops, and this in spite of the ever-increasing dividends paid by companies manufacturing electrical equipment.

And Yet One More.

March 4th, 1927.

Published Specifications.

Compiled expressly for this journal by a firm of Chartered Patent Agents. The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1925.

16,174. "Thermo-electric generators for energising the filament and plate circuits of wireless receiving sets and the like." H. A. Roberts. March 22nd, 1926. (269,519.)

19,981. "Method of producing high permeability in magnetic material." Standard Telephones and Cables Ltd. (Bell Telephone Laboratories, Inc.). August 8th, 1925. (265,642.)

22,486. "Electric switches." J. C. White. September 9th, 1925. (265,645.)

23,398. "Mechanism for operating electric oil switches or for analogous purposes." J. G. Statter and G. S. Marston. July 12th, 1926. (265,647.)

23,841. "Traffic control lamps." M. J. Raymond. December 30th, 1925. (265,648.)

25,260. "Current rectifiers." L. Levy. October 9th, 1925. (265,652.)

25,277. "Telephone systems." Automatic Telephone Manufacturing Co., Ltd., and J. E. Ostline. October 9th, 1925. (265,653.)

25,611. "Telephone systems." Automatic Telephone Manufacturing Co., Ltd., and A. J. Ray. October 13th, 1925. (Addition to 246,550.) (265,657.)

26,498. "Safety apparatus for electrically-driven pumps." Rees Roturbo Manufacturing Co., Ltd., and C. F. Bekenn. October 22nd, 1925. (265,660.)

27,023. "Remote control systems." Coventry Automatic Telephones, Ltd., and J. E. Collyer. October 28th, 1925. (265,661.)

27,048. "Loud-speaking telephonic apparatus." M. Graham and A. Graham (legal representatives of F. A. Graham, deceased). October 28th, 1925. (265,662.)

27,663. "Automatic and semi-automatic telephone systems." Standard Telephones and Cables, Ltd., J. H. E. Baker, A. J. Chanter and W. R. Moscrip. November 3rd, 1925. (265,666.)

27,782. "Telephone systems." Standard Telephones and Cables, Ltd., J. H. E. Baker and J. R. Hardwick. November 4th, 1925. (265,668.)

28,031. "Electrolytic oxidation of organic compounds." C. H. Field. November 7th, 1925 (265,672.)

28,153. "Maximum-demand meters for alternating current." G. F. Shotter and E. W. Hill. November 9th, 1925. (Cognate application 19,016/26.) (265,673.)

28,191. "Grid leaks, variable condensers, and resistances for use in connection with radio apparatus." R. H. Winter and H. C. Daly. November 9th, 1925. (265,676.)

28,216. "Telephone systems." Standard Telephones and Cables, Ltd., J. H. E. Baker and J. R. Hardwick. November 9th, 1925. (265,678.)

28,303. "Electric heating units." L. Satchwell. November 10th, 1925. (265,684.)

28,625. "Amplifier for four-wire connection with heavily loaded lines." J. W. Kirkland (Allegemeine Elektricitäts Ges.). November 13th, 1925. (265,693.)

28,674. "Automatic and semi automatic telephone systems." Standard Telephones and Cables, Ltd., R. A. Moir and G. C. Hartley. November 13th, 1925. (265,695.)

28,779. "Control knobs." P. C. Rushen (Pacent Electric Co., Inc.). November 14th, 1925. (265,698.)

28,968. "Braking of vehicles and more especially of electric tramway and other cars." W. E. Ireland. November 17th, 1925. (265,700.)

29,187. "Crystal receiving sets." H. F. Pattinson, C. T. O'Callaghan and W. C. Waghorne. November 19th, 1925. (265,705.)

29,330. "Manufacture of evacuated vessels such as thermionic valves." General Elctric Co., Ltd., and S. M. Duke. November 20th, 1925. (265,711.)

29,403. "Electric switches." J. B. Tucker. November 21st, 1925. (265,712.)

30,128. "Deviation indicating apparatus for railless vehicles for overhead wire electric traction." Brecknell, Munro & Rogers, Ltd., and A. M. Willis. November 28th, 1925. (265,722.)

30,433. "Electromagnets and solenoids." H. Cooch. December 2nd, 1925. (265,725.)

31,187. "Telephone systems." Siemens Bros. & Co., Ltd., and H. E. Humphries. December 10th, 1925. (265,732.)

31,802. "Holders for electric incandescent lamps." W. E. Grant and M. B. Bean. December 16th, 1925. (265,739.)

31,919. "Dynamo-electric machines." J. A. Kuyser and Metropolitan-Vickers Electrical Co., Ltd. December 17th, 1925. (265,740.)

32,346. "Sockets for receiving and supporting plug-in vacuum tubes." Igranic Electric Co., Ltd. (Cutler-Hammer Manufacturing Co.). December 22nd, 1925. (265,743.)

32,483. "Vapour condensers." H. L. Guy and Metropolitan-Vickers Electrical Co., Ltd. December 23rd, 1925. (265,745.)

1926.

502. "Illuminated signs." E. J. Mathews. January 7th, 1926. (265,751.)

3,796. "Means for containing and connecting electric batteries." H. A. Yoward. February 10th, 1926. (265,773.)

4,263. "Electronic discharge devices." Raytheon Manufacturing Co. March 5th, 1925. (248,721.)

7,032. "Electric lamps." T. J. Digby. March 13th, 1926. (265,801.)

8,433. "Multi-channel telegraphy." F. E. Pernot. August 15th, 1925. (Divided application on 20,528/25.) (265,806.)

8,866. "Intermittently operating electric regulators." Allmanna Svenska Elektriska Aktiebolaget. April 3rd, 1925. (250,257.)

9,441. "Telegraph submarine cable with loading coils." Felten and Guilleaume Carlswerk Akt. Ges. June 11th, 1925. (253,483.)

10,779. "Electrical condensers." Dubilier Condenser Co. (1925), Ltd. December 29th, 1925. (263,736.)

11,703. "Means for closing and disinfecting the mouthpieces of telephone transmitters." W. H. Wintle. May 4th, 1926. (265,823.)

12,642. "Process for the electrolytic separation of metallic chromium." R. Appel. May 17th, 1926. (Addition to 259,118.) (265,833.)

14,248. "Inductance coils." M. Barengolz. June 7th, 1926. (265,836.)

14,570. "Illuminated signs." Patent-Treuhand Ges. für Elektrische Gluhlampen. October 31st, 1925. (260,548.)

16,459. "Method of manufacturing hollow conductors." Dr. A. L. Mond (Metallbank und Metallurgische Akt. Ges.). June 30th, 1926. (265,849.)

16,559. "Electron discharge apparatus." British Thomson-Houston Co., Ltd. July 1st, 1925. (254,731.)

18,261. "Protection of supply systems from high voltage surges and the like." Sieverts Kabelverk, M. Sieverts Fabriks Aktiebolag. August 18th, 1925. (257,236.)

20,172. "Control systems for dynamo-electric machinery." Metropolitan-Vickers Electrical Co., Ltd. August 25th, 1925. (257,595.)

21,432. "Electromagnetic operating means." British Thomson-Houston Co., Ltd. August 31st, 1925. (257,632.)

24,238. "Electrical apparatus for heating liquids." Santon, Ltd., and H. C. Sanders. October 1st, 1926. (265,883.)

29,055. "Wireless telegraphy and telephony." Marconi's Wireless Telegraph Co., Ltd. November 18th, 1925. (261,758.)

29,525. "Oil-cooling means for oil-immersed electrical apparatus." Maschinenfabrik Oerlikon. December 2nd, 1925. (262,414.)

Trade Mark Applications.

The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from March 2nd. In the case of foreign applications, the names and addresses of the British representatives are also given:—

Supronic. No. 476,822. Class 5. Wire.—L.P.S. Electrical Co., Ltd., Avenue Road, Acton, W.3.

Pyromic. No. 477,406. Class 5. Unwrought and partly wrought metals used in manufactures.—Telegraph Construction and Maintenance Co., Ltd..

S.S. Protos (lettering and design). No. 472,257. All goods in Class 6. No. 472,258. All goods in Class 8. No. 472,259. All goods in Class 13. No. 472,260. All goods in Class 18. No. 472,261. All goods in Class 22.—Siemens-Schuckertwerke Gesellschaft, Berlin. (Haseltine, Lake & Co., 28, Southampton Buildings, W.C.2.)

Paradyne (lettering and design). No. 471,276. Class 8. Radio and electrical apparatus and sound-reproducing instruments.—Paradyne Manufacturing Co., 27, Elgin Road, Seven Kings, Essex.

Silveroid. No. 473,533. Class 8. Instruments and apparatus made from a nickel alloy.—Henry Wiggin & Co., Ltd.

Ton (lettering and Bear design). No. 475,122. Class 8. Parts of apparatus for radio-telegraphy and telephony, but not including electric cells and batteries or goods of a like nature.—C. F. & H. Burton, Bernard Street, Walsall.

Ohmrat Rut. No. 475,205. Class 8. Instruments and apparatus for use in radio-telegraphy and telephony.—Naamlooze Vennootschap Ramie Union, Enschede, Holland. (J. Martin Blair, Amberley House, Norfolk Street, Strand, W.C.2.)

Macilaphone. No. 476,584. Class 8. Telephone transmitter attachments for muffling sound.—E. McCann, Thanet House, 231, Strand, W.C.2.

Ancahe VI (lettering and design). No. 476,556. Class 8. Electric cables.—Callender's Cable and Construction Co., Ltd

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

AYR.—352 houses, for Corporation; burgh surveyor.

AYRSHIRE.—Extension to hosiery manufacturing company's factory at Irvine (£6,500); the manager. Entertainment pavilion, four verandahs, shelters, &c. (£4,000), for Town Council of Saltcoats; burgh surveyor.

BARTON-ON-IRWELL (Manchester). — Hospital, Davyhulme (£92,000), for the B.G.; the clerk.

BECKENHAM.—60 houses, Elmers End estate; Universal Housing Co., Ltd.

BEDDINGTON AND WALLINGTON.—Housing scheme (40), Bute Road estate, for the U.D.C.; S. F. R. Carter, surveyor.

BEXHILL.—Houses, Warwick Road and Cooden Drive; J. E. Maynard, Collington Avenue. Subway, Terminus Road, for Corporation and railway company; R. Robinson and Co.

BIRMINGHAM.—Museum; Corporation Museums Committee.

BLACKPOOL.—Extension of Victoria Hospital (£100,000); J. S. Gibson & Gordon, architects, Old Bond Street, London.

BOLTON.—182 houses, Moorfield estate; A. Braithwaite and Co., Ltd., Leeds. 102 houses, Moorfield estate; J. W. Lee, Ltd., Chorley.

BOURNEMOUTH.—Schools, Moordown, for the managers of St. Walburga's Roman Catholic schools; Preston and Redman, architects.

BRADFORD.—326 houses for Corporation at No. 6 housing scheme (Eccleshill); city architect, Town Hall.

BRIGHTON.—Reconstruction of Richmond Street and Circus Street schools (£20,500), for the borough E.C.; director of education.

BURSLEM.—Electrical installation, New George Hotel; Longden & Venables, architects.

CAMBORNE (Cornwall).—Additional 50 houses, for the U.D.C.; surveyor.

CHELMSFORD.—Additional 50 houses, for the T.C.; borough engineer.

CHISLEHURST.—Factory, offices, &c., Cray Road, for the Crittall Manufacturing Co., Ltd., Braintree.

DALSERF.—Additional 50 houses, for Lanarkshire C.C.; housing architect.

DEAL.—Additional housing scheme (48), for the T.C.; borough surveyor.

DEWSBURY.—Infirmary (£90,000); Infirmary Board.

DUDLEY.—Highway depôt extension, Griffin Street, borough engineer.

DUNDEE.—Two schools, for education authority; master of works.

FORRES.—Reconstruction of mansion, for Sir Alexander Grant, Edinburgh; Mr. Alastair MacDonald, architect, London.

GUILDFORD.—Council offices, with central heating, for the R.D.C.; J. W. Wilton, surveyor, Market Chambers, Onslow Street. Extensions, Haydon Place; Guildford Glass Works.

HAMILTON.—Town planning scheme, including 44 houses; burgh surveyor.

HATFIELD.—Additional 40 houses, for the R.D.C.; A. Sidwell, surveyor.

HIGH WYCOMBE.—Municipal offices, for the R.D.C.; C. H. Wright, architect, 3, Bourbon Street, Aylesbury.

HOLMFIRTH.—Children's ward, Holme Valley Memorial Hospital, with electrical work; P. N. Brown, architect, Hollowgate. Warehouse, Ford Mills; Kirk, Sons and Ridgway, architects, Market Place, Dewsbury.

HONITON.—84 houses, for the R.D.C.; clerk to the Council.

HULL.—Technical college (£150,000); Education Committee.

HUNTINGDON.—Showrooms and offices, for the Hunts., Cambs. and Beds. Electricity Co., Ltd.; Pettits, Ltd., builders.

ILKLEY.—56 houses; borough engineer.

KINGSTON-ON-THAMES.—Additional 58 houses, for the T.C.; borough surveyor. Boys' schools (£41,850), for Surrey E.C.; W. W. Finny, secretary.

LANCASTER.—146 houses, various estates; borough engineer.

LICHFIELD.—Extensions, including assembly hall, dining hall, laboratory, &c., Friary school, for Staffs. E.C.; F. A. Hughes, director of education, Stafford.

LINCOLN.—Extensions (new pavilion), city hospital, for the T.C.; S. C. Baggott, city engineer.

LONAN.—Schools (£13,450), for Isle of Man E.C.; William McArd, builder, Port Erin.

LONDON (Barking, E.).—Wesleyan mission hall (£52,000); Gelder & Kitchen, architects, Hull; Myall Bros., builders, Ilford. 40 houses, Hertford Road; Scriven and Huxtable. Electrification of additional machinery, Barking Town Works; W. Warbe & Co. Sewerage and electric pumping plant; U.D.C. surveyor.

(Becontree, E.).—Synagogue, Becontree Avenue; Hebrew Congregation.

(Ilford, E.).—Modernising lighting on stage, Town Hall; borough engineer. Isolation Hospital extensions; borough engineer. Church, Eastern Avenue; G. Baines and Sons.

(Leyton, E.).—Schools, Canterbury Road (£18,850), for the Borough E.C.; director of education.

(Walthamstow, E.).—36 houses, Forest Road; U.D.C. surveyor.

(Whitechapel, E.).—Roman Catholic central school, Lucas Street; Canon T. J. Ring.

(Highgate, N.).—Extensions, Furnishing Trades Benevolent Association's Homes (£10,000); secretary.

(Cricklewood, N.W.).—Garage and showrooms, Willesden Lane; G. A. Sexton & Son. Boiler house and chimney stack, North Circular Road, for Allen-Liversidge, Ltd.; Heron, Rogers & Pettit.

(Willesden, N.W.).—Extensions for McVitie & Price, Ltd., Waxlow Road; Willard, Son & Ellingham.

(Bermondsey, S.E.).—Motor buildings, Riley Street, for Henry Grant & Co., Ltd.; W. Figg.

(Rotherhithe, S.E.).—Flats, Boss Street, for Courage and Co., Ltd.; F. M. Kirby.

(Wandsworth, S.W.).—Housing scheme (80), for the T.C.; surveyor.

(Wimbledon, S.W.).—Catholic church, Arthur Road; Elkins and Co., Ltd.

MANCHESTER.—College of Technology; Education Committee (competition for designs).

MERTHYR.—Housing schemes for borough architect (300).

MILTON REGIS (Kent).—Municipal offices, for the U.D.C.; surveyor.

NEWRY (Co. Down).—40 houses for the U.D.C. (£11,000).

NEWTON ABBOT.—54 houses at Broadlands Housing Estate, for the U.D.C.

PORTSMOUTH.—Extensions, Grammar School (£20,000), for the governors; the clerk. New R.C. church at Cosham, and central hall; Rt. Rev. W. T. Cotter, St. John's Cathedral.

PUDSEY.—96 houses for Corporation, at Southroyd Park Estate; Basil H. Noble, borough surveyor, Town Hall.

RAMSEY.—Secondary schools, for Isle of Man E.C.; director of education, Douglas.

SEAHAM HARBOUR.—Housing scheme (80), for the U.D.C.; J. B. Abbey, surveyor.

SHEFFIELD.—Café, sale-room, offices and house, Exchange Street and Waingate; Brightside and Carbrook Co-operative Society, Ltd. Market hall (£35,000), near Exchange Street; city architect. 175 houses, Wadsley Hall Estate; Sutton trustees.

SOUTHAMPTON.—Hostel for Seamen; secretary, British Sailors' Society. Additional block, South Stoneham House, Swaythling, for University College; G. Grant, registrar.

SOUTH SHIELDS.—55 houses, Mortimer Road; T. A. Page and Son, architects.

STOKE.—Laboratory, water cooling tower, pump house and reservoir, Michelin Works; Michelin Tyre Co.

STOURBRIDGE.—Wesleyan church (£10,000); Crouch, Butler and Savage, architects, Birmingham.

WOLSTANTON (Staffs.).—Electrical installation, Chelmsford Road; Burslem and District Co-operative Society, Ltd.

The

Electrical Review

VOL. C. MARCH 18, 1927. No. 2,573

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

Electric Street Lighting.

IT was somewhat of a departure for two such papers as those by Mr. J. W. T. Walsh and Lieut.-Commander Haydn T. Harrison to be presented before the Institution of Electrical Engineers, for the discussion of illumination has taken place mainly before the Illuminating Engineering Society since it came into being about 17 years ago. The fact that it is possible to devote so much attention to illumination, and to attempt standardisation in lighting matters, is due mainly to the pioneering work carried out during those 17 years.

Readers of Mr. Walsh's paper (which was abstracted last week) will perhaps hardly form an adequate idea of the part which this Society has played in developing the subject of illumination, though in Mr. Harrison's paper (an abstract of which will be found elsewhere in this issue) allusion is made to the memorable paper read before it by Mr. A. P. Trotter in 1913, which may be said to contain the genesis of the idea of a specification for street lighting. A feature of the discussion was Mr. C. C. Paterson's contribution, summarising the chief features of the British Standard Specification for Street Lighting, which has been drafted by the B.E.S.A. Sub-Committee. Mr. Paterson again presented a summary of the specification at the meeting of the Illuminating Engineering Society at the G.E.C. Research Laboratories on March 8th, when there was a particularly useful and informative discussion. It was undoubtedly a happy idea to present the specification in draft form for comment by the chief societies interested. Opinion seems generally favourable to the specification, which represents the results of two years' patient work, and is framed on lines not dissimilar to those followed in 1913.

The classification of streets is again based on ascending values of minimum horizontal ("mid-span") illumination, from 0.02 up to 2 ft.-candles. It is true that there can, at present, be very few streets in Class A, with a minimum illumination of 2 ft.-candles, and the inclusion of this class seems soewhat optimistic. but if main thoroughfares could be illuminated to the value indicated in Class B (min. 1 foot-candle), this would be a great advance. It was pointed out that at the time of Mr. Trotter's paper the fundamental idea

of grading streets in terms of minimum horizontal illumination was strongly contested in some quarters, but it is probable that the principle will be widely accepted to-day as the best compromise possible. A good feature is the specification of heights of light sources, with a maximum of 30 ft. and a limiting value of 12 for the spacing ratio. The fixing of heights should be helpful in avoiding glare, and in an appendix a method of determining a coefficient, which is an approximate measure of the effect of the glare on the ability of the user of the road to perceive detail, is outlined. This method is based on the reasoning and formulæ set out in Mr. Walsh's recent paper, and is believed to be a novel treatment of the subject of glare. The problem of framing a clause to limit glare in street lighting is obviously difficult: it was suggested in the discussion that the process would appear somewhat involved to the uninitiated, and it was also urged that the fact that the formula only included candle-power and height, apparently taking no account of the degree to which the source was screened by diffusing glassware, seemed anomalous. Other points raised in the discussion dealt with procedure in testing, and a useful communication from Mr. Colquhoun, public lighting engineer in Sheffield, was presented, dealing with the specification from a practical standpoint. There was general recognition of the great value of the work which the British Engineering Standards Association's Sub-Committee had performed, and the difficulty of its task; no doubt the comments made during the I.E.S. discussion will be helpful in enabling it to deal with any points in the Specification which are still not clear and require elucidation.

Standardisation in the United States.

At the winter convention of the American Institute of Electrical Engineers, which was held at New York City last month, the question of simplifying the voltage ratings in vogue occupied a prominent position in the programme, two entire sessions being devoted to a discussion on this subject, which is reported in the *Electrical World* of February 19th. It was stated by representatives of the big manufacturing companies that special electrical apparatus in use in the United States, valued at from 100 to 200 millions sterling, had cost from 20 to 40 millions more than it would have done if standard apparatus could have been used.

The whole range of rated voltages from the generator (13,200 V) and step-up transformer (132,000 V) through four steps down to the ultimate lamp voltage was mapped out and studied. It appears that the three common lamp voltages of 110, 115, and 120 V must be retained, but the tendency is to regard 115 V as the normal, with 230 V between the outers of d.c. three-wire systems. Where a.c. distribution is used, the voltages may be 115 and 199 or 200. Obviously the low lamp voltage entails difficulties with motors and other devices absorbing large powers, and we may congratulate ourselves on having to a great extent escaped that drawback by our bold adoption of the double voltage many years ago; there remains abundance of scope for further unification of our voltages, which is a very pressing need, but the majority of our systems are operating at declared pressures which, at least, are of the right order.

With regard to the generation and transmission voltages, United States engineers are grappling with a huge problem which will also enter on an acute phase in this country when the Central Electricity Board's operations begin to take effect. For instance, the interchange of power which forms so prominent a feature of the Government scheme involves the use of interchangeable step-up and step-down transformers, in order to transfer energy in either direction at pleasure. On the other hand, this calls for a voltage range of 25 per cent., involving heavy expense, whether it be provided by voltage taps or induction regulators, especially as such changes of voltage will have to be made under load. From the report of the discussion in our contemporary, it appears that there is a general feeling in favour of unification of voltages, as would be expected, but considerable diversity of opinion as to the most desirable schedule of voltage ratings and no little perturbation with regard to the cost of changing existing plant. There is in the United States no central authority, such as our Electricity Commission, to deal with such problems, and whilst individual and unrestricted enterprise has been one of the principal factors in the rapid development of electricity in that country, it appears to render the solution of the standardisation problem more difficult of attainment.

Edison's Birthday.

The eightieth birthday of Mr. T. A. Edison was celebrated on February 11th at a luncheon given in his honour in Newark, N.J., by the "Edison Pioneers"; the report in the *Electrical World* states that a message was read from President Coolidge, acknowledging the debt owed by the world to his energy, courage, industry, and strong will, and Mr. Samuel Insull expressed his pride in having served for nearly half a century in a company bearing the name of Edison. There was a large gathering of men who had been associated with the work of Edison before the year 1886, full members of the club, and of associate members—those who were connected with his work between 1885 and 1900. After the luncheon Mr. and Mrs. Edison held a reception at their home, and it is alleged that "Mr. Edison took the whole day off and was late to work next morning."

On February 11th we published a brief appreciation of his career, and telegraphed to him: "London Electrical Review sends most cordial greetings on your eightieth birthday." Last week-end we were gratified to receive from him the following acknowledgment, dated February 23rd, from his laboratory at Orange, New Jersey:—

"Gentlemen,—

"My friends have helped to make my recent birthday a notable and pleasant one. Your message of congratulation and good-will was received and appreciated, and gives me the opportunity to greet and to thank you for your kind remembrance of the occasion.

"Yours sincerely,
"Thos. A. Edison."

Electricity and Gas at Retford.

We have often pointed out that the generation of gas and electricity jointly offered a prospect of effecting material economy in the consumption of coal. In August, 1924, Mr. J. R. Bradshaw, at that time engineer and manager of the Retford Corporation Gas and Water Works, in our "Correspondence" columns expressed the same view, and stated that on his advice his Corporation had taken steps to obtain powers to generate electricity at the gas works, in conjunction with the gas department; and in our issue of April 3rd, 1925, Mr. G. M. Gill, a well-known gas engineer, discussed the question quantitatively, showing that by the use of waste heat, coke breeze, &c., resulting from gas manufacture, a considerable quantity of electricity could be economically produced.

Mr. Bradshaw's proposition has now been carried into effect, and we publish to-day some particulars of the Retford undertaking. In this case the waste heat is used for driving a 50-kilowatt generating set, whilst the larger sets are driven by gas. As the waste-heat set runs almost continuously, on a high plant load factor, it turns out a relatively large amount of "cheap units."

It will be noticed that the larger sets generate at 6,600 volts, a high pressure for a small undertaking; the inference, we take it, is that it is intended to carry the supply into the surrounding country at an early date. Twenty years ago the supply would almost certainly have been direct current—but we have passed that stage.

Retford Electricity Supply.

A small electricity undertaking designed for working in conjunction with a gas works, utilising the waste heat from the retort house, and embodying some novel self-contained transformer units on the distribution system.

WHAT is believed to be the first electricity supply undertaking in this country to work in conjunction with a gas works, utilising the waste heat from the retort house for generating electricity for public supply, with the two concerns under joint management, has been recently established and put on load at Retford, Nottinghamshire, and will be officially inaugurated on March 21st.

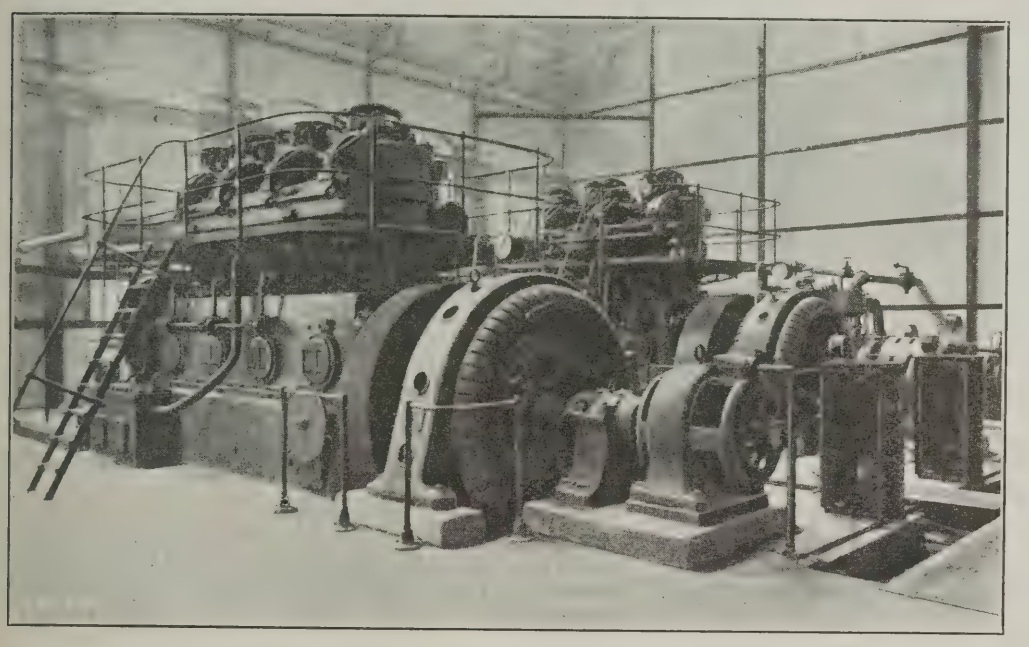

Fig. 1.—Gas-Engine Generating Plant.

A Special Order for the Retford area, 200 sq. miles, was granted to the Corporation last year, and sanction was obtained from the Electricity Commissioners for the construction of a generating station. This has been put down in the gas-works yard. The building is a plain steelwork structure with brick filling and "Asbestolite" roofing.

The main generating plant at present consists of two gas engines, fig. 1, one 4-cylinder, 400 h.p., and the other 3-cylinder, 300 h.p., supplied by the National Gas Engine Co., Ltd., directly coupled to 270- and 200-kW alternators, respectively, 3-phase, 6,600 V, 50 cycles, and the necessary exciters. The alternators were supplied by the Electrical Construction Co., Ltd., the main contractors for the generating plant. The cylinders of the engines are standardised and interchangeable. The machines are supplied with gas direct from the holders. They start on compressed air at 350 lb./sq. in. and are provided with the usual electrical-ignition arrangements. Two compressors, fig. 2, one driven by a small National gas engine and the other electrically driven by a G.E.C. motor, supply the necessary starting air to conveniently arranged bottles. Unusual difficulties were met with when putting down the foundations for the main engines, owing to the existence 10 ft. below the surface of a bed of running sand about 5 ft. 6 in. thick. They were overcome by drilling out 12-in. diameter cores to a depth of 22 ft., and casting piles *in situ*, afterwards placing very heavy concrete beds on the piles and filling in the running-sand space below the beds with liquid or "milk" cement, the latter being pumped into the ground at 300 lb./sq. in. so as to replace the sand. This work was carried out by the Francois Cementation Co., Ltd., and it is said to be the first time that such foundation work has been effected in this country.

The alternators supply direct to a truck-type e.h.p. E.C.C. switchboard, fig. 3, from which the supply is transmitted at the generating pressure.

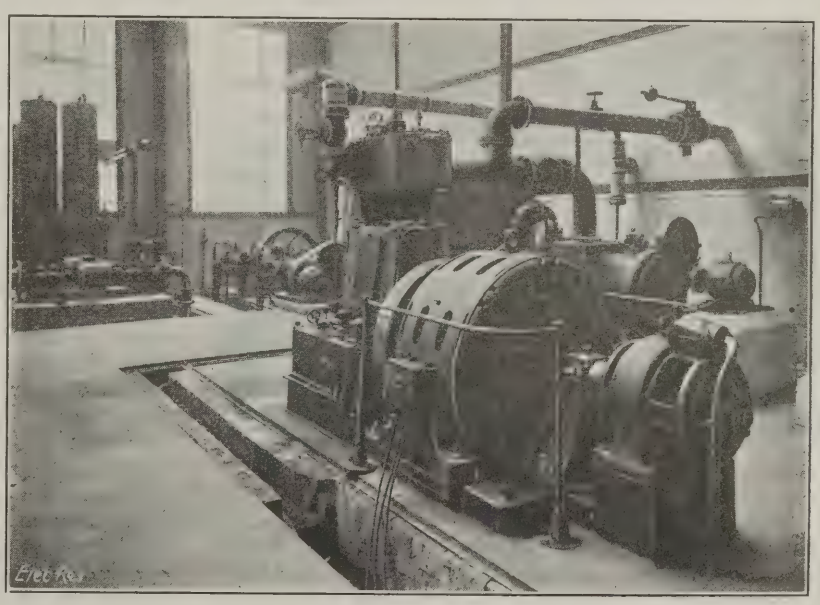

Fig. 2.—Steam Plant and Pumps.

The waste-heat plant consists of a horizontal tubular boiler, supplied by Messrs. Spencer Bonecourt, Ltd., in the retort house, and a small Belliss & Morcom condensing steam engine and auxiliaries, fig. 2, in the

power station. The hot gases are taken from the main flue of the gas plant by means of an electrically driven Sirocco fan and passed through the boiler, and the steam from the boiler is passed through a superheater contained in a chamber near the main flue. The boiler is designed for a working pressure of 120 lb. per sq. in. The feed water is taken from a Spencer Bonecourt vertical waste-heat boiler, fig. 4, which is positioned outside the power house and fed by both the exhaust and the cooling water from the gas engines. This plant also serves effectively as a silencer for the exhaust.

The steam engine is directly coupled to a 50-kW E.C.C. alternator, which generates at 400 V, 3-phase, the pressure of the l.p. supply network. A 2-panel E.C.C. slate switchboard, fig. 3, deals with the l.p. supply from the steam-driven plant. In conjunction with this and a small generating set used in the gas house for supplying power to the stoking machine, a small motor-generator serves as a medium for the interchange of power between the respective works.

The condensate from the steam plant with the cooling water from the gas engines is collected in a hot well, from which it is pumped over a cooling tower, fig. 4, supplied by the Visco Engineering Co., Ltd. From the cooling-tower tank the water is pumped to an overhead storage tank. The make-up water is taken from the town supply. The pumping requirements are dealt with by two double-pump motor-driven sets, fig. 2. In each case the central motor drives two turbine pumps, one for delivery to the cooling tower and one to the storage tank. The pumping equipment was supplied by Messrs. Mather & Platt, Ltd. The engine room is spanned by a 10-ton Morris hand crane.

In connection with the distribution system, some specially designed equipment in the form of distribution units is of particular interest. Each of these comprises all that is necessary for the complete control of a distribution section, taking power from the e.h.p. mains. The principal feature is the cutting out of the usual brick or steel transformer

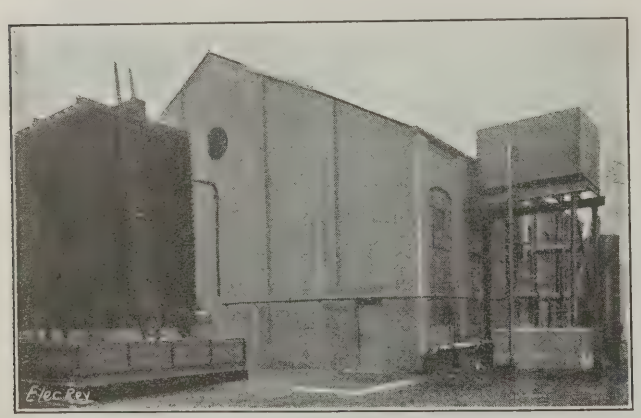

Fig. 4.—Cooling- and Feed-Water Equipment.

chambers, kiosks, and the like, and, by adopting a substantial transformer tank of suitable design, using only one "enclosure," thereby reducing the capital cost considerably, and also the heating losses.

In each case a pillar, containing in its base the necessary e.h.p. trifurcating boxes for both the high- and low-pressure cables, and permanently fixed to the ground, provides for the necessary connections to the unit. The tails from the e.h.p. cables are taken to three well-insulated pockets at the top of the pillar. Similarly with the l.p. cables, but in more recently designed equipment the cable pillar is rather larger, and houses l.p. fuse-link units, thus forming a low-pressure distribution pillar. The l.p. busbars are then connected to four sockets at the top of the corresponding section of the pillar.

The transformer portion of the apparatus is entirely separate from the pillar, and the enclosure is electrically welded throughout. Above the transformer proper, and forming part of the same structure, is a steel chamber accommodating the control apparatus, which is contained in two separate compartments on opposite sides for the division of the two classes of equipment, e.h.p.

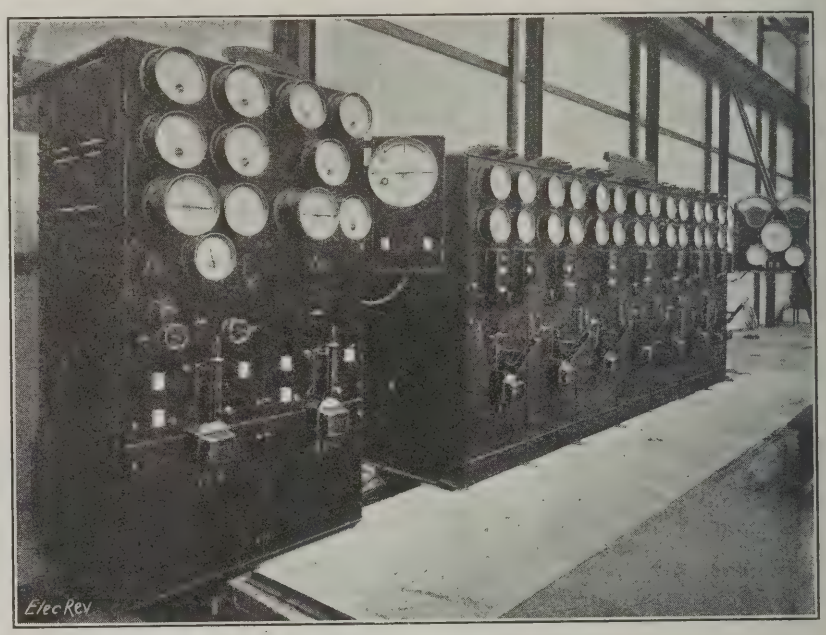

Fig. 3.—E.h.p. and L.p. Switchgear.

and l.p. Separate lock-up doors serve these compartments, the e.h.p. side being further protected by expanded-metal screens suitably interlocked with the switchgear. Corresponding to the sockets provided in the cable pillar, there are connecting plugs on the side of the apparatus chamber, so that there are no cable connections whatever between the two sections, and the transformer, with the control apparatus, can be disconnected very easily from the main. The e.h.p. control gear includes a triple-pole isolating switch in series with three single-pole tetrachloride fuses, one on each phase.

On the l.p. side an ammeter is fitted for each phase and a voltmeter with a three-way switch to give the readings from each phase to neutral. An important feature is the l.p. voltage control. In each phase there are tappings in the l.p. winding connected to regulating switches which can be operated under load; thus the pressure between each phase and neutral can be adjusted independently. Scarcely any flicker can be seen on the voltmeter when these switches are operated. By this arrangement it is possible to deal economically with low load factors, such as are likely to be experienced at Retford, by using small cables even for long runs where the drop at full load would, normally, be too great. The portable portion of the equipment is fitted with roller wheels, and short rails embedded in concrete are provided at the foot of the fixed pillar to facilitate the sliding in or out of position. Suitable flanges at the connection between the fixed and movable parts provide the necessary clamping. In the case of breakdown or other emergency, the transformer can be removed and another wheeled into position, plugged in and made alive, without interfering with the e.h.p. supply, the whole operation being much more quickly performed than changing a transformer in a sub-station.

At present three of these distribution units are installed on the system, two in the town and one in the works, but more will be added as the undertaking is

extended. The works unit is designed so as to be used for either stepping up or down, in order that either the e.h.p. or the l.p. system may be supplied from it.

Fig. 5 shows a 100-kVA distribution unit installed in the Market Place at Retford. The kiosk on the right accommodates three e.h.p. switches, arranged vertically one over the other in separate compartments, with the necessary provision for the lead-in of the cables and the trifurcating boxes, thus providing an e.h.p. distribution point. One of the switches, of course, serves the transformer equipment.

Fig. 6 shows the pillar of one of the more recent designs, which we understand is to be used on the new undertaking which is being carried out at Gainsborough.

The transformer units are interchangeable for any size up to 250 kVA, that is, any size of transformer up to that limit may be served by the same pillar. The contractors responsible for the design and supply of the transformer equipment are Messrs. Foster Engineering Co., Ltd.

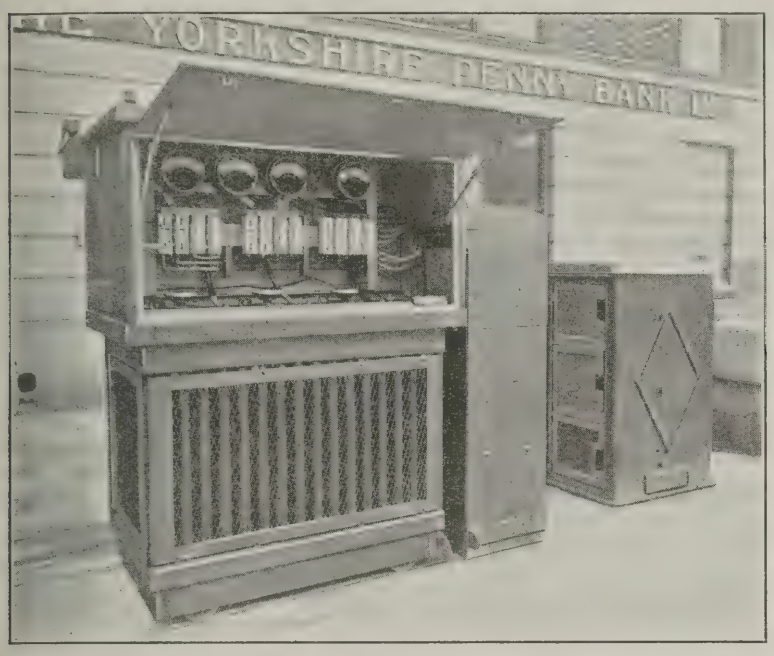

Fig. 5.—100-kVA Distribution Equipment, Retford.

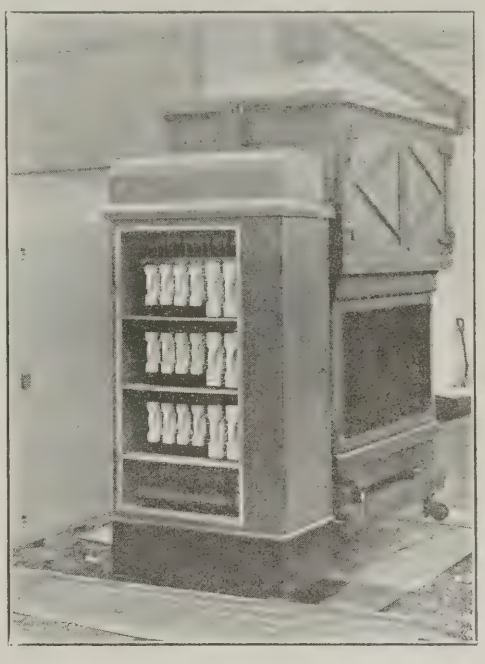

Fig. 6.—Distribution Unit with Pillar Fuses.

The consulting engineers responsible for the whole scheme are Messrs. A. Hugh Seabrook & Partners. Mr. S. O. Pacey, M.I.Mec.E., engineer and manager of the Corporation gas, water and electricity undertakings, supervised a considerable amount of the construction work entailed.

Voice-frequency Telegraphy.

Telegraphy at voice-frequency is a system that promises not only to facilitate operating arrangements, but also to lead to cabling economy; the development of the thermionic-valve repeater has made the method a practical proposition on underground telephone cable networks.

(Communicated.)

THE method of conveying telegraph signals at voice-frequency is sometimes referred to as tone-frequency signalling. It is a development of the method of tuning-fork signalling first tried some 70 years ago, and developed by the French scientist Mercadier towards the close of last century into a multiplex telegraph system having twelve channels of communication, each of which had a Morse key for signalling purposes and a mono-telephone for reception.

The actual signals which passed over the telegraph line came from a number of differently tuned tuning-forks, which were kept vibrating continuously and "making and breaking" connection with a signalling battery at a speed corresponding to their rate of vibration: when a Morse key associated with any particular tuning-fork was held down, the vibrating currents were passed through a transformer on to the line as alternating currents; each tuning-fork was tuned to correspond to the fundamental note of a particular steel diaphragm at the receiving end of the line, each diaphragm being supported on three points and situated above an electro-magnet. The electro-magnets were arranged to receive all the line signals, but the diaphragms responded only to the particular note proper to them; that is to say, to their relative keys at the sending end. Hence, it was practicable to send six different messages at the same time over the line, and for them to be properly sorted out by the mono-telephones. The arrangement proved to be workable, but it had disadvantages that made its adoption at that time quite uneconomical, chief among them being the disturbing noise that it produced on neighbouring telephone lines.

With the advent of the thermionic valve-amplifier, the currents which actuated the mono-telephones could be replaced by much weaker currents and then be augmented at the receiving end to make them suitable for actuating an ordinary telegraph relay, which in turn can actuate printing mechanism. With a valve-oscillator it is much easier to maintain, or to re-adjust,

the rate of vibration required for each channel of the multiplex telegraph line. The rates of oscillation used are kept within the range of the frequency of the human voice, *viz.*, from 300 to 2,000 oscillations a second; the current value on the line is kept to the value approximately of telephone currents, *viz.*, about one milli-ampere; and the voltage at the sending end of the circuit is about one volt. It thus becomes practicable to utilise this system of telegraphy on telephone lines, or cables, and through telephone repeaters. It is this fact that makes the use of voice-frequency telegraphy such an attractive feature at the present time when underground telephone cables containing small-gauge wires are being provided by most Administrations.

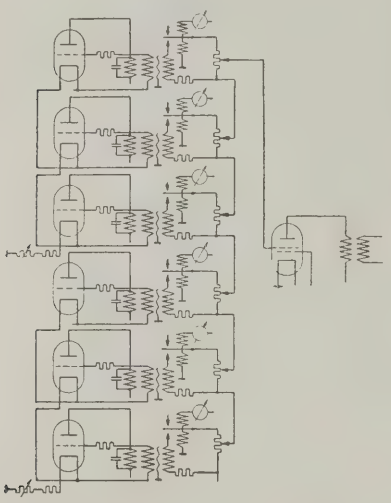

Fig. 1.—Sending Set for Six Frequencies.

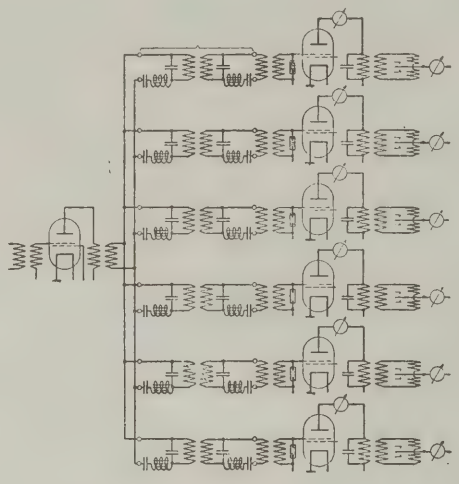

Fig. 2.—Receiving Set for Six Frequencies.

The underground-cable wires for long telegraph circuits of the ordinary type are much larger than those for telephone circuits, being as much as ten times larger in cross section, thus seriously limiting the number of circuits which can be provided in a cable of normal size, and, of course, are very much more costly. The inductive disturbance that may be caused by a modern voice-frequency telegraph system is no more than the cross-talk between ordinary telephone circuits, and is therefore practically negligible from the practical standpoint. The apparatus at telephone repeater stations serves equally well for repeating the voice-frequency signals as for ordinary speech, and there is consequently no need for the attendants at the repeater stations to be telegraphists, or as expert as the staffs at ordinary telegraph repeater stations.

Each frequency can be utilised to work a Wheatstone circuit at 100 words a minute, or a multiplex circuit with four or even more channels. The number of frequencies obtainable depends on the permissible margin between the frequencies, but ten separate channels have been provided and arrangements have been made for even twelve, giving the possibility of 48, or perhaps more, multiplex channels for each pair of telephone wires. Obviously this system can be employed on any circuit that is a practical telephone circuit, and, with some limitations, it can be utilised on circuits which are beyond the limit of commercial speech, by utilising only the lower frequencies.

The voice-frequency method of working is now being developed in Europe and America, and the following detailed information, kindly supplied by Messrs. Siemens & Halske, of Berlin, will indicate the progress that has been made with the system, which has been in daily use on the cables of the German Telephone and Telegraph Administration for several years. Fig. 1 shows the general principle of the arrangement for a sending end providing for six frequencies, *e.g.*, of 400, 638, 877, 1,110, 1,350, and 1,590 periods a second, produced by the valve-oscillators shown. The heating of their filaments is arranged in two sets of three in series, and the frequencies are obtained by adjusting the movable iron cores of the transformers. The amplitude of the frequencies sent out by each of the sending relays is regulated by a potentiometer; the six potentiometers are connected in series and to the grid of the amplifying valve, which passes all signals through a transformer to the line: by this arrangement the opening, or closing, of any of the transmitting relays does not cause any interference with the signals from any of the other transmitting relays. Each frequency produces about 0.2 volt at the sending end of the line, and when all six frequencies are working about one volt is impressed on the sending end. The currents traverse the line and pass through any telephone repeaters that may be necessary on the route in a similar manner to ordinary telephone currents. At the receiving end, fig. 2, the arriving currents pass through a transformer and to the grid of an amplifying valve, thence to six filters connected in parallel, each, of course, being adjusted to receive only the particular frequency corresponding to the particular telegraph communication it is serving. After each filter there is a detector valve which transforms the alternating currents into direct currents. The plate of each valve is connected to a transformer across whose coil is a condenser; thus, when a train of waves arrives at the grid of the valve, a direct current passes through the plate and the primary of the transformer; the secondary coil sends a momentary current through the relay, thus closing the local circuit. On the cessation of the train of waves, the plate-current ceases, causing a momentary reverse current in the secondary coil of the transformer and through the relay, thus opening the local circuit; the

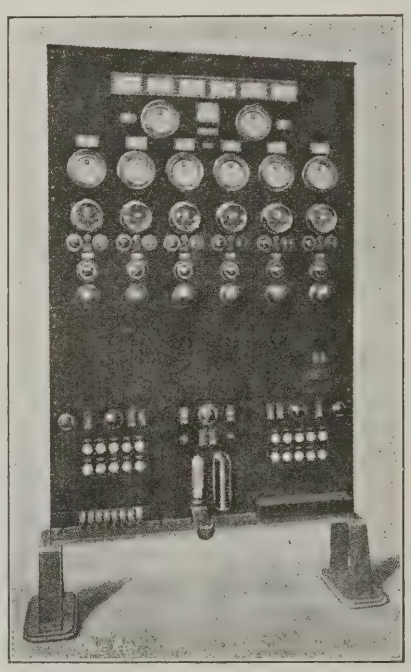

Fig. 3.—Transmitter Board, Six Frequencies.

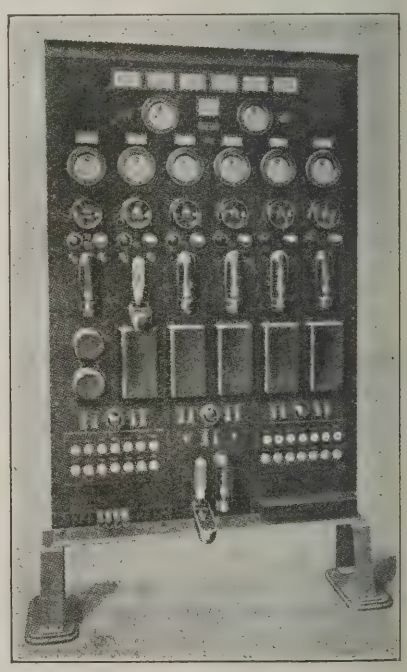

Fig. 4.—Receiver, Six Frequencies.

relay must be adjusted for neutrality, *i.e.*, so that its tongue will remain on either contact when no current is passing through its coils.

The apparatus for the sending end of a six-frequency set is shown in fig. 3: the section is divided into six sets of panels, each set being fitted with similar apparatus and made easily detachable and interchangeable with the others. Each panel of the centre set carries a galvanometer, a relay, an oscillating valve with protecting cover, and arrangements for regulating the frequency and amplitude; also a switch for introducing a suitable resistance in place of the lamp filament when any frequency is out of use; the latter precaution is essential, as the filaments are in two series of three. A control key is provided for actuating the relays when necessary, and a jack for the connection of a telephone for checking the frequencies, or for an amplifying voltmeter for measuring the amplitude of the frequencies. The lower panels are fitted with keys for speaking telephonically with the telegraph office and with the other voice-frequency transmitting station. The latter is usually arranged by superposing a telephone circuit on the two circuits used for the voice-frequency telegraph service. there being one circuit in each direction for a six-frequency service. The amplifying valve which passes all the six frequencies on to the line is situated in the middle of the lowest set of panels and is duplicated, so that should it cease to function, it will be automatically replaced by the reserve valve. On this panel there is also placed an adjustable resistance for regulating the filament current and switches in the filament and plate circuits. Jacks are provided for checking the voltages supplied to the grids by the oscillating valves and the current sent out. The panels to the right and left of the amplifying valve are fitted with fuses for the different circuits, keys for the filament and plate circuits of the oscillating valves, a resistance for the filament circuit, and a reversing key for the measuring instruments. The right-hand key connects the voltmeter at the top of the section to the power leads; the left-hand key connects the ammeter, situated to the right of the voltmeter, in the filament circuits of the oscillating and amplifying valves. In principle this ammeter is also a voltmeter, as it measures the voltage at the terminals of the fixed resistances connected in the filament circuits; it is graduated in amperes. On the upper panel indicators are placed for automatically notifying any faults that may occur; they are in the form of apertures covered by a strip of ground glass behind which are placed small lamps which, when alight, indicate the failure of the voltage for the filament, plate, auxiliary grid, regulating grid, or telegraph. At the same time that the lamp glows, a bell also rings, thus giving both visual and audible signals for attention. Condensers and resistances are placed at the back of the panels for regulating the plate voltage.

The apparatus for the receiving end of a six-frequency set is shown in fig. 4. This section is also divided into six sets of panels similarly fitted with a receiving relay, regulating resistance for the filament current, a measuring instrument to control the current resulting from the reception of a train of waves, two lamp resistances for the relay contacts, detecting valve under a protecting cover, a switch for cutting off the current from the coils of the relay, and a jack for checking the current from the filter by means of a telephone or amplifying voltmeter. Beneath these panels are six other panels supporting the filters for the six frequencies. In the middle of the lower set of panels is placed the receiving amplifying valve and its reserve valve, which comes into operation automatically when necessary, a variable resistance for regulating the filament current of the receiving amplifying valve, three keys for the filament circuits and three keys for the plate circuits, as well as a jack for the control of the unamplified current. The spaces to the right and left are occupied, as on the sending section, with fuses, keys, and switches. The upper panel carries galvanometers for checking the outgoing currents to the Telegraph Offices, as well as the apparatus for verifying the power supply, and the fault indicators. The transformers, both ingoing and outgoing, of the receiving amplifying valve, and the detector transformers are placed at the back of the panel, as well as the regulating resistances and condensers of the power supply circuit.

The speed of signalling on the voice-frequency system is limited by the fact that the frequency band of the receiving filters is limited in width, which is a simple function of the duration of the transitory period of an alternating telegraph signal. Let us suppose that we can accept a duration of the transitory phenomenon equal to t seconds, then the narrowest band of transmission allowable will be given by the equation $\delta f = (0.8 \text{ to } 0.88)\ l/t$; but for greater security in practice we take $\delta f = 1.2\ l/t$. The filters in the system described have a transmission band of 80 periods, the transitory period being 0.015 second. A satisfactory service is possible when the transitory phenomenon is less than the duration of the minimum signal, known in the Morse code as a "dot." One can therefore send 67 dots (or dot spaces) a second, or 4,000 a minute, or 800 letters of the 5-unit code.

In practice it has been shown that on long-distance cables the transitory phenomenon has not prejudiced the security of service on lines exceeding a length of 1,000 kilometres. The transitory period of a signal is defined by the difference of the duration of propagation of the highest and lowest frequencies employed for the transmission of a signal. The band of frequency transmitted has a width of 80 periods. The difference of the duration of propagation is the highest for the band corresponding to the highest carrier frequency. This band is between about 1,600 and 1,680 periods. The duration of propagation of these frequencies on a conductor 0.9 millimetre in diameter and 1,000 kilometres long, is from 0.074 to 0.0763 second, giving a difference of 0.0023 second. As the receiving filters introduce a transitory period of 0.015 second, it is essential that the line should have not more than 0.005 second. This will be reached only by cables having a length of $(0.005 \times 1{,}000/0.0023) = 2{,}200$ km., about.

Static and Hurricanes.

Static, the bane of the radio fan, may prove a valuable warning of storms and hurricanes, according to a study made by the Hydrographic Office of the U.S. Navy. In a study of the value of weather maps in navigation, it was noticed that there was a very definite relation between the state of the atmosphere, as recorded in the data for weather maps broadcast from the naval radio station at Arlington, and static. Later, when the weather maps were broadcast and received by means of the machine invented by Mr. C. Francis Jenkins, wherewith a duplicate of the transmitted map is automatically drawn on the ship, it was found that the receiver could be used to record static. The Jenkins machine is used in connection with a radio compass: the latter is equipped with a loop antenna so that as the loop is rotated, and peals of static in any direction are detected by the receiver, corresponding ink lines are drawn on the paper-covered revolving drum of the Jenkins machine. In the time that it takes the recording pen to travel from one end of the drum to the other, the loop is turned through a complete circle, so that the paper gives a graphic picture of the static in any direction. Such hurricanes as the Miami one develop off Cape Verde several weeks before they hit the United States. It is suggested that a group of radio compass stations would be able to detect these storms as they approach. With three stations, where the lines cross would be the centre of the storm, so that its position could be accurately plotted and sufficient time for warnings and preparation could be allowed.—*Science Service.*

The "All-Earthed" House.

Some Suggestions for the Prevention of Shock from Domestic Electrical Appliances.

By H. W. CLOTHIER, M.I.E.E.

IT seems to me that some of the points in Mr. R. H. Rawll's interesting article on the earthing of portable domestic appliances in your issue of February 11th are so vital that they should be emphasised by further comment. One of the most important things that he says is that plugs and sockets with earthing arrangements embodied in them should be provided at every power point, and I agree very heartily with this as a principle. My own view of the best method of providing for earthing, however, is different from Mr. Rawll's: he advocates the use of three-pin plug sockets, and I find it better to have a metal-enclosed plug in which the outer case is used to make a scraping contact. My objection to the pin for earthing is that it may be damaged, and may therefore cease to make proper contact; in all my experience, on the other hand, I have never known a scraping contact to become unreliable.

In my own opinion, every piece of portable apparatus should be provided with a standard socket as an "inlet" for the current, from which the plug with its flexible cable may be detached. The plug at the other end of the flexible cable is, of course, also detachable from the socket on the wall. It may be called the "outlet," and thus the flexible cable, with the "outlet" plug at one end and the "inlet" plug at the other end, will be standard throughout the house, and may be used conveniently at any power point. Corresponding to the words "inlet" and "outlet" for the two ends, the word "trailet" has been applied by my company to the complete part consisting of the flexible cable and the two end fittings.

One of three possible conditions may obtain when the live conductor touches the frame of the apparatus. The frame may be properly earthed, the earth connection may be faulty, or the frame may not be earthed at all. The effect on a person who happens to be touching some other piece of earthed material will be different under each of these three conditions. In the first case, he may handle the frame of the electrical apparatus with perfect safety and no fear of discomfort; in the second, he will receive a shock, which will be more or less severe according to the amount of resistance in the earth connection; and in the third, he will receive a shock at the full voltage to earth of the supply system. A fatality occurring in domestic service is obviously a very serious matter, and, apart from that, it is also of the greatest importance to avoid all possibility of the frequent occurrence of even minor shocks. This is becoming more and more a subject for close attention, because the extent to which electricity will be used in the future is so much greater than it is now. If the present practice of not having effective earthing everywhere continues, it is certain that many more accidents will happen, and that there may even be fatalities; and it does not seem to me that this serious difficulty can be met by merely prohibiting the use of wall plugs in certain places. This would restrict the use of electricity quite unnecessarily. As Mr. Rawll points out, the things in a house that are earthed are not found only in bathrooms or sculleries; there may be, to name a few, kitcheners, used or disused gas pipes, cistern chains for flushing, wash-basin taps in cloak rooms and nowadays frequently in bedrooms, water radiators and pipes for central heating systems, bell wires, wires for connecting up wireless apparatus, and telephone earth wires. Modern buildings, too, have a great deal of steel work in their construction; one might go so far as to call some houses "metal-clad" as a whole. The network from which the domestic supply is taken is usually earthed on one pole outside the house; and when conductors connected to that pole happen to be in metallic contact with the framework, the latter will necessarily be at earth potential, and it is thus quite impossible to ensure that there will be no "earth," even in a room where the presence of earthed materials might not be suspected. I think we must also face the fact that the voltage may be as high as 260, and that this makes the problem more difficult in this country than in those where something in the neighbourhood of 100 V is used.

The bathroom is only different from other rooms because a person having a bath is likely to be in better contact with earth than in any other part of the house. A case is on record of a girl being electrocuted in a bath when using a hair dryer or vibrator; and it is at least conceivable that a person elsewhere who happened to be handling a piece of electrical apparatus—for example, a kettle with a faulty connection—might, if standing near a central-heating radiator, which would necessarily be earthed, put out a hand and touch the radiator, and thus run almost as great a risk in the drawing- or dining-room as in the bathroom. It seems to me that the obvious remedy is to adopt the practice employed in collieries and factories, that is, to earth the framework of all apparatus everywhere. In other words, it ought to be as unthinkable to have electrical apparatus with its framework unearthed in the house as it is now in industrial places. It may be argued that to provide for this would involve the introduction of a number of new regulations, but surely these regulations would be well warranted if absolute security were obtainable by working to them.

If universal earthing is adopted, the first thing to secure is continuity of the earthing system. This has been recognised already in other connections; for example, so long as 30 years ago concentric single-phase systems with earthed outers had only links, without switches or fuses, on the earthed side, and the prohibition by the I.E.E. Regulations of fuses or unlinked single-pole switches on the earthed side of an installation is well known. It has been argued in a discussion following a fatal accident due to a shock from a lamp-post, that there should be no fuses on the earthed side of any sub-circuit. In a discussion at one of the power conferences in Paris, an American engineer stated that the question of earthing had been considered in the United States, and that a proposal had been made to use a concentric system in which the outer was earthed and connected to the framework of the apparatus. At present, I believe, serious shocks are frequent in the States, notwithstanding the lower voltage commonly used there. There are a large number of washing machines, often in damp basements, and the earth connections of these are frequently much neglected or of poor quality. A bad earth connection is worse

than none at all, because it gives a false sense of security. In addition to this, two metallic parts of the earth circuit exposed in a house might have a difference of potential between them sufficient to cause arcing and possibly even a fire; and obviously a shock could be felt by a person touching both of these points, even though he was quite remote from the electrical apparatus. Effective bonding of the metal work in the earth circuit is therefore essential, and the best way of securing it is to use a bare copper wire leading from the sockets of the wall plugs to the nearest good "earth," such as a cold water pipe, and to clamp it to any cable cleating or other metal work that it may pass in its course. If the earth circuit is reasonably well made at the beginning, there is little fear that an open circuit will develop in it. A simple way of checking its continuity is to use the earthing conductor as a common return for the ordinary electric bell system of the house, coupling one terminal of the remote bell pushes to the end of the earth wire, and the corresponding pole of the battery to the nearest part of the cold water system. An accidental break in the earth wire would then be detected by the failure of the bell to ring, and, this indication having been given, the break could readily be found because the earth wire is on the surface and the connection to the water pipes is visible.

It is obviously essential for securing continuity in the earthing circuit that the connection between the earth wire in the flexible and the apparatus "inlets" and wall "outlets" should be thoroughly dependable. This can be achieved with certainty by the use of the protected plugs and sockets already referred to, in which a tongue in the socket or, alternatively, the entire circumference of the socket, makes a scraping contact all round the casing of the plug. Nothing short of deliberate intention, and the use of some special tool, could so distort this contact as to prevent it from making a proper connection. The earthing contact of the flexible is visible where it is connected to the terminals of the plugs at both ends, and, being locked by a spring washer, it cannot work loose unless it is purposely interfered with. One great advantage of this type is that a sound and permanent earth connection can be made by a wireman of ordinary skill. Another very important point is the making of a good earth connection between the protecting shield of the "inlet" socket on the apparatus and the framework of the apparatus. Sometimes a protrusion formed in the metal of the framework can be used, or the earth connection may simply be soldered or welded to the framework. Where this method is used, or a connection is made by bolts or screws, a thoroughly satisfactory job can be made of it at the maker's works, and the apparatus will be sent out in permanently sound condition.

The shrouded type of plug has the very important advantage that it can be used as a circuit breaker, because the arc, when the circuit is broken, is enclosed in a metal chamber. This being so, very considerable saving can be effected by using plug "outlets" without switches in house installations, or, alternatively, more plug "outlets" can be put in for the same total expenditure. It has been argued that if switches are not used, a meddlesome child may poke something into the socket. A switch at the door is, however, no protection in such a case. It would need to be near the socket, and interlocked with it; and it would certainly have to be a double-pole switch, not a single-pole switch like so many of those on the market, which give the impression of security without the reality, because there may still be a live pole although the switch is off. Even when a double-pole interlocked switch is used, the interlock must be essentially of good mechanism and such that it will not fail during the lifetime of the plug; it must clearly be close enough to prevent the plug from being partly pulled out so as to expose the pins when the switch is on. These requirements make the apparatus very costly if switches are included, and it is obvious that it is far from being as simple as when plugs and sockets are used of such sound construction that switches can be altogether dispensed with. The socket fitting can be recessed deeply into the insulation and the holes made so small that even the tiniest child would have difficulty in poking its fingers into the recess, and safety can thus be secured at least as certainly as with switches. A further useful precaution against danger to children crawling on the floor is to put the sockets out of their reach by fixing them two or three feet above the floor level, which gives a real advantage by actually making them more accessible in ordinary use.

I urge most strongly, finally, that it is right and proper to make our homes as free from discomfort and the possibility of danger as we make our factories, and I submit that this can be done in the way I have suggested without depriving ourselves of the use of electric portable appliances in any part of the house where we may wish to have them.

The Charges for Packages.

Returnable and Non-returnable Crates and Cases.

By W. ERIC JACKSON, LL.B., Barrister-at-Law.

THE question of packing charges is one which arises from time to time in every trade, very often leading to bad feeling, and more often than not to useless debits and credits being made. Strangely enough, there have been no authoritative legal decisions upon the question whether a seller can charge a buyer with the price of cases or crates, probably because most large sales of goods are in bulk, and in small sales the packing charges are negligible.

It seems to be a general principle of commercial practice which is recognised by the laws of France and of the United States, that all expenses prior to delivery are to be borne by the seller. This, of course, would include packing charges.

In this country, however, the expenses of delivery are generally borne by the buyer, subject, of course, to any contrary arrangement. The Sale of Goods Act provides that the question whether the seller must send the goods or whether the buyer must come and take them depends on the terms of the contract. If nothing is said, the place of delivery is the seller's premises; that is, the buyer must come and fetch the goods.

The Act, however, also says that "Unless otherwise agreed, the expenses of and incidental to putting the goods into a deliverable state must be borne by the seller." Hence, if the place of delivery is the seller's premises, the packing charges will be negligible in most cases. The goods need only be sufficiently packed so as to be handled by the buyer's carman.

If the goods are sold f.o.r. at the town where the

seller's business is, the goods must be packed sufficiently to enable them to go by rail. In this connection two decisions of the Courts are of interest. It has been held that where there was a sale of a cargo of rice "from the deck," the seller must pay all that is reasonably necessary for the buyer to remove the goods. Thus, harbour and dock dues were payable by the seller. And where wool was sold by weight, the seller was held liable to pay the cost of labour in putting the wool into the buyer's sacks.

If goods are sold on the terms that the seller is to send them per post or rail, the delivery is not complete until the goods have arrived. That is, the buyer will not be bound to pay for the goods if they arrive damaged or get lost in transit. Accordingly, the expense incidental to delivering them at the buyer's premises will fall on the seller. The fact that the buyer pays carriage charges sometimes confuses matters, and it might be argued that delivery in those instances is complete as soon as the goods are put on rail, the seller acting as agent for the buyer. But the trade practice is more often than not to the contrary, and if goods are lost in transit the loss is generally borne by the seller, who claims on the carrier. The fact, then, that carriage charges are borne by the buyer does not seem to alter the general presumption that in such contracts delivery is the buyer's premises.

Accordingly, packing material sufficient to protect the goods in transit is the seller's liability. This does not mean that he sells the package to the buyer. The sale is for goods, the package is only an incident in delivery. If the seller chooses to deliver by his own van, he need not pack the goods at all. The packing material is only the seller's means of making delivery, and the buyer cannot claim to keep it if the seller indicates his wish to have it back.

Accordingly, any statement on the invoice that the case is returnable, or any charge made for it, will be sufficient to tell the buyer that he must not keep the empty case. If he does, he will be liable to pay a reasonable price for it. What is a reasonable price depends on the circumstances, but generally the Court will accept the invoice price. If a buyer sees the charge made for a case and chooses to keep it, he will be deemed to have accepted the price charged. Where a case is returned, the seller must, of course, bear the carriage for its return.

A habit is creeping into existence in some trades of charging for packing material and stating that the package is not returnable. This, of course, leaves the buyer open to any number of abuses. The seller could charge top prices for cases and crates without the buyer being able to object. Such a state of affairs is unwarranted at law unless there has been some agreement between the parties previous to the sale. To send goods and state on the invoice, "Charge for case, so much; case not returnable," is not enough to render the buyer liable. By the time the invoice arrives, the goods may have been dispatched, and the buyer cannot but receive them. The invoice in such a case cannot be considered as an agreement.

But where the seller's quotation or price list states that cases will be charged for and will be non-returnable, the buyer will have to bear the cost of packing; for in ordering goods it will be assumed that he orders them on the terms stated in the price list.

But the seller will not be able to charge any price he likes. Suppliers cannot foist on to buyers old cases and make excessive profits out of them. The Sale of Goods Act distinctly says that where no price is agreed, the buyer must pay a reasonable price.

Shortly stated, the law seems to be, where the parties agree previous to the sale, that the buyer shall pay for packages, the seller may charge him a reasonable or an agreed price. Where there is no agreement to pay for packages, the seller must pay for them unless the place of delivery is the seller's place of business. The seller may make an invoice charge for returnable cases, and if the buyer keeps the case he must pay this charge. Otherwise he may return it at the seller's expense and be credited in full with the invoice charge.

A very recent case in Ireland confirms this view. In that case a firm of mineral water manufacturers sold their goods in bottles branded with their name. The course of dealing with customers was to invoice the bottles at a deposit rate of 2s. per dozen, and when bottles were returned they were credited in full. Where bottles were not returned the customers were debited. A dealer in mineral water ordered a hundred dozen bottles, and when 48 dozen of them were empty claimed to keep them at the price charged, namely, 2s. per dozen. This price was, in fact, only a bookkeeping charge, the bottles being much more expensive. The Court held that the dealer was not entitled to retain the bottles. The sale was a sale of mineral water, not of bottles, and the bottles throughout remained the seller's property. The buyer is only entitled to keep the bottles at the seller's agreed price, 2s. not being a reasonable or agreed price. This case contained circumstances which arose out of the course of dealing. In the ordinary way, if a seller makes a charge for a package, it will be assumed that that is the value he places on it; and the buyer can keep the package on payment of the price invoiced. In the Irish case it was stated on the invoice that the bottles could not be purchased, but remained the seller's. The case shows, however, that a sale of goods does not necessarily include a sale of the package, and that neither seller nor buyer can force the other against his will to buy or sell the packing material.

Legal.

British Thomson-Houston Co., Ltd., v. Mullard Radio Valve Co., Ltd.

Mr. Justice Tomlin, in the Chancery Division, on March 11th, had before him the motion by the British Thomson-Houston Co., Ltd., against the Mullard Radio Valve Co., Ltd., which had been adjourned from a fortnight ago. Mr. Whitehead, K.C., for the plaintiff company, said that the motion was for an injunction restraining alleged infringement of a patent. On the last occasion he mentioned that a settlement might be reached, and he was glad to say that the parties had actually come to terms which would involve the discontinuance of the action. He had advised his clients that the best course would be to take no order on the motion except that the costs would be costs in the action.

Mr. R. Moritz, K.C., for the defendant company, assented, and his Lordship made an order accordingly.

British Thomson-Houston Co., Ltd., v. Metropolitan-Vickers Electrical Co., Ltd.

In consequence of the indisposition of Lord Dunedin the further hearing in the House of Lords of this action could not be proceeded with on March 14th, and had to be postponed.

Triumph Trust, Ltd., v. Smith.

In the Mayor's and City of London Court, before Mr. Registrar Dell, on March 8th, a claim was made by the Triumph Trust, Ltd., Old Broad Street, E.C., against Mr. F. Smith, Keighley, electrical engineer, for £9 balance of payment for a radio set. The Registrar said that the defendant had sent a letter to the Court pleading fraud and misrepresentation. He stated that he had returned the set because of faulty equipment. The plaintiffs' solicitor said that the set had not yet been received by the plaintiffs. The defendant, in addition to his agreement with the plaintiffs to hire the set from them, was to get a commission of £1 if he got other people to take similar sets. A witness said that it was not true that the plaintiffs agreed to employ the defendant as sole agent in his neighbourhood. The Registrar said he was satisfied that the plaintiffs were entitled to recover. The plaintiffs' representative said the claim of £9 was for balance of hire; the value of the wireless equipment was £13, but the defendant, upon payment of the balance of the amount, would be entitled to it. Judgment was given for the plaintiffs for the amount claimed.

New Electrical Devices, Fittings and Plant.

Readers are invited to submit particulars of new or improved devices and apparatus for publication in this Section.

A New Earthing Clip.

The accompanying illustration, fig. 1, shows a clip which has been introduced by Mr. G. Turnock, 41, High Street, Aston, Birmingham, to facilitate earthing connections on pipes and conduits. It is of the usual pull-up design, with clamping lugs served by a bolt and nut. The bottom portion of the clip is slotted and grooved internally. The earth wire is threaded through the slots, so that when the clip is tightened up the wire is pressed hard against the pipe. By means of the stamped-out portion for the internal groove, the contact is well protected. It is claimed that the grip obtainable is sufficient to carry the weight of an average man.

Improved Control Pillars.

An example of the range of control pillars developed by Messrs. Mavor & Coulson, Ltd., 47, Broad Street, Mile End, Glasgow, S.E., is shown in figs. 2 and 3. The apparatus is particularly suitable for use in connection with underground haulages in collieries, several of which have standardised on the equipment for all their haulages. These pillars, which have recently been improved in several respects, can be supplied for controlling motors up to 120 h.p. at from 440 to 660 V. The distinctive feature of construction is, of course, the assembly of all the control gear for the motor in a single housing, thus eliminating the expense incurred in the supplying and fixing of interconnecting pipes and cables between independent pieces of equipment. The removal of the control pillar for periodical overhaul or repair is also a simple matter, and a spare pillar can be set down and connected up in a minimum of time.

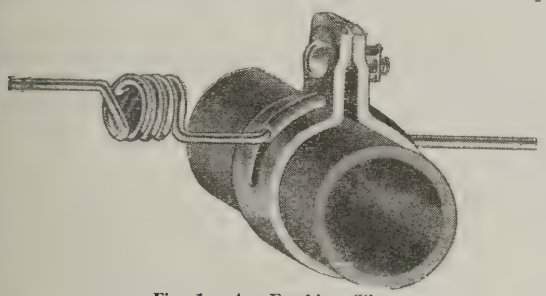

Fig. 1.—An Earthing Clip.

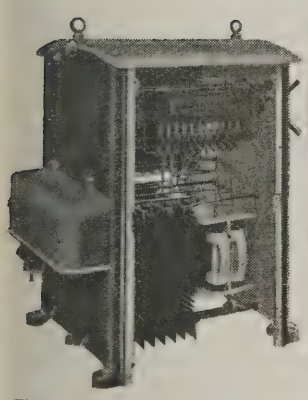

Fig. 2.—Electric Control Pillar, Interior.

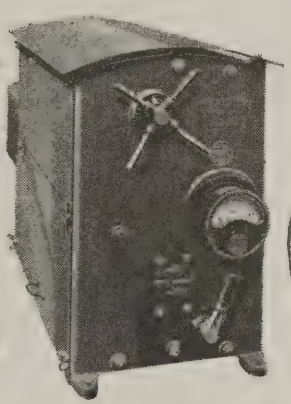

Fig. 3.—Control Pillar, Exterior.

For use with d.c. motors the makers' standard quick-break knife switch with an external operating handle is fitted, whilst for a.c. slip-ring motors a free-handle type of oil circuit breaker is supplied. Standard shielded-pattern fuses are employed for the d.c. equipment. The resistance is rigid, rustproof and unbreakable, the grids being pressed from a special resistance material, and adequately supported by mica insulation. Unless otherwise ordered, the resistances are supplied with a standard grid rating of two minutes over the first portion and continuously over the second portion for the smaller equipment, while for the larger pillars the grids are one minute, two minutes and continuously rated. The controller is liberally designed, the barrel contacts being of ¼-in. h.d. copper for all except the smallest size, in which 3/16-in. contacts are used for motors up to 20 h.p. A terminal box to take the incoming cable and motor leads is one of the improvements on the original design. A special operating gear having an "off" position catch to prevent the controller from being inadvertently carried through to the reverse position before the motor has stopped is supplied. Automatic air-break d.c. circuit breakers can also be fitted in place of switches and fuses for d.c. control pillars if required.

A New Street-Lighting Fitting.

The "White-Way" street-lighting fitting, fig. 6, is an example taken from a wide range of fittings specially designed for suburban use which has been introduced by the Engineering & Lighting Equipment Co., Ltd., Sphere Works, St. Albans, Herts. They are suitable for one 500-W lamp in the inverted position or for two lamps of 150, 200, or 300-W capacity in the ordinary position. The globe ring consists of a casting with a draining channel, and is provided with holes for accommodating the 5/16-in. brass screws by which a spun-copper retaining ring secures the globe at its neck. A centre supporting tube carries a small distribution box from which the lamp holders are suspended, and, by passing on to the canopy relieves the globe of all strain, it is claimed, due to high winds. The glassware is of the makers' "Lunax" quality, for which a lighting efficiency of 85 per cent. is claimed.

Two Special Automobile Lamps.

The leading lamp manufacturers have for some time past been experimenting to produce an automobile lamp which will eliminate glare and dazzle completely and avoid the necessity for dimming, dipping, or blacking-out, and it is interesting to learn that Messrs. Philips Lamps, Ltd., 145, Charing Cross Road, W.C.2, have now placed on the market the "Duplo" lamp, fig. 4, by which, it is claimed, the object is efficiently achieved. This headlamp is gasfilled and provided with two filaments of equal lighting power; one furnishes a powerful light for normal use, and the second is fitted inside a metal cup which throws the rays toward the upper part of the reflector, whence they are reflected on to the road, thereby avoiding glare. As both filaments are of equal c.p., no reduction of light results from switching over from one to the other. The non-dazzling beam is also claimed to be of great assistance when driving in foggy weather. The lamp can be supplied for 6 to 7 V, 18 W (per filament), and 12 to 14 V, 36 W. Fig. 5 shows a twin-filament automobile headlamp which has been introduced by the British Thomson-Houston Co., Ltd., Rugby. This is also provided with two filaments of exactly the same wattage, one of which is situated at the focal point of the reflector, whilst the other is above this position. By means of a change-over switch the filament at the focal point is extinguished and the other lighted, giving the effect of a dipper. This lamp is provided with a corrugated glass bulb, which, it is claimed, eliminates all internal reflections, thereby reducing to a minimum all glare and dazzle. The Mazda lamp is supplied for working on 6-7 V, each filament having a loading of 18 W, and it is made with either English or American caps.

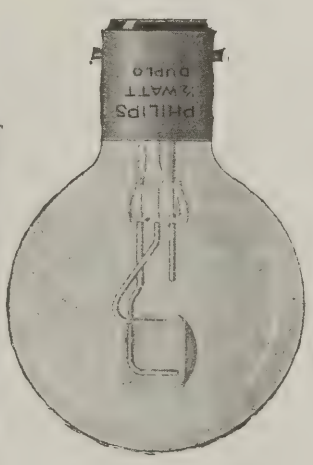

Fig. 4.—The "Duplo" Lamp.

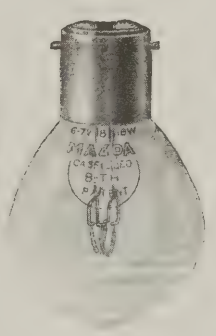

Fig. 5.—"Mazda" Anti-dazzle Lamp.

Fig. 6.—"White-Way" Fitting.

Electrical Progress in New Zealand.

The Trade Commissioner's Report.

MR. L. B. BEALE, Trade Commissioner in the Dominion of New Zealand, has forwarded to the Department of Overseas Trade a report upon the economic and commercial conditions in the Dominion during 1924, 1925, and the first seven months of 1926.

After a period of prosperity, New Zealand received a slight check during 1924-25 and the succeeding year owing to unfavourable weather conditions which affected farming, and to a decline in wool prices. As a consequence, in the twelve months ended June, 1926, imports exceeded exports by about £6,000,000, whereas in the preceding year there was a balance of £6,500,000 in the opposite direction. The general economic position is, however, thoroughly sound, and any favourable movement of price levels will not only maintain but enhance the prosperity of the Dominion. The State finances are said to be in capable hands. During 1925-26, £7,180,479 was spent on public works, &c., of which £4,700,000 was expended on railways, telegraphs and telephones, and hydro-electric power schemes.

Industry and Trade.

Factory production in the Dominion is stated to be steadily growing. The total value of products increased from £76,996,397 in the year ended March 31st, 1924, to £84,101,313 in 1924-25. This figure includes the value of the output of many industries closely associated with primary production as well as those devoted to heat, light and power. Electricity generation and supply is credited with a value of £1,668,743, as compared with £1,430,951 in 1923-24. The value of engineering products is given as £1,846,218, as against £1,644,224 in 1923-24.

The total value of imports during 1925 was £52,456,407; with the exception of the "boom" year of 1923, when the figure reached £61,595,828, this is the highest recorded. New Zealand's imports of electrical goods and apparatus are not mentioned separately in the report, but we are told that Germany's share of this class of trade was £18,385 in 1925, as compared with £12,069 in 1924 and only £878 in 1923.

Hydro-Electric Development.

It is stated that £5,134,496 had been expended on hydro-electric works up to the date of the report, and the Minister for Public Works announced recently that the developments in view called for the expenditure of at least £1,000,000 a year for the next four years, after which there would be a reduction, but not a cessation, of constructional activities. The capital expenditure upon the Mangahao scheme was over £2,000,000 at the date of the report. Wellington City Corporation and a number of power boards were supplied from this source during the year, and the load on the plant has developed very rapidly, the peak load rising to 18,100 kW, very nearly the full capacity of the station (19,200 kW). The load factor is said to be good. In view of the demand, arrangements have been made to expedite the execution of the main Waikaremoana scheme. It is hoped to have two 20,000-kVA sets in operation there by June, 1929. The largest scheme—that at Arapuni—(96,000 h.p.) is progressing. The work, which is in the hands of Sir W. G. Armstrong, Whitworth & Co., Ltd., was originally intended to be completed in August next, and it is not expected that the time will be greatly exceeded. The duplication works intended to raise the capacity of the Lake Coleridge plant from 16,000 to 36,000 h.p. are nearing completion. The first of the new 7,500-kW sets was put into operation in July last and the second was well advanced. The finishing of these four schemes completes the Government's present programme, and the supply will be sufficient for some time. In the South Island, however, where the power is more limited, further investigations are being made with a view to the development of likely hydro-electric resources. The Government has adhered to its promise to use only British plant wherever possible, and only a small proportion of the requirements has been purchased from foreign countries. In January last year a licence was granted to a local group for the development of 50,000 h.p. in the vicinity of Deep Cove, Doubtful Inlet, for electrochemical purposes, as well as a further 250,000 h.p. from Lake Manapouri. The total cost of the whole scheme is estimated at £5,000,000. The first stage of the Lake Monowai scheme of the Southland Electric Power Board was completed and the power switched on on May 1st, 1925. The present capacity is 4,000 kW, and is to be extended to 12,000 kW.

Telephones, Telegraphs and Broadcasting.

The Post and Telegraph Department reported record business during 1925-26, and a satisfactory balance was earned. The rapid increase in the use of the telephone is striking; the number of subscribers' and other stations has doubled since 1917, the total now standing at 130,186 (94.4 per 1,000 of population). Some 30 per cent. of the subscribers are now provided for by automatic exchanges. The system was put into operation in Auckland in 1925, and later in the year the remaining manual exchanges were converted in Wellington. Christchurch is now partially equipped, and Dunedin will soon be totally automatic. In March last a telephone cable was laid between the North and South Islands. During the past two years capital expenditure upon telephones and telegraphs has approximated £1,000,000 per annum, and an extensive programme is in prospect.

Interest in radio-broadcasting was limited until, in August, 1925, the Post and Telegraph Department entered into an agreement with a company which undertook to provide an efficient service for five years. The company took over the existing services and opened a new 500-W station at Auckland. Similar stations were to be erected at Christchurch, Wellington, and Dunedin. At the date of the report the number of receiving licences issued was 5,000, but there were signs of an improvement; the number of dealers' licences doubled during the last year covered by the report.

Railway Electrification.

In August, 1925, two well-known London consulting engineers submitted to the Government a report dealing with the proposed electrification of the suburban sections of the railways in the vicinity of the four main centres. Its chief immediate interest lay in its suggestion that electrification of the existing Christchurch-Lyttleton line might meet present difficulties in a more satisfactory manner and at a lower cost than the construction of the projected new double-line tunnel. After consultation with local interests, a detailed scheme of electrification has been drawn up, and is at present under the consideration of the Government, with, it seems, good prospects of adoption.

Preference for British Goods.

On April 1st, 1926, new regulations were brought into force which limited in general the application of the British preferential tariff rates to goods of the works cost of which half at least consists of British Empire material or labour or both, and which have undergone the final process of manufacture within the Empire. Goods not included within this heading nevertheless enjoy the benefits of preference if all processes of manufacture have been performed within the Empire from unmanufactured raw materials, or from certain specified partly manufactured raw materials. Broadly speaking, the effect of the new regulation has been to raise from 25 per cent. to 50 per cent. the proportion of British labour or material, or both, necessary to qualify for preference. The object in view has been to prevent manufactures of foreign origin qualifying by reason of final processes of finishing off or assembly carried out within the Empire, and thus to encourage the importation of goods thoroughly British in character. Whilst to a considerable extent this aim appears to have been achieved, the result has been in certain lines to divert a proportion of the trade to foreign sources of supply.

American Activity in Brazil.

The semi-official *Industrie und Handels Zeitung*, of Berlin, in announcing the sale to the General Electric Company by the "Cia. Brasileira de Energia Elettrica" of its power stations in the States of Rio de Janeiro and Bahia, expresses regret that by this sale the prospect of German industry participating in the contract for the extension of the Bananeiras power station has diminished. The purchase price is said to be 72,000 contôs (say £1,800,000) for the Rio de Janeiro works and 22,000 contôs (say £550,000) for those in Bahia. The transfer was to take place in about two months, the working staff to be retained, but the supervisors to be replaced by Americans. The Rio newspapers attributed this acquisition by the Americans to the desire to obtain control of fresh outlets for their products. It is recalled that the General Electric Co. has already bought the Cia. de Tramways, Luz e Forca, of Victoria, as well as the Expresa Paulista de Electricidade, of Pauru, and that it is also in negotiation with the Orion Company, of Parretos, which owns the Mariabondos falls in the Paulista district.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

Private Bills.

The Bognor Gas and Electricity Bill has been read a second time in the House of Lords. The North Metropolitan Electric Power Supply Bill has been read a first time in the House of Commons.

A Fatal Explosion.

On March 8th, Mr. Day asked the Minister of Transport whether his attention had been drawn to the evidence given at the coroner's inquest on a woman who received fatal injuries in an explosion at her home, due to the fact that an electric feeder laid down along the road by the District Council was over 25 years old and encased in bitumen, and was burnt away for about 18 in.; and if he could state whether a periodical system of overhauling was carried out, in accordance with the requirements of the Ministry.

Colonel Ashley said that the Electricity Commissioners had been informed by the electricity supply company concerned that a gas explosion was the cause of the damage to the cables, and that the cable where the accident took place was in no way connected to the adjacent mains encased in bitumen, which were situated on the opposite side of the street.

Broadcasting.

On March 8th, the Postmaster-General, replying to questions, said that the number of broadcast receiving licences issued during the year 1926 was 2,178,000, as compared with 1,642,000 in 1925. The total receipts amounted to £1,089,000 and £821,000 respectively. Experimental wireless licences had been issued to several persons to enable them to undertake experimental work in the direction of the broadcasting of both still and moving pictures. Several systems had been suggested, but the matter was not yet out of the experimental stage.

Transatlantic Telephony.

On March 8th, Sir W. Mitchell-Thomson informed Captain Crookshank that for the period January 7th-31st, the running costs of the British end of the Trans-Atlantic telephone service, including sundry expenses incidental to the initiation of the service, amounted to approximately £2,000, and plant charges—depreciation and interest—to a further £1,900. It was expected that the service would be self-supporting.

Call Boxes in Post Offices.

On March 8th, Capt. Crookshank asked the Postmaster-General whether he could form any estimate of what would be the cost of installing a public telephone call box in every post office in this country.

Sir W. Mitchell-Thomson said that no reliable figure could be given without compiling an estimate for each individual office, but the total would probably be not less than £2,000,000.

Rural Telephones.

On March 8th, replying to Mr, Rhys, Sir W. Mitchell-Thomson said that the number of new rural exchanges authorised during the years 1924, 1925, and 1926, was 211, 191, and 141 respectively.

Compasses for the Fleet.

On March 9th, Sir Harry Brittain asked the First Lord of the Admiralty if he was aware that all the gyro-compasses in the Fleet were of foreign origin; that the essential gyroscopical units were made abroad; that instructions to officers at the compass observatory and in the Admiralty manual were limited to this particular apparatus; and would he have inquiries made into the matter.

Lieut.-Colonel Headlam, who replied, said that the standard gyro compass used in the Fleet was the Sperry type (American). At the end of 1913, as a result of competitive trial, it was decided to adopt this type instead of the Anschutz (German), the only other gyro-compass then on the market. From that time until the end of the war, as a result of the above decision, the Sperry Company of Brooklyn supplied the British Fleet with gyro-compasses. The scrapping policy after the armistice released a large number of those compasses; they had been reconditioned, and used for further service. As this was the only type of compass in use in the Navy no object was seen in describing other types in the Admiralty manual. When it again became necessary for the Admiralty to purchase any considerable number of gyro-compasses it would afford an opportunity to firms to submit instruments for competitive tests at sea. The foreign-owned organisation (The British Sperry Company) employed British labour and material, and compasses manufactured for the Navy were now made in this country. A further trial of a gyro-compass made by a British-owned firm would shortly be instituted.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Campaign Notes, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

Our Trade Names Supplement.

Accompanying this issue of the Electrical Review we are circulating the fourth of our quarterly Trade Names Supplements.

The E.D.A.-E.L.M.A. Campaign.

The official report for the week ended March 12th says that during the week demonstration electric houses were opened at Durham, Sunderland, Blyth, South Shields, Halifax, and Peterborough, and that further houses were to be opened shortly in the following districts:—Halifax, Birmingham, Stoke-on-Trent (2), Derby, Tamworth, Whitley Bay, Whickham, Saltburn, Darlington, West Hartlepool, Annfield Plain, and Newcastle. The Carlisle house was kept open until March 12th, and up to the time of the report had been visited by 10 per cent. of the population. An average of 1,000 people a day were attending the Minard Road (Glasgow) house; coloured lighting was used freely in the rooms of this house. The average daily attendance at Chesterfield is 500, and contractors are said to be delighted with the results. During the first six days about 3,000 people inspected the Leicester house; 80 per cent. of the inquiries related to water heating. The exhibition at Dumfries is reported to have been a success from the business point of view. An electrical exhibition is being run at Yarmouth by the local circle, and an essay competition for boys and girls has been arranged. The North-East Coast children's painting competition was successful.

In last week's official report the attendance at the Aberdeen house during the first nine days was given as 899. This should have been 8,999—a somewhat larger figure!

In our last issue we reported the opening of an all-electric house at Sunderland. We have now received from the

The Sunderland Demonstration House.

Borough Electricity Department samples of literature distributed at the house and photographs, one of which is repro-

duced herewith. One brochure treats of the advantages of the electric home and is well illustrated, and there are pamphlets dealing with the Corporation's appliance-hiring schemes, hire-purchase wiring scheme, and continuous hiring arrangements. Sunderland has an attractive two-part charge for domestic consumers.

A further mass meeting of supply engineers and chairmen of electricity committees was held on March 11th at the Lighting Service Bureau, Manchester. Mr. P. P. Wheelwright, of Blackburn, was in the chair, and Mr. W. E. Bush was the principal speaker. The meeting was chiefly concerned with ways and means of distributing further competition booklets. It was decided to order another 20,000 from E.D.A., and various members of the audience promised to assist in the distribution of large numbers. Mr. Bush stated that up to March 7th 50,000 ballot papers had been received, and that they were coming in at the rate of 1,500 per day. This compared with 40,000 from another somewhat similar competition run by a popular paper.

E.D.A. Annual Meeting.

The annual meeting of the British Electrical Development Association was held at the Savoy Hotel yesterday (Thursday) afternoon. The annual dinner took place at night.

Humour in Advertising.

The British Thomson-Houston Co., Ltd., has sent us a copy of the "Rag Rag," a magazine produced by Manchester University students for their Hospital Week. The contents are refreshing, and the advertising section is most amusing The B.T.-H. advertisement claims that Mazda daylight lamps "enable you to see as well in Manchester by day as by night." An announcement relating to Ferranti l.f. transformers reproduces the company's well-known musical scale, and says "Learn to play this at sight by the Ferranti method without hours of arduous practice." The advertisement of the Chloride Electrical Storage Co., Ltd., is headed "Many an Oxide makes an Exide."

Great Britain's Radio Exports.

The *Wireless Trader* publishes details of the exportation of radio apparatus from this country during January. The total value of the goods (including valves, £11,532) was £88,765. The three most important customers were Japan (£14,684), Australia (£12,980), and Russia (£11,123).

Electric Power in Industry.

The second preliminary report upon the third Census of Production deals with the cotton, and other industries. It was issued as a supplement to the *Board of Trade Journal* for March 3rd. The increased use of electrical power in the cotton trade since 1907 is shown by the following statement, in which particulars of the capacity of electric generators in cotton mills in the two years are given:—

Electric generators. Driven by	1924. KW.	1907. KW.
Steam engines, reciprocating ...	80,092	28,906
Steam turbines	25,545	2,681
Other power	3,875	487
Total	109,512	32,074

The total horse-power of electric motors driven by electricity generated in cotton factories was returned as 128,506. In addition, electric motors of a total horse-power of 176,959 were included in returns received for the year 1924 as driven by purchased electricity. Of this aggregate, 12,299 h.p., or about 7.0 per cent., was "in reserve or idle." Similar particulars were not obtained for 1907.

In the boot and shoe trades, in 1924, there were 3,401 h.p. of electric motors supplied by electricity generated at the factories themselves, while 32,519 h.p. of motors were supplied from outside sources.

The rubber industry returns for 1924 showed that 36,747 h.p. of motors were driven by factory-generated power and 56,238 h.p. by purchased power.

In 1907 the paint and varnish trades had an aggregate of 512 kW generating power; the figure for 1924 was 3,006 kW. Of the 36,431 h.p. of electric motors in use in 1924, 23,568 h.p. of them derived their energy from outside sources.

The supplement to the *Journal* for March 10th shows that in the grain-milling trades electric motors aggregating 68,521 h.p. were installed in 1924; of these a total of 13,437 h.p. were driven by electricity generated in the mills. In the sugar and glucose trades the total capacity of installed generating plant in 1924 was 18,004 kW, as compared with 4,205 kW in 1907; the aggregate power of electric motors was 33,883 h.p., of which 30,394 h.p. was supplied by the industries' own generating plant. The spirit distilling trade in 1924 had generating plant amounting to 5,041 kW (as compared with 503 kW in 1907) and the total h.p. of electric motors installed was 9,128 h.p. (3,022 h.p. purchased). The spirit compounding, &c., trade only had 351 h.p. of electric motors installed, and the tobacco trade had 11,764 h.p., energy for 9,485 h.p. of this being purchased.

Commercial Electrical Travellers.

The Electrical Trades Commercial Travellers' Association is holding a carnival dance to-night (Friday) at Victory House, Leicester Square, W.C.2.

The Power Efficiency Exhibition.

As we have already reported, a Power Efficiency Exhibition is to be held in Manchester from June 22nd to July 2nd. This, for the first time, will cover in one specialised trade exhibition the whole field of steam and power generation, transmission and utilisation. One of the most important sections will be steam generation. Here there will be boilers of all types,, boiler fittings, coal crushers, coal- and ash-handling plant, economisers, feed-water heaters, mechanical stokers, soot blowers, pulverised fuel plant, weighing equipment, &c. Attention will be given to gas firing, low-temperature carbonisation, and the transmission of power. An important series of conferences, &c., is to be held during the exhibition. The manager of the exhibition is Mr. F. Nasmith, 121, Deansgate, Manchester.

Trade Announcements.

Messrs. E. Brook, Ltd., Empress Works, Huddersfield.—The name of the above firm has been changed to Brook Motors, Ltd. No change has been made in the personnel or management.

Messrs. E. Mercer, Ltd., radio engineers, Castleford, have opened additional premises at 36, Carlton Street, in that town.

Messrs. Young, Osmond & Young, Ltd., have removed to Excelsior Works, The Broadway, Bexley Heath, Kent. Telephone: Bexley Heath, 519.

New Catalogues and Lists.

Messrs. L. McMichael, Ltd., Wexham Road, Slough, Bucks.—Monthly circular to the trade, with a blotter and pamphlet advertising the company's multiple switch and h.f. transformers.

The Rees Roturbo Manufacturing Co., Ltd., Wolverhampton.—Circular R238, illustrating and describing the company's engine-driven pumping sets for agricultural and other purposes.

Messrs. F. Gilman (B.S.T.), Ltd., Regent Street, Smethwick.—A descriptive catalogue of "Skatoscalo" boiler-scaling and rust-removing tools.

Metro-Vick Supplies, Ltd., Trafford Park, Manchester.—Illustrated and priced pamphlets dealing with the "Litlux" bed light and the "Cadillac" vacuum cleaner; and a mailing card fully describing the "Emvee" lampholder.

The Universal Manufacturing Co., 3, The Grove, Blackheath, S.E.10.—A price list of electric lamps and a card bearing samples of coloured enamels—opaque and transparent.

The Foster Engineering Co., Ltd., Morden Works, Wimbledon, S.W.19.—A brochure illustrating and describing the company's outdoor sub-stations.

Ateliers de Constructions Electriques de Charleroi, 56, Victoria Street, S.W.1.—March stock list of dynamos and motors.

Messrs. Gent & Co., Ltd., Faraday Works, Leicester.—Book 4, describing, with illustrations, electric watchman's or "tell-tale" clocks. Priced.

Philips Lamps, Ltd., 145, Charing Cross Road, W.C.2.—Leaflet No. 80, giving details and prices of "Philips" h.t. supply units for a.c. or d.c.

The Yorkshire Electric Transformer Co., Ltd., Dewsbury.—An illustrated leaflet advertising transformers for rural distribution.

Priorsells, Ltd., 110, Cannon Street, E.C.4.—A priced booklet and a series of pamphlets illustrating and describing the company's ultra-sensitive selenium cells for numerous applications.

The Grout Engraving Co., Ltd., 7, Bridewell Place, E.C.—Two illustrated booklets dealing with the company's work and containing examples.

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—Leaflet No. X4355, illustrating and describing switches for service in theatres, &c. Priced.

The Hart Accumulator Co., Ltd., Stratford, E.15.—A list of distinguished users of "Hart" batteries.

Siemens & English Electric Lamp Co., Ltd., 38-39, Upper Thames Street, E.C.4.—Catalogue No. 160, dealing very fully with the "Siemens-Xcel" domestic electrical appliances, ranging from large cookers to irons. Priced and illustrated. Notes on running costs are included.

The Electric Furnace Co., Ltd., 17, Victoria Street, S.W.1.—Pamphlet D.2, describing the company's electric resistance furnaces. Illustrated.

The Mullard Wireless Service Co., Ltd., 21, Denmark Street, W.C.2.—A comprehensive catalogue of the company's valves, containing illustrations, details and prices of about 50 types—transmitting, detecting, amplifying, and modulating.

The Westinghouse Electric & Manufacturing Co., East Pittsburg, Pa., U.S.A.—Illustrated pamphlets, dealing with a vest-pocket ammeter and a cabinet portable voltmeter for radio purposes.

Messrs. Baxter & Caunter, Ltd., 219, Tottenham Court Road, W.1.—March price list of electrical materials, appliances, and accessories. Fully illustrated.

The Marconiphone Co., Ltd., 210-212, Tottenham Court Road, W.C.2.—Two coloured posters, one dealing with a three-valve receiver employing "K.L.1" and "U.5" valves, and the other advertising the "Marconiphone" h.t. supply unit. Also a window slip advertising "Marconi" valves.

The Bastian Meter Co., Ltd., 58, Haymarket, S.W.1.—An illustrated and priced pamphlet, giving particulars of "Bastian" storage geysers.

Messrs. Hans Renold, Ltd., Burnage Works, Didsbury, Manchester.—An illustrated catalogue of "Renold" chains, &c.

BROOK MOTORS, LTD., Empress Works, Huddersfield.—An illustrated catalogue of single-, two-, and three-phase motors, squirrel-cage and slip-ring types.

THE LONDON ELECTRICAL CO., 1, Sherborne Lane, King William Street, E.C.4.—A well-illustrated, priced catalogue of radio receiving sets, components, and accessories.

Bankruptcy Proceedings.

A. J. GARROD, manufacturer of valves, sets, and parts used in wireless telegraphy, Whitehorse Place, Wellingborough.—Receiving order made March 4th, on creditor's petition. First meeting, March 21st, at the Official Receiver's office, The Parade, Northampton. Public examination, April 1st, The County Hall, Northampton.

O. WALKER (Albion Electric Co.), electrical contractor, 112, Albion Street, Wallasey.—First meeting, March 21st, at the offices of the Official Receiver, 11, Dale Street, Liverpool. Public examination, April 6th, at the Court House, Birkenhead.

Company Liquidations.

SELLING WIRELESS, LTD.—A meeting of members is called for April 12th, at the office of Messrs. Lee & Whitfield, Bank of Liverpool Chambers, Park Row, Leeds, to hear an account of the winding up from the Liquidator, Mr. J. A. Couper.

WIRELESS VALVES, LTD.—A meeting of members is called for April 20th, at the offices of Messrs. Blakemore, Elgar and Co., 9, King's Bench Walk, E.C.4., to hear an account of the winding up from the Liquidator, Mr. G. Freire-Marreco.

BRITISH WIRELESS SUPPLY CO., LTD.—First and final dividend on preferential claims of 8s. 4½d. in the £, payable at 12, Northgate, Bradford.

FOOLPRUFE PATENT ACCUMULATOR CO., LTD.—Winding up voluntarily. Liquidator, Mr. G. T. Berry, 32, The Square, Market Harborough. Meeting of creditors, March 25th, at 44, High Street, Market Harborough. Particulars of claims to the Liquidator by April 9th.

KNIVETOWN ELECTRIC WIRE CO., LTD.—Particulars of claims by April 16th, to the Liquidator, Mr. S. W. Tubbs, 24, Basinghall Street, E.C.

WOODSTOCK ELECTRIC LIGHT CO., LTD.—A meeting of members is called for April 4th, at the Town Hall, Woodstock, to hear an account of the winding up from the Liquidator, Mr. V. N. Tolley.

Dissolution of Partnership.

PARKINSON & TALBOT, plumbers, electricians, &c., Clayton West, near Huddersfield.—Messrs. W. A. Parkinson and J. E. Talbot have dissolved partnership.

Private Arrangements.

R. D. TREVOR ROPER, 6a, St. Leonards Road, Bexhill-on-Sea, electrical and radio engineer.—A meeting of creditors was held at the offices of Messrs. Poppleton, Appleby & Hawkins, 4, Charterhouse Square, E.C., on March 9th, when Mr. E. H. Hawkins said that the debtor commenced trading on his own account four years ago as an electrical and wireless dealer. Later, he removed to premises in St. Leonards Road, and also took over a shop at another address. Last October the debtor required further capital and it was arranged that £200 should be put up provided a limited company was formed. A limited company was formed on October 20th last, and the purchase price which the company paid was £1,205, which was satisfied by fully-paid shares. The nominal capital of the company was £2,000, and shares were issued to the extent of £1,407. Instead of the debtor keeping the shares for himself he only took over 500, and the remainder were issued to his nominees, principally for cash advanced to the debtor before the limited company was formed. The debtor's own personal debts amounted to £615, and there were costs and other charges. The debtor had intimated to Mr. Hawkins that he understood that the limited company would discharge his liabilities, but Mr. Hawkins had gone into the matter, and so far as he could see there was no legal claim on the company. The debtor had been sued by several creditors, one of whom had issued a bankruptcy notice. The debtor had intimated to the creditors that he was prepared to offer a cash composition of 5s. in the £ in settlement of their debts. Several of the creditors had written to say that they were prepared to accept the offer, including the petitioning creditor. The creditors present recommended the acceptance of the debtor's offer, and it was decided that the suing creditors' costs should be paid in full.

E. W. DICKIE, trading as E. W. Dickie & Co., 13, The Broadway, Gleneagle Road, Streatham, S.W., electrical and radio engineer.—A meeting of creditors was held recently at the offices of Messrs. Veitch & Co., C.A., 9, Coleman Street, E.C., when Mr. H. J. Veitch presented a statement of affairs which showed liabilities of £1,469 and net assets of £554, leaving a deficiency of £915. There was also a lease of unascertained value. According to the trading figures presented for the two years ended December 31st, 1920, the sales were £6,210, there was a gross profit of £1,289, the expenses were £847, and there was a net profit of £442. The drawings were £522. For the year ended December 31st, 1921, the sales were £3,453, on which a gross profit was made of £1,014. There was a net profit of £266, and the debtor drew £402. During the following year there was a profit of £57 on sales of £2,505, while for the year ended December 31st, 1923, the profit was £374 on sales of £3,139. During the following year the sales were £2,535, there was a gross profit of £688, and a net profit of £126. During that period the debtor drew £283. For the following twelve months the sales were £2,425, there was a gross profit of £814, and the net profit was £256. The debtor drew £286. From January 1st, 1926, to March 8th, 1927, the sales were £2,039, the gross profit was £549, and there was a net loss of £36. The debtor drew £247. It was decided that the estate should be dealt with under a deed of assignment in favour of Mr. H. J. Veitch and Mr. A. J. Osborne, of Balfour House, Finsbury Pavement, E.C., as joint trustees, together with a committee of inspection consisting of the representatives of the Hart Accumulator Co., Ltd., Edison Swan Electric Co., Ltd., and Mr. P. S. Booth, representing creditors.

J. A. SMITH and C. H. MALLEY, trading as the Boro' Electric Co., 457, Borough Road, Birkenhead, electricians.—A meeting of creditors was held recently, at the offices of Mr. C. Semper, Liverpool, when a statement of affairs was presented which disclosed liabilities of £743, and assets of £130, leaving a deficiency of £613. The business was established on February 1st, 1923, with a capital of £200, found by Malley. Of that amount £100 was his own money, and £100 was lent to him by his father. The sum of £120 was expended in fitting up and decorating the shop. A full set of books had not been kept, but it was estimated that during the year ended January 31st, 1924, the turnover was £1,500, and in the following twelve months it increased to £1,700. During the year to January 31st, 1926, the turnover was about £2,000, and during the following year it was about the same amount. On February 4th the landlord distrained for rent, and a distraint for rates was also levied. The stock, which was estimated by the debtors to have cost £150, was removed for sale, and the debtors believed that it realised rather more than £50. The present position was attributed to losses on contracts and lack of capital. No definite offer was submitted, and no resolution was passed. The creditors include:—

	£		£
Advance Lamp Co. ...	153	Karpax, Ltd.	20
Henry & Paris, Ltd. ...	31	General Electric Co., Ltd.	202

H. A. RATCLIFFE, trading as United Agencies (Western), electrical and wireless dealer, 15, Charles Street, Cardiff.—A meeting of creditors was held on March 7th, at the offices of Messrs. Phœnix & Levinson, Cardiff, when the representative of Messrs. Siemens Bros. & Co., Ltd., one of the principal creditors, was elected to the chair. The statement of affairs presented showed liabilities of £7,208 and net assets of £1,622, leaving a deficiency of £5,586. The debtor commenced trading on June 1st, 1925. Prior to that date he was the local manager for a well-known firm in the trade. The debtor commenced with about £500 in cash, received from his father, who guaranteed the bank to the extent of £2,000. It was also understood that the father had guaranteed certain of the creditors' claims. During the past few months the debtor had been in ill-health. He was recently pressed by creditors, and on March 2nd executed a deed of assignment to Mr. Holbrook. There was a total loss of £6,086, accounted for by a loss on trading, bad and doubtful debts, written-off stock, depreciation, and personal expenditure. The turnover since the commencement had been £11,871. A resolution was passed confirming the deed of assignment already executed to Mr. Holbrook, and it was also decided that the debtor should be given seven days in which to find cash for the payment of a composition of 5s. in the £, failing which the estate should be realised under the deed, under the supervision of a committee consisting of the representatives of Messrs. Siemens Bros. & Co., Ltd., Poppleton & Appleby, Birmingham, and Clarke, Dovey & Co., Cardiff. The following are creditors:—

	£		£
Belling & Co.	42	Marconiphone Co., Ltd.	195
Benjamin Electric, Ltd.	25	Nathan, Frank J., & Co.	34
British Thomson-Houston Co., Ltd.	24	Oldham & Son, Ltd. ...	32
Chloride Electrical Storage Co., Ltd.	67	Philips Lamps, Ltd. ...	61
Ferranti, Ltd.	67	Radio Instruments, Ltd.	25
Graham Amplion, Ltd....	50	Shanks & Co., Ltd. ...	22
General Electric Co., Ltd.	771	Siemens Bros. & Co., Ltd.	275
Hardwicke, C. J.	21	Wolff, M. & A.	39
		"Z" Electric Lamps and Supplies Co., Ltd.	117

Deed of Assignment.

J. L. COURYER, electrical engineer, 181, Perth Road, Dundee.—Particulars of claims by March 21st, to the Trustee, Mr. P. J. McIntyre, 20, Reform Street, Dundee.

New Municipal Showrooms and Offices.

The Fulham Electricity and Lighting Committee has recommended that premises in Fulham Road be demolished and that new showrooms and offices be erected on the site at an estimated cost of £13,000.

At a meeting of the Nottingham Society of Engineers, on March 7th, strong opposition was raised to the projected establishment in Nottingham of a municipal showroom for electrical appliances, it being argued that if such an arrangement were made it would result eventually in the local supply undertaking losing the salesmanship of an enterprising body

of contractors. Mr. G. S. Haydon, resident engineer at the North Wilford power station, contended, however, that such a showroom would be a valuable asset in educating the public. It need not sell directly at all, but might refer inquirers to firms of contractors.

For Sale.

Mr. G. R. Lightfoot will sell by auction, on March 31st and following days, at 13, High Holborn, W.C., wireless and electrical trade stocks. By order of the D.A.D.O.S., Messrs. Horne & Co. will sell by auction, on April 5th, at Hilsea Lines Ordnance Depôt, Cosham, Portsmouth, electrical plant, cable, hand and machine tools, &c. By direction of the trustees, under a deed of assignment, Messrs. Trubshaw and Taylor will sell by auction, on March 30th and 31st, at 3 & 5, Mansell Street, Aldgate, E., the stock of an electric, gas and water fittings manufacturer, &c. (See our advertisement pages to-day.)

Social Events.

The Hackbridge Cable Company's Sports Club is holding its annual dinner at the Grey Hound Hotel, Carshalton, on Saturday, April 9th.

On February 25th the staff of the London Electric Wire Co. & Smiths, Ltd., held their annual ball at the Hotel Metropole, over 150 members of the staff and their friends being present. The gathering was representative of the board, the London office, the Leyton works, and the provincial branches.

The electrical staffs of the Doncaster Collieries Association, Ltd., held their second annual dinner and dance recently. Mr. C. C. Bleack, electrical engineer to the company, mentioned, in replying to a toast, that the amount of energy generated by the associated companies had risen from 16,250,000 kWh in 1922 to 27,330,000 kWh in 1925. Last year it fell to 21,500,000 kWh; had it not been for the coal stoppage it would have been something like 33 million kWh. Representatives of many of the leading electrical companies were present at the dinner.

The Electricity Supply Commercial Association (Greater London Division) is holding a dance on Saturday evening, March 26th, at the Poland Rehearsal Rooms, 49, Poland Street, W.1. Tickets can be obtained from delegates and the divisional and general secretaries.

The annual staff dinner of the Sterling Telephone and Electric Co., Ltd., was held at the Abercorn Rooms on March 4th, and was, as usual, well attended. The chair was taken by Mr. W. H. Peak, O.B.E., managing director, supported by Mr. C. E. Hunter, works manager, and Mr. N. Blades, chief telephone engineer. An excellent musical programme, provided by members of the staff, completed a very enjoyable evening.

Unemployment.

The Employment Exchange returns show that the number of unemployed continues to fall. On February 28th the total was 1,169,500, as compared with 1,196,060 on February 21st, and 1,107,140 on March 1st, 1926. The increase, as compared with last year, is due to the fact that there are 97,000 fewer men employed in the coal-mining industry; in most other branches conditions are better.

The Peruvian Market.

Mr. J. P. Trant, British Consul at Callao, has recently forwarded to the Department of Overseas Trade a report (dated October, 1926), upon the commercial, economic, and financial conditions in Peru. The general impression gained from Mr. Trant's introduction is that Peru is a settled country and has made considerable progress in the direction of important public works. Unfortunately, this policy of improvement has proceeded too rapidly, with the result that the public debt has increased to an abnormal extent, with a corresponding rise in taxation, which has affected industry badly. The mining industry, which is mainly under foreign control, maintained its position during 1925, when the production of copper rose in value from £P2,406,031 to £P2,829,666, and that of lead from £P37,171 to £P191,693. The statistics of foreign trade during the first six months of 1926 give the value of imported electrical goods as £179,714. In 1925, the value was £372,784. It is stated that the charges for electricity in the capital, Lima, are high, and restrict its use to lighting in the domestic sphere, and to the occasional pumping of water. There is consequently no market for cooking and heating apparatus. The demand for crude-oil engines for generating electricity, on the contrary, has been stimulated. Industrial development has been retarded by the high cost of power. Interest in broadcasting is stated to be languishing on account of the difficulties of providing suitable entertainment and picking up distant stations owing to atmospherics. The post and telegraph services have been taken over by Marconi's Wireless Telegraph Co. Ltd., for a period of 25 years. There are a number of small public telephone companies operating in Peru, but the Marconi Co. has secured preference in opening up new districts. In the Peruvian market keen American competition is encountered; conditions are all in favour of the United States. The appointment of local agents is advised rather than the sending of travellers, whose way is not made easy. The need for Spanish in communication is stressed.

The Basle Fair.

Details of this year's Swiss Industries Fair which will be held at Basle from April 2nd to April 12th, are now available. The new permanent fair buildings, which have been under construction during the past three years at a cost of ten million Swiss francs are now completed. They comprise, in addition to the six exhibition halls, a series of social and business rooms for the convenience of buyers, including private offices in which current business may be conducted. Special fare reductions will be granted to visitors to the Fair by the Swiss Federal Railways. An illustrated brochure has been issued by the fair authorities, and is obtainable from them or from the Swiss Legation in London.

Gift to Bradford Technical College.

Messrs. Jessop & Boydell, Ltd., electrical engineers and contractors, of Bradford, have made a gift of electrical instruments and resistances to the Electrical Engineering Department of the Bradford Municipal Technical College, and have received the thanks of the Technical Education Sub-Committee.

"Hand-to-Mouth" Buying.

A symposium of American views upon this subject, which is of great importance to manufacturers, is reproduced in the January *Journal* of the British Empire Chamber of Commerce in the United States. Generally speaking, the manufacturers condemn the practice of buying for immediate needs only; one of them states that it increases overhead charges to a great extent. Others realise that the improvement of transportation facilities has made the practice feasible for the retailer, and that view is put with some force by the president of the Pennsylvania Railroad (Mr. W. W. Atterbury). He says that the confused ideas upon the subject give the phrase "hand-to-mouth buying" an odium which is unreasonable.

"Forward buying in the sense that term was used years ago is no longer necessary or, in my opinion, desirable. There are several reasons for this: The transportation services now available eliminate risk that goods or supplies will not be on hand when wanted; piling up inventories is, industry has found, an undesirable practice; forward buying accentuates seasonal activity with corresponding slumps in employment; buying on an as-required basis spreads our production more evenly; and the tendency towards changes in design and requirements makes it undesirable to stock great quantities."

The *Journal*, while it can discern no effect of the policy at present, considers it possible that industry will in the future have to adjust itself to the altered conditions.

Local Exhibitions.

Bradford.—To wind up an Ideal Homes Exhibition, held for the first fortnight of March at Bradford—at which the Bradford Corporation Electricity Department had a series of highly attractive demonstration stands—a ball was given by the exhibition promoters on the evening of March 10th, and during the evening gold and silver medals were presented to the exhibitors whose stands had been declared, by a public ballot, to be the most popular. The Bradford Electricity Department secured the silver medal for local exhibits.

Epsom.—During the whole of last week an electrical exhibition, organised by the municipal Electricity Department was held at the Lecture Hall, Epsom. Messrs. Absalom & Garland, a local firm of electrical contractors, actively co-operated with the Department and exhibited a representative range of "Magnet" domestic appliances and lighting fittings.

Hampstead, N.W.—Products of the General Electric Co., Ltd., are also to form part of a "Science in Industry" exhibition which is to be held from March 29th to 31st at the Haberdashers' Aske's Hampstead Schools, Westbere Road, N.W.2. These will include a working refrigerator unit, lamps, and valves, &c.

The Canadian Market.

In the course of a recent letter to us, Mr. J. R. Cowley, city electrical engineer of Saskatoon, Saskatchewan, says:—"There is no reason why British manufacturers should not obtain a larger share of purchases in Western Canada other than the lack of representation and knowledge as to what is being done by them along the lines in which we are interested. It is the intention of this department to obtain tenders from British firms before placing contracts for steam and electrical equipment in the future."

The B.E.A.M.A.

The annual meeting of the British Electrical and Allied Manufacturers' Association was held in London yesterday (Thursday).

New Swiss Company.

A company has lately been formed in Geneva (17, Boulevard Helvetique) with the title La Société des Applications Electriques, to exploit the Swiss agency for the Frigidaire Corporation, of Dayton, U.S.A.

New Indian Companies.

Among the concerns recently formed in India in connection with electricity supply, are the Meerut Electric Supply Co., 3, Burn Bastion Road, Delhi, with a capital of 15,00,000 rupees, and the Baluchistan Electric Supply Co., Quetta, capital 10,00,000 rupees.

Chinese Company's Reorganisation.

The Great Eastern Battery Manufacturing Co., Shanghai, recently underwent reorganisation, increasing its capital by 50 per cent. and adding a carbon manufacturing department. The company makes batteries for radio work, flashlamps and bells, including the component parts of these.

Book Notices.

"Modern Industry." By Malcolm Sparkes. Pp. 64. London: Student Christian Movement. Price 1s. 3d. net.—"This booklet," says the Publisher's Note, "is intended primarily for those who are concerned about the relationship between Christianity and social problems." Its sub-title is "The Christian Line of Development," and it leads up to the control of industry by "industrial councils," with a view to raising wages and lowering prices.

"The Electricity (Supply) Act, 1926." By T. J. Sophian. Pp. vi+62. London: Sweet & Maxwell, Ltd. Price 4s. 6d. net.

The *Queen's Engineering Works Magazine* for January, received last week, is appropriately dedicated to the memory of the late founder of the works and chairman of the company, Mr. W. H. Allen, a portrait of whom forms the frontispiece. It is an excellent number, of 94 pages, containing many interesting articles.

"Electric Switch and Controlling Gear," by Dr. C. C. Garrard. Third Edition. Pp. xiv+783; figs. 649. London: Ernest Benn, Ltd. Price 63s. net.

"The Operation of Receivers from A.C. Mains." Pp. 8; 3 diagrams. London: Marconiphone Co., Ltd. Price 6d.—This booklet contains useful information for the conversion of wireless receivers of the multi-valve type for operation entirely off a.c. mains with the aid of KL.1 valves. The subject is dealt with in general terms to make the information universally applicable. The additional components required are enumerated and their prices mentioned.

"Chemical Engineering and Chemical Catalogue." Third Edition. Edited by D. M. Newitt, Ph.D.; p. 404; fully illustrated. London: Leonard Hill. Price 10s. 6d.—In this new edition of the chemical engineering catalogue considerable additions have been made in both the number of subscribers and the tables and data contained therein.

"Electric Power Stations," by L. W. W. Morrow. Pp. viii+326; figs. 177. London: McGraw-Hill Publishing Co., Ltd. Price 20s.

Australian Radio Action.

The Sydney *Daily Telegraph* reported recently that writs had been issued on behalf of Amalgamated Wireless (Australasia), Ltd., claiming £25,000 against the provisional directors of Victoria Radio Interests Pty., Ltd., for alleged trade libel in an advertisement published in certain Melbourne newspapers.

A Commercial Travellers' Club.

Mr. C. J. Kebbell, the secretary, has sent us particulars of the British Commercial Travellers' Club which is to be opened to-morrow (Saturday). The premises are situated at 24-28, New Oxford Street, W.C.1, and all the usual club facilities are provided. Membership is open to all commercial travellers and such other persons as may be approved by the Committee. The subscription is one guinea per annum.

A New Way of Packing Flex.

Messrs. W. T. Glover & Co., Ltd., have recently abandoned the old method of packing flex, *i.e.*, by coiling it, and are now doing it up in the form of balls as is usual with string. Packed in this way it can be pulled through a hole in the carton, whence it comes smooth, clean and unkinked.

Recent Contracts.

The Alton Battery Company, Ltd., has received a contract from the Nottingham Corporation for a battery of 256 cells for the North Wilford power station. During February three further orders for power station batteries were placed with the company, two being for Greece and one for Buenos Aires.

The Electric Furnace Co., Ltd., 17, Victoria Street, S.W.1, has received further orders for high-frequency electric furnaces for the manufacture of high-grade tool steel from Messrs. W. Jessop & Co., Ltd., Sheffield, and J. Holtzer & Co., Unieux, France. Each installation will be capable of melting about four tons of alloy steel per day.

Messrs. Simon-Carves, Ltd., have recently secured an order from the Whitehaven Colliery Company for firing three boilers with pulverised low-grade fuel. Other orders which the company has in hand include the final extensions at the Prince's Station, Nechells, Birmingham, where four Simon-Carves boilers, each rated to evaporate 150,000 lb. per hour on normal load (180,000 lb. on overload) are being installed with coal drying, pulverising and feeding equipment on the company's "Central" system; extensions at the Peterborough Corporation, including coal drying, pulverising and feeding equipment, 12 tons per hour; and for the Tilmanstone (Kent) Collieries, Ltd., the addition of Simon-Carves patent water-cooled combustion chambers to two Stirling boilers and the necessary pulverising plant.

The Pirelli-General Cable Works, Ltd., has secured an order from the Coventry Corporation for the supply and installation of approximately 30 miles of 3-core cable for a working pressure of 33,000 V. Each core of these cables will be separately lead sheathed and the three cores laid up together. The cable is made circular by means of tanned jute fillings, and the whole is then lapped with two compounded hessian tapes, which form the bedding for the single wire armour. The cable is compounded double hessian taped overall. The cables will connect the new super power station at Hawkesbury with the existing generating station at Sandy Lane, and with two sub-stations.

The General Electric Co., Ltd., has recently secured the contract for a complete cyclorama, cloud apparatus, panorama projectors, and a full battery of horizon colour floods for the New Carlton Theatre, Haymarket. It is also supplying a complete set of special 100-contact open coil metallic type dimmers arranged for remote control; the contractors are the Berkley Engineering Co. A further contract has also been secured for the stage lighting equipment which is being installed at the new Park Lane Hotel, W., which is to be opened shortly. The electrical contractors are Messrs. Tredegars.

Messrs. Hick, Hargreaves & Co., Ltd., have secured the order for the whole of the condensing plant and auxiliaries for the new Hams Hall generating station for the Birmingham Corporation.

Prices of Materials.

Messrs. James Forster & Co. reported on March 12th that the lead market became unsettled by the sudden declaration of a considerable tonnage of lead for early arrival from Burma, which brought about a fall on March 7th and 8th of 13s. 9d. a ton. The tone was afterwards steady, with prices practically unchanged, closing at £28 2s. 6d. for March, £28 6s. 3d. for April, £28 8s. 9d. for May, and £28 11s. 3d. for June. "In consequence of the drop in values, the home demand quietened down, consumers being somewhat apprehensive of any further fall. Buying, however, must be resumed before long, and the steadier conditions now prevailing will help confidence to return."

Messrs. Lindsay & Williams, Ltd., following their usual practice, have sent us a copy of their chart showing the course of prices of raw materials for the cable industry during 1926. The curves deal with American cotton, plantation rubber, h.c. copper wire, and pig lead.

Prices of Raw Materials.

Messrs. F. Smith & Co. report, March 15th: Copper (electrolytic) bars, £63, 2s. 6d. dec.; ditto ditto sheets, no change; ditto ditto wire rods, £73, 2s. 6d. dec.; ditto ditto h.c. wire, 9 3/16d., 1/16d. dec.

Messrs. James & Shakespeare report, March 15th: No change in the prices of copper bar, sheets and rod, and English pig lead.

Messrs. Edward Till & Co. report, March 15th: India-rubber, Para fine, 1s. 5¼d., ¾d. dec.

Greek Telephone Concessions.

For the purpose of reorganising and extending the Greek telephone system, a new company was formed a little time ago with a capital of £500,000. Of this amount, 80 per cent. was subscribed by Siemens & Halske, and the remaining £100,000 by a Greek group. In this connection it may be recalled that about the middle of last year it was reported that a Belgian-English group had been granted a concession for the extension of the Greek telephone system.

Lighting and Power Notes.

Argentina.—Hydro-Electric Development.—By Presidential decree a commission is to be nominated to make a complete survey of the water power resources of Argentina. For this purpose a Hydraulic Investigation Bureau has been established under the Ministry of Public Works. The chief engineer will be Señor Don Lépori, who has been sent to study the principal water power resources of the United States and their application.—*Reuter's Trade Service* (Buenos Aires).

Australia.—Collie (W.A.).—The *Electrical Engineer* of *Australia and New Zealand* reports that steps are being taken to proceed with the electricity scheme for the towns of Collie and Bunbury and the surrounding districts in Western Australia. An Act of Parliament authorising the scheme and laying down the lines upon which it is to be controlled and financed has been passed. The undertaking will be administered by a trust consisting of five members, three of whom, including the chairman, will be appointed by the Government, and the other two by the municipalities of Collie and Bunbury. Of the necessary capital, the municipality of Collie will subscribe £60,000, the Bunbury municipality £50,000, and the Government £110,000. It is estimated that a station to meet the expected demand can be erected at a cost of £216,000. The present proposal is to supply the towns named and all towns and districts within a radius of about 40 miles of Collie. The energy will be sold in bulk to the various local authorities. Bulk supplies will be provided also for the coal mines at Collie. Electricity will be supplied to the mines at 1¼d. per kWh and to other consumers at 2d. per kWh.

Barmouth.—Electricity Supply.—It was reported at a recent meeting of the Urban District Council that the Electricity Commissioners have decided not to proceed with an application from Aberartro for an Order to supply electricity in the district. The application has been under consideration for three years, and £20,000 has been spent on initial work by the promoters. A sub-committee has been appointed to consider alternative schemes.

Barrow.—Extension Scheme Rejected.—The Electricity Commissioners have refused to sanction the scheme for extensions to the Corporation generating station at a cost of £60,000, and propose that other arrangements should be made to meet local requirements. The Council has appointed a deputation to interview the Commissioners.

Loan Sanctioned.—The Town Council has received sanction to the borrowing of £44,591 for main transmission line, mains and services, sub-station equipment and meters.

Brazil.—Hydro-Electric Development.—The Governor of the State of Rio de Janeiro has ordered a report to be prepared on the water-power resources of the central regions with a view to furnishing power for industrial purposes to several municipalities, including Sao Franciscao de Paula, Santa Maria Magdalena, and Sao Sebastiao do Alto. Industrial plants will be first established in the larger towns such as Campos Macaché, and Nictheroy.—*Reuter's Trade Service* (Rio de Janeiro).

Bury (Lancs.).—Street Lighting.—The Town Council has applied for sanction to a loan of £5,000 for lighting the main roads in the borough by electricity.

Canada.—Electrical Development.—A mercury-arc rectifier sub-station was put into operation at Verdun, Que., on February 9th by the Montreal Tramways Co. to meet the increasing needs for power in the city of Verdun and the vicinity, at a cost of $200,000. The station pressure is 12,600 V a.c., which is converted by transformers and rectifiers into direct current at 600 V. The electrical equipment was supplied by the Brown Boveri Co. of Baden, Switzerland; Nicholson Construction, Ltd., were the building contractors.

The Algoma District Power Company has decided to install an additional unit of 2,000 h.p. at Michipicoten Falls at once; plans are under consideration for rendering available the full capacity of the Falls. To do this will involve the removal of a large hill 150 ft. high and about 100 yards in length, so that the present bend of the river can be tapped for a new sluiceway. This will be a difficult and costly work, and a force of engineers is engaged in a preliminary survey. It is planned to remove the loose sand by hydraulic piping, and, in addition, there will be a great deal of rock work.

Cardiff.—Assisted Wiring Scheme.—The Finance Committee has considered the proposal of the Electricity Committee to set aside £20,000 towards the cost of an assisted wiring scheme, under which the Corporation would wire houses and install the necessary electrical fittings for lighting and heating purposes, and spread the cost over a period of years. According to the *Western Mail*, the chairman of the Electricity Committee states there are some 40,000 houses in the city, of which at least 30,000 do not use electricity. It is estimated that orders would come in for the wiring of at least 2,000 houses under the proposed scheme, and as it is not intended that the scheme should apply to houses with more than seven lights, the average cost of installation is placed at £10 per house. Instead of charging 4½d. per kWh, the customer would be charged, say, 8d. per kWh until the difference in the unit charge had wiped out the cost of the installation. The matter has been referred back to the Electricity Committee to prepare a complete scheme.

Clitheroe.—Inauguration of Supply.—An electricity supply for the district was formally inaugurated by the Mayor on March 9th. Electricity is supplied from the Lancashire Electric Power Co.'s station at Padiham to the Council's substation, in which two 300-kW transformers are installed. Accommodation has been provided for four additional transformers. The scheme included the laying of 14,000 yd. of distributing cable, 4,500 yd. of public light cable, and 5,000 yd. of e.h.p. cable, and the cost was £25,000. To celebrate the event a scheme of illumination was carried out.

Continental.—Russia.—The Glavelektro has presented a report to the Gosplan (State Planning Commission) on the plan for the electrification of the Donetz basin. The Glavelektro is in favour of the construction of small stations of from 12,000 to 20,000 kW, in addition to large stations of from 80,000 to 100,000 kW. Investigations are to be made this year in three districts in order to determine the site of a regional power station of 100,000 kW, so that a definite start can be made during the next financial year with the construction of the station. The independent construction of power stations, utilising gas plant, by metal works is approved, and it is estimated that during the next five years it will be necessary to order 13 sets with a capacity of 3,500 kW for the works belonging to the Southern Steel Trust (Yugostal). By the year 1930-1931, the Donetz basin will have, according to the plan, regional and subsidiary power stations with a total capacity of from 240,000 to 300,000 kW, excluding independent installations at various works. The Glavelektro insists on the necessity of using not only coal dust and coal of inferior quality, but also other waste matter, such as steam used in certain processes and gases from coke ovens and blast furnaces. —*Reuter's Trade Service* (Moscow).

A *Reuter* message from Leningrad says that at a recent meeting of the regional Elektroplan a report on the proposal for a hydro-electric power station on the Neva (Nevstrol) was finally approved. The station is to have a capacity of 60,000 kW, and the cost of construction is placed at 74,000,000 roubles. The plan is being sent to Moscow for approval by the Glavelektro.

The Berlin correspondent of the *Financial News* reports that the Soviet Government, after several years of consideration, has decided to carry out a project for the construction of a hydro-electric power plant on the river Dnieper and for improving the navigation facilities of the river. The Siemens Construction Union has been asked to send several engineers for the supervision of the work, and it is also to submit plans and details for the project. An American firm has also obtained a similar contract. The scheme is said to include the construction of a power station with a capacity of 650,000 h.p.

Germany.—What is claimed to be the largest Diesel engine for electricity generation purposes so far built has recently been constructed by the Blohm & Voss Shipbuilding and Engineering Co., of Hamburg, Germany, for the Neuthof power station of the Hamburgische Elektricitätswerke Gesellschaft. The engine, which develops 15,000 h.p., comprises nine cylinders having a bore and stroke of 860 mm. by 1,500 mm., the normal speed being 94 r.p.m. The engine is of the two-cycle type with a new system of scavenging the burnt gases, and is 76¾ ft. in length, 14 ft. in width, and 38¾ ft. in height. The three-phase generator, built by the Siemens-Schuckert Co., of Berlin, to which the engine is directly coupled, is also claimed to be the largest so far constructed; it is a 50-period, 6,000/6,300-volt machine and has a capacity of from 12,000 to 13,000 kVA. The stator has an external diameter of 26.8 ft. and a width of 7 ft. 2 in. The machine weighs altogether 233 tons, of which the flywheel rotor, which has 32 pairs of poles, is responsible for 111 tons.

Switzerland.—Contracts have been placed for the construction of the Ryburg-Schworstadt hydro-electric power station which is to be erected on the banks of the Rhine. The station will be built by the Motor Columbus Co., of Baden, and the transmission lines will be erected by the Rheinfelden Power Transmission Co. and the Baden Provincial Electricity Supply Co., of Carlsruhe. The station will have an output of 640 million kWh per annum.

Crediton.—Electricity Supply.—At a recent meeting of the Urban District Council a letter was read from Mr. Melhuish, the Council's electrical engineer, stating that the proposed scheme for the supply of electricity to the town had already dragged on for about five years and that it was now absolutely necessary for the Council to appoint an engineer to supervise the work, more particularly with regard to the erection of the h.p. lines from Exeter to Crediton. He stated that when in 1922 he arranged to assist the Council with the proposed scheme the intention was to have a small generating station and construct a distribution network in the town. Since then, however, that scheme had been abandoned, and it had been decided to take a supply from Exeter. He suggested that he should resign his appointment when the Council had chosen an engineer, which must be before the work was started, but he was prepared to act as honorary consulting engineer. The Council decided to invite Mr. Melhuish to meet it at once for a discussion of the matter.

Crowborough.—Electricity in Bulk.—The Crowborough District Gas and Electricity Co., which is carrying out extensions, has arranged for a bulk supply of electricity for the Tunbridge Wells Corporation.

Hastings.—Electricity Extensions.—The Electricity Committee reports that, owing to the increase in load on the electricity mains, it has become necessary to extend and renew h.p. mains and erect and equip new sub-stations at a cost of £27,500, for which purpose application is to be made for consent to a loan.

Hove.—Loan.—The Town Council is applying for sanction to a loan of £95,088 for electricity purposes.

Liverpool.—Loans.—Application is being made by the Electricity Committee for sanction to the borrowing of the following amounts:—Sub-stations: Buildings, £15,800; transformers switchgear, &c., £27,600. Lister Drive power station: Transformers, switchgear, &c., £69,200. Static sub-stations: Buildings, £80,000; plant, £150,000. Purchase of coal wagons £15,000. H.p. and l.p. mains, £300,000.

Electricity Extensions.—The following extensions are to be carried out:—Supply from Queen's Drive sub-station to Derby Lane area: L.p. mains, £3,855; h.p. mains, £6,214 a.c. mains, £4,370. Extension of mains to Woolton district £3,070. Sub-station at Hightown, and l.p. mains to be laid at an estimated cost of £2,180.

London.—Woolwich.—The Town Council has decided to lay a main transmission line in duplicate from Globe Lane to the Eltham sub-station at an estimated cost of £37,000, plus about £3 000 for switchgear.

Fulham.—The Finance Committee has recommended to the Borough Council that application be made for sanction to the borrowing of £1,800 for the erection of a combined gatehouse and sub-station at the entrance to the electricity works, and £2,000 for the provision of sub-station plant and equipment.

Parliamentary Bill.—The *Financial News* reports that the London and Home Counties Joint Electricity Authority is introducing a new Bill into Parliament for power to erect a generating station at Dukes Meadows, Chiswick, the construction of railways, docks, and other works, and the acquis

tion of land. Provision will be made for entering into agreements with Chiswick Urban District Council and others, and for power to abstract water from the Thames, &c. The Examiners of Private Bills found that the measure deposited at the end of last year failed in several particulars to comply with the Standing Orders of Parliament.

Maidenhead.—Electricity in Small Houses.—The Town Council has decided to supply electricity for cooking and lighting to the new housing site in Cox Green Road under a two-part tariff, consisting of a fixed charge of 1s. 8d. per week, plus 1½d. per kWh for electricity consumed. If the Housing Committee pays a preliminary amount of £5 per house on account of wiring, &c., the fixed charge will be reduced to 1s. 5½d. per week.

Peterborough.—Electricity Charges.—The Town Council has decided to offer an alternative tariff to consumers of electricity for domestic purposes of 12½ per cent. on the ratable value or assessment, plus £1 per annum service charge, and 1d. per kWh for electricity consumed.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Whitby.—Lighting: 8d. per kWh. Heating: 1½d. per kWh. Power: First 50 kWh per quarter, 6d. per kWh; next 950 kW, 3d. per kWh; beyond, 2d. per kWh.

Dover.—The 5 per cent. increase made owing to the coal dispute has been withdrawn.

Colchester.—The temporary increase of 25 per cent. is to be discontinued.

Conway.—Lighting: From 7d. to 6d. per kWh.

Leicester.—The temporary increase in charges of 10 per cent. is to be discontinued.

Weymouth.—Lighting: From 8d. to 7d. per kWh. Heating and power: From 2½d. to 2d. per kWh. Cooking and contract: From 2d. to 1½d. per kWh. Public lighting: From 4d. to 3½d. per kWh.

Portsmouth.—A reduction of ½d. per kWh under the following tariffs:—Domestic; business premises, &c. (maximum demand); power; and heating and cooking not taken under the domestic tariff. Lighting under the alternative flat rate: A reduction of 1d. per kWh.

Douglas (Isle of Man).—Lighting: From 8d. to 7d. per kWh. Power: From 2½d. to 2d. per kWh. Cooking: From 1½d. to 1¼d. per kWh.

Carmarthen.—*The Carmarthen Electric Supply Co., Ltd.*—Heating and cooking: 1½d. per kWh flat rate all the year round.

South Africa.—Wellington.—According to the *South African Engineer* the Municipal Council for some time past has been hard pressed to maintain a supply of electricity, but negotiations have now been concluded whereby the Electricity Supply Commission will give a supply of electrical energy from its Capetown undertaking, through an extension of the 33,000-V transmission line which has been erected as far as Huguenot. The supply is required urgently, and pending completion of the Commission's generating station at Salt River, it will be given from the Capetown Corporation's power station in Dock Road.

Southport.—Assisted Wiring Scheme.—The Corporation Electricity Committee has prepared an assisted wiring scheme intended to apply to old properties where gas is used. The scheme, which is not to apply to new houses, provides that such installations are to have a maximum of 12 lighting points, and are to be carried out by local electrical contractors, who must either be registered or members of the Electrical Contractors' Association. The proposals were submitted to a recent meeting of the Town Council, and, after discussion, referred back.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the following authorities:—The Burford Electric Light and Power Co., Ltd., to supply electricity in certain parishes in the rural district of Witney; the Oswestry Electric Lighting and Power Co., Ltd., to extend its area of electricity supply so as to include the parishes of Selattyn, Oswestry Rural, and Whittington; Weymouth Corporation, to supply in the rural district of Weymouth, the urban district of Portland and certain parts of the rural districts of Dorchester, and Wareham and Purbeck; the West Cornwall Electricity Supply Co., Ltd., to supply electricity in the urban districts of St. Just, Madron, Paul, Ludgvan, Hayle, Phillack, Padstow, and Wadebridge, and the rural districts of West Penwith, Redruth, Helston, East Kerrier, Truro, and St. Columb Major.

The Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them authorising the Darlington Corporation to supply electricity in parts of the rural districts of Darlington and Croft.

Stockton-on-Tees.—Loan.—The borough electrical engineer has recommended that application be made for a further loan of £10,000 for mains and services.

Stoke-on-Trent.—Conference of Committees.—The Corporation has asked the chairmen and vice-chairmen of the Housing, Gas and Electricity Committees to confer on the question of the supply of gas and electricity to housing estates with a view to saving expenditure on the provision of duplicate systems of pipes and cables.

Torpoint.—Electricity Supply.—The Urban District Council has rejected the offers made by the Torpoint Electricity Supply Co., Ltd., and is to proceed with its own application for an electricity Order.

Torquay.—Loans.—The Town Council has received sanction to a loan of £12,500 for mains and services, and has applied for sanction to a further loan of £8,199, being the estimated expenditure on the first section of additional h.p. mains, and £2,500 for transformers and switchgear for the main substation in Upton Valley.

Tunbridge Wells.—Loan.—The Town Council has applied for sanction to a loan of £28,395 for electricity purposes.

Price Reduction.—A reduction of ¼d. per kWh has been made to consumers on the ratable value and room basis systems of charges, making the price 1d. per kWh in the borough, and 1¼d. outside the borough.

Walton-on-Thames. — Purchase of Undertaking.—The Urban District Council has received sanction to the purchase of the local electricity undertaking of the Urban Electric Supply Co., Ltd., and has received permission to borrow £90,000 for the purpose.

Watford.—Loans Sanctioned.—The Town Council has received sanction to loans of £5,000 for transformers and switchgear, £2,500 for meters, and £30,000 for mains and services.

Tramway and Railway Notes.

Australia.—Railway Electrification.—It is anticipated that the electrification of the Milson's Point to Hornsby line, New South Wales railways, will be completed about the middle of this year, after which conversion of the main suburban line will commence.

Brazil.—Railway Improvements.—Tenders are being considered for improvements to the Sorocabana Railway, owned by the State of Sao Paulo, leased to the Sorocabana Co. and controlled by the Brazilian Railway Co. The scheme includes the laying of 140 km. of double track, the electrification of over 100 km. of line, and the erection of a new passenger station at Sao Paulo, at an estimated cost of 11,000 to 11,500 contos of reis.—*Reuter's Trade Service* (Sao Paulo).

Continental.—Switzerland.—Work is progressing on the Federal railways, and with the completion of the fourth power station at Vernayaz (Simplon district) additional supplies of electrical energy will be placed at the disposal of the State. It is estimated that Vernayaz will have an output of over 100,000 h.p.

France.—It is reported that the whole suburban line from Paris to St. Germain will be electrically operated as from March 20th. Express trains will cover the distance (21 km.) in 27 minutes instead of 50 minutes as at present. On March 2nd an electric train, made up of four coaches, was tested on the section from Rueil to St. Germain. The trial was satisfactory, particularly in the St. Germain tunnel, where the gradient is a steep one.

In the course of a recent paper read before the French Society for the Encouragement of National Industry on "The Practical Application of Wireless Telephony," Commandant L. Julien mentioned that experiments had been made by the Paris Tramways Co. with one of its tower wagons used for repairing overhead conductors fitted with wireless apparatus so that those in charge of the vehicle could be communicated with while out at work. The tests had been made on a wavelength of 100 metres and a power of 100 watts, and had proved quite successful within a certain range. In order, however, to enable communication to be established with the most distant sections of the tramway system, it would be necessary to increase the power to 250 watts.

Croydon.—Abandonment of Route.—The *Daily Telegraph* reports that the Borough Council, on March 7th, confirmed its decision of January 24th to close down the Addiscombe section of the tramway on March 31st. The motion was carried by 30 votes to 18, after the Council had heard a deputation which presented a petition of protest signed by over 5,000 residents. The Council also resolved to accept the London General Omnibus Company's offer of a service of 'buses in lieu of trams between Croydon High Street and Woodside railway station. The deficiency on the whole of the tramway undertaking for the year ending this month was reported to be £66,000, and the estimated deficiency for the coming year was given as £70,000.

Glasgow.—Tramway Extension.—The Corporation Tramways Committee is to consider the extension of the tramway on the London Road beyond Auchenshuggle when the bridge widening at Mount Vernon is completed.

London.—Tramcar Improvements.—The Highways Committee of the L.C.C. has recommended the expenditure of £54,000 for the provision of rearranged seating and other improvements on 250 tramcars.

Tube Station Site.—The Underground Railway Co. has bought a site for a station at Arnos Grove, Palmer's Green. Lord Ashfield, in a letter to the secretary of the Middlesex Federation of Ratepayers' Associations, states that the reason for the purchase at the present time is the development which is about to be started on the Arnos Grove estate, and which might result in the land becoming more costly to acquire at a later date, when it might be required in connection with the extension of the London Electric Railways northwards from Finsbury Park.

Southern Railway.—New Line.—There is a good prospect of a start being made in the near future with the construction of the Wimbledon and Sutton Railway. Authorisation for the work was obtained in 1910, but from time to time it has been delayed for various reasons. Under its existing statutory powers the Southern Railway Co. is required to complete the railway not later than July, 1928, but it is promoting a Bill in Parliament which includes a clause extending that period. According to *The Times*, the company has intimated to the Wimbledon Town Council that it contemplates beginning the construction of the railway in the early part of next year, and of completing the work within two years from the start. Negotiations are being pushed forward for the acquisition of the necessary land. In view of this, the Wimbledon Corporation has refrained from petitioning against the Bill.

Telegraph and Telephone Notes.

"Beam" Radio-telegraphy.—Australian Service Tests.—A report issued by Marconi's Wireless Telegraph Co. states that the short-wave wireless "beam" stations which have been built for the British Post Office by the Company, at Grimsby and Skegness, for communication with Australia, have successfully passed their official seven-days' test, and the Company has been informed by the General Post Office that they have more than fulfilled the conditions required by the contract.

Bulgaria.—New Radio Station.—Four well-known European firms (two German, one French, and one British) have tendered for the construction and equipment of a wireless telegraph and telephone station at Sofia to cost about 30,000,000 leva, a sum greatly exceeded by many of the tenders. The German firm of Lorenz (Berlin) made two offers, one for a station costing 95,000,000 leva, and the other for a station costing 42,000,000 leva. The Telefunken firm (Berlin) also submitted two tenders, one at 54,000,000 leva and the other at 50,000,000 leva. The Marconi concern (London) submitted two tenders, one at 60,000,000 leva and the other at 40,500,000 leva; and the French concern (Telephones Sans Fil) submitted three, the first at 30,950,000 leva, the second at 32,200,000 leva, and the third at 29,000,000 leva. The offers are being considered, and a decision is expected shortly.—*Reuter's Trade Service* (Sofia).

Cape Verde Islands.—Radio-Telegraph Service.—Marconi's Wireless Telegraph Co., Ltd., announces the inauguration of a telegraph service from London to the Cape Verde Islands. Telegrams for transmission to the Islands will be accepted marked "*via* Marconi" at any Marconi office, or at any railway, or postal telegraph, office in Great Britain and Ireland. The ordinary rate per word is 2s. 3d. to St. Vincent and 3s. 1d. to St. Thiago; the deferred rate is half, and the urgent rate triple, these amounts.

New Zealand.—Telegraph and Telephone Service.—The capital expended during the year ended March 31st, 1926, on improving the telegraph facilities in New Zealand to meet the standard of modern requirements, and on extending the telephone exchanges to provide for additional business, amounted to £931,661. The telegraph and telephone revenue showed an increase of £146,642 over that of 1924-25—the previous best year in the history of the telegraph and telephone service. Pole-line and wire work carried out during the year represented the erection of 1,776 miles of pole-line and 15 640 miles of open aerial wire; in addition, 270 miles of lead-covered cable were laid for subscribers' circuits, containing 73,700 miles of wire. As a result of special efforts made during the year to overtake the arrears of telephone subscribers' services, a new record was established for new connections, the total for the year (13,368) being 64 in excess of the number connected during any previous year.

The Telephone Service.—Comparative Progress.—In reply to a recent question in the House of Commons, the Postmaster-General gave the following figures as representative of the number of telephones in use per 1,000 of population in the countries named on December 31st, 1925:—Great Britain (including Northern Ireland), 31; United States of America, 150; Canada, 130; Denmark, 95; New Zealand, 94; Sweden, 72; Australia, 68; Norway, 66; Switzerland, 50; Germany, 43; Netherlands, 30; Austria, 23; Belgium, 22; Argentina, 19; France, 18; Japan, 10. No later figures for those countries were available, he said, but the figure for Great Britain on January 31st, 1927, was 33.

Transatlantic Telephony.—Cuba-England Service.—A telephone service between Cuba and England was inaugurated on March 11th by Dr. Martinez Ortiz, Cuban Secretary of State, who talked direct to the British Foreign Office with Mr. Locker Lampson, Under Secretary of State, and the Cuban Minister in London. The charges will be 87 dollars for the first three minutes and 29 dollars for each additional minute.—*Reuter* (Havana).

Running Cost.—In reply to a question in the House of Commons, Sir W. Mitchell-Thomson, Postmaster-General, said that for the period January 7th to 31st the running costs of the British end of the Transatlantic telephone service, including sundry expenses incidental to the initiation of the service, amounted to approximately £2,000; and plant charges, depreciation and interest, to a further £1,900. It was expected that the service would be self-supporting.

New Receiving Station.—The G.P.O. staff at Kemback (Cupar, Fife) has made rapid progress with the erection of power house, receiving room, and antenna system, and by next month it is expected the new station will be ready to receive wireless telephony from America, which will be transmitted by underground cable direct from Kemback to London. The aerial consists of three parallel wires, carried on telegraph poles, three and a quarter miles in length and two miles apart. It is perfectly directional, being in correct line with the American sending station. British and American receiving panels are being erected and 12 valves will be used on each set. A staff of 12 men will be employed, four being on each watch.

Radio Notes.

Dominican Republic.—Service Restarted.—Towards the middle of March broadcasting was to recommence in the Dominican Republic under the auspices of the Radio-telegraphic Service, from station H-1-one-C, installed by the Radio Club of Santo Domingo.—*Reuter's Trade Service* (Port-au-Prince).

Licences.—Last Year's Figures.—It was recently announced officially that the number of broadcast wireless receiving licences issued in 1926 totalled 2,178,000, as compared with 1,642,000 in 1925. The total receipts amounted to £1,089,000 during 1926, against £821,000 in 1925.

North Wales.—Relay Station.—The Corporation of Bangor, after discussing the proposal for the establishment of a broadcasting relay station in North Wales, has decided to make formal application for the station to be located in that town.

South Africa.—New Company.—It is understood that negotiations have been concluded for the formation of a South African broadcasting company to take over the Johannesburg area. A share preference will be given to listeners, who will receive the first 10 per cent. of profits, the Government sharing the remainder with them and using its position to reduce costs, says the *Daily Mail*. The company's licensing conditions provide for the erection of a powerful station within nine months. The Government is to appoint two directors and the Radio Society one. To check piracy, the sale of wireless set parts to non-licence holders will be prohibited. The Government retains the right to take over the service after five years.

Turkey.—First Station.—Turkey has the distinction of having installed the first broadcasting station of the Near East. It is located at Stamboul and began operations last month, says *World Radio*, and it is anticipated that a second station will be working at Angora in a year's time. It was constructed by the Compagnie Générale de Télégraphie Sans Fil, Paris, with a power of 6 kW. The station is actually situated in Osmanie, but the studio is in the G.P.O., Stamboul, nine miles of cable linking it to the transmitter. Turkey's population is about 14 millions.

United States.—Underground Transmission.—Station WRNY, in New York City, is preparing to broadcast on a short wave below fifty metres, simultaneously with the regular broadcast on 375 metres. In addition, with the co-operation of Prof. James H. Rogers, the station will shortly go "on the air" with a buried aerial. As soon as the weather permits, says *World Radio*, a terra-cotta pipe, through which the aerial will be drawn, will be buried about 6 ft. under ground at Coytesville, N.J., where the transmitter is located. During the war extreme ranges were obtained by underground transmission, and WRNY will be the first station in America to broadcast on such an underground aerial.

A report issued at Washington, D.C., by the United States Department of Commerce, says that there are 164 broadcasting stations in Europe, over 700 in the United States, 85 in the remainder of North America, 38 in South America, 16 in Asia, 28 in Oceania, and 9 in Africa.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the ELECTRICAL REVIEW containing the advertisement is given in parentheses below.

Contracts Open.

Adwick-le-Street.—March 21st. Urban District Council. Cables, boxes, pillars, and necessary materials and apparatus for a distribution network scheme. (March 4th.)

Australia.—MELBOURNE.—April 26th. Postmaster-General's Department. Telephone switches. (B.X. 3254.)* Instrument cords. (B.X. 3255.)*

April 12th. Cord-type switchboards. (B.X. 3280.)*

May 10th. Telephone relays. (B.X. 3333.)*

May 17th. Resistances and reactances. (B.X. 3307.)*

May 23rd. State Electricity Commission. Switchgear and accessories. (B.X. 3285.)*

May 9th. 6,600-V transformers and spares. (B.X. 3331.)*

SYDNEY.—May 9th. Electricity Department. Suction auxiliary switchgear. (B.X. 3338.)*

Ayr.—March 23rd. Ayrshire Education Authority. Electric lighting and central heating of new primary school at Irvine. Plans with Master of Works, Education Offices.

Beckenham.—April 4th. Electricity Department. Three e.h.p. transformer sub-station switchboards. (See this issue.)

Bristol.—April 11th. Electricity Department. 39 miles (approx.) 3-core, paper-insulated cable. (See this issue.)

Dundee.—Cleansing Department. Electric lighting installation for the Department's premises at Broughty Ferry. Mr. George Baxter, city engineer, 91, Commercial Street, Dundee.

Edinburgh. — March 21st. Electricity Department. Twelve months' supply of cables, box frames and covers, house service fuse boxes and fuseboards, meters and meter boards. (March 4th.)

Erith.—March 24th. Electricity Department. H.p. and l.p. underground cables, joint boxes, &c. (See this issue.)

Halifax.—March 22nd. Board of Guardians. Electrical fittings for six months. Mr. A. T. Longbotham, clerk, Carlton Street.

Hazel Grove and Bramhall.—March 23rd. Urban District Council. One oil circuit breaker and kiosk and seven 20-kW transformers and kiosks, cables and two e.h.p. sub-station switchgear panels. (March 4th.)

Ilford. — March 22nd. One 500-kW rotary convertor, with transformer, switchgear, &c. (March 4th.)

India.—March 22nd. India Store Department. Two 250-kW Diesel-engine alternator sets, with switchgear, transformer, &c. (February 18th.) 30,000 oil insulators. (March 4th.)

Kettering.—March 23rd. Electricity Department. E.h.p. and l.p. armoured cables and one 1,000-kVA transformer. (March 4th.)

Kilmarnock.—April 6th. Ayrshire Electricity Board. Two water-tube boilers, with superheaters, economisers, air heaters, mechanical stokers, and coal-handling plant. (See this issue.)

London.—HOLBORN.—April 13th. Board of Guardians. Electric lighting installation at the London Road, Mitcham, schools. (See this issue.)

SHOREDITCH.—March 22nd. Board of Guardians. Electric ovens, fish fryer, and griller. Mr. J. C. Clay, clerk, 213, Kingsland Road, E.2.

LONDON COUNTY COUNCIL.—March 29th. Electric lighting installation for Sudbourne Road elementary school, Brixton, S.W. (approx. 136 points). (See this issue.)

Manchester.—March 22nd. Tramways Department. Copper bonds. Mr. H. Mattinson, general manager, 55, Piccadilly, Manchester.

March 22nd. Board of Guardians. Electric main cable required at Styal Cottage Homes, Styal. Mr. E. Hargreaves, Superintendent of Works, Union Offices, All Saints.

New Zealand. — WELLINGTON.—May 31st. Public Works Department. 50-kVA transformers for the Waikaremoana electric power scheme. (B.X. 3294.)* 50-kVA transformer for Arapuni scheme. (B.X. 3293.)*

April 5th. 500-kVA transformers for the Lake Coleridge power scheme. (B.X. 3343.)*

June 7th. Railway sub-station equipment, Lake Coleridge electric power scheme. (B.X. 3295.)*

May 4th. General Post Office, Stores Division. Sub-station protectors. (B.X. 3286.)*

June 13th. New Zealand Railways. Machine tools, workshop equipment and overhead electric travelling cranes. (A.X. 4344.)*

June 6th. Six electric locomotives. (A.X. 4355.)* Overhead equipment for the Christchurch-Lyttelton electrification scheme. (B.X. 3301.)*

Oldham.—March 26th. Electricity Department. One 80-ton electric travelling crane. (March 4th.)

Plympton St. Mary.—March 31st. Urban District Council. H.p. cables, underground and overhead mains, h.p. and l.p. switchgear, transformers and transformer kiosks. (March 11th.)

Rathmines and Rathgar.—March 26th. Urban District Council. Electrical supplies, including lamps, meters, fuse boxes, copper wire, engine-room stores. Forms of tender from the Electricity Works.

Rhondda.—March 26th. Electricity Department. Twelve months' supply a.c. ordinary and prepayment meters, mains and house service material. (February 25th.)

Rochdale.—March 21st. Electric lighting installation, Bamford Workmen's Club. Particulars from the Secretary.

Roumania.—BUKAREST.—April 2nd. 600,000 porcelain insulators. (B.X. 3314.)*

Sheffield.—New Century Pictures, Ltd. Electric lighting installation at the Albert Hall, Sheffield. Particulars from Messrs. Chadwick, Watson & Co., 9, Albion Street, Leeds.

South Africa.—JOHANNESBURG.—April 8th. Municipal Council. Ironclad cut-outs. (B.X. 3332.)*

DURBAN, NATAL.—March 28th. Corporation. 9½ miles 6,600-V cable, 17 miles combined pilot and telephone cable. (See this issue.)

Southend-on-Sea.—April 9th. Light Railways and Electricity Department. Remote-controlled rotary convertors. (March 11th.)

Walthamstow.—March 23rd. Electricity Department. L.p. cables and v.i.r. wires for 12 months. (March 11th.)

* Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Belgium.—Belgian, German, French, Czecho-Slovakian, Dutch and British (British Insulated Cables, Ltd.) companies competed early last week for an armoured cable contract for the municipal authorities of Saint Gilles, Brussels. The lowest offer was that of a Belgian concern.

East Ham.—Cleansing Committee. Recommended:—
New battery for electric vehicle (£219).—Chloride Electrical Storage Co., Ltd.

Eastbourne.—Electricity Committee.
Coal handling plant—

W. J. Jenkins & Co., Ltd. (Accepted.) ...	**£1,144**
New Conveyor Co.	1,415
Naylor Bros., Ltd.	1,528
Mitchell Conveyor Co.	1,565
Babcock & Wilcox, Ltd.	1,754
Ed. Bennis & Co., Ltd.	1,795

Hull.—Electricity Committee. Accepted:—
Electrical equipment for two electric houses on the Cottingham Housing Estate (£152).—W. L. Harrison, Ltd.
Telephones Committee. Accepted:—
Cable (£897).—W. F. Dennis & Co.

India.—BOMBAY.—Corporation. Accepted:—
Re-wiring municipal head office building (Rs.11,775).—Sterling Electric Works.

Leeds.—Tramways Committee. Accepted:—
200 yd. manganese steel guard rail (£360).—Edgar Allen and Co., Ltd.

London.—ADMIRALTY. Accepted:—
Resistance rod.—Edison Swan Electric Co., Ltd.

ISLINGTON.—Borough Council.—The contract for electric lamps for 12 months has been placed with the Milton Electrical Co., Ltd.; Edison Swan Electric Co., Ltd., has received the contract for electric lamp globes.

Shoreditch.—Lighting Committee. Recommended:—
Cable (£6,118).—W. T. Glover & Co., Ltd.
1,500-kW remote-controlled automatic converting plant and switchgear (£9,453).—Hewittic Electric Co., Ltd.
E.h.p. switchgear equipment for Whitton Street (£3,152).—British Thomson-Houston Co., Ltd.

Tilbury.—Urban Council. Accepted:—
Switchgear and transformers (£1,870).—Metropolitan-Vickers Electrical Co., Ltd.
Sub-stations and mains (£35,547).—Watshams, Ltd.

Weymouth.—Electricity Committee. Accepted:—
Supply and laying cables at housing estates (£2,176).—Johnson & Phillips, Ltd.

Forthcoming Events.

British Electrical Development Association.—Friday, March 18th. Royal Society of Arts, W.C.2. 7.30 p.m. "Refrigeration." Mr. N. E. Barber.

Association of Mining Electrical Engineers (North of England Branch).—Saturday, March 19th. Newcastle. 3 p.m. "Standardisation of Colliery Electrical Requisites." Mr. C. D. le Maistre.

Institution of Electrical Engineers.—Informal Meeting.—Monday, March 21st. 7 p.m. "Domestic Electrical Refrigeration." Mr. R. J. Mitchell.

(Mersey and North Wales (Liverpool) Centre).—Monday, March 21st. University, Liverpool. 7 p.m. "Illuminating Engineering," Mr. J. W. T. Walsh; and "Problems of Public Lighting by Electricity," Mr. H. T. Harrison.

(North-Midland Centre).—Tuesday, March 22nd. Hotel Metropole, Leeds. 7 p.m. Ordinary meeting.

(North-Western Centre).—Tuesday, March 22nd. Engineers' Club, Manchester. 7 p.m. "Notes on the 60,000-V Underground Network of the Union d'Electricité." Col. E. Mercier.

(East-Midland Sub-Centre).—Tuesday, March 22nd. Technical College, Derby. 6.45 p.m. "Powdered Fuel." Mr. G. H. Lake.

(Tees-Side Sub-Centre).—Monday, March 21st. Cleveland Technical Institute, Middlesbrough. 7 p.m. Ordinary meeting.

(South-Midland Students' Section).—Friday, March 18th. Annual joint meeting of the Graduates' and Students' Sections of the Institutions of Civil, Mechanical, and Electrical Engineers. Discussion: "That the Centralisation of Public Services is Desirable."

(Scottish Students' Section).—Wednesday, March 23rd. Royal Technical College, Glasgow. 7.30 p.m. Ordinary meeting.

(London Students' Section).—Friday, March 18th. Imperial Hotel, Russell Square, W.C. 7.15 for 7.30 p.m. Annual dinner.

Friday, March 25th. London. 6.15 p.m. "Electricity in the Works Laboratory." Mr. R. E. Snoxell.

Royal Society of Arts.—Monday, March 21st. 8 p.m. Cantor lecture. "Some Industrial Applications of Electrothermics." Mr. G. I. Finch.

Batti-Wallahs' Society.—Tuesday, March 22nd. Hotel Cecil. Annual dinner and dance.

Illuminating Engineering Society.—Tuesday, March 22nd. Lighting Service Bureau. 6.30 p.m. Discussion on "Problems in Illumination and Practical Solutions."

Royal Institution.—Tuesday, March 22nd. 5.15 p.m. "X-Rays and the Chemical Molecule." Dr. G. Shearer.
Saturday, March 26th. 3 p.m. "Alpha Rays and Atomic Structure." Sir Ernest Rutherford.

Institute of Wireless Technology.—Wednesday, March 23rd. Engineers' Club. 7 p.m. "Methods of Approximating the Reception Factor," by Mr. E. H. Turle.

Meter Engineers' Technical Association.—Thursday, March 24th. Lighting Service Bureau. 7 p.m. Annual general meeting. Discussion on "Queries and Problems."

Electrical Association for Women (South Wales and Monmouthshire Branch).—Thursday, March 24th. City Hall, Cardiff. 6.30 p.m. Inaugural meeting.

Birmingham Electric Club.—Friday, March 25th. Grand Hotel. 7 p.m. "Electricity Supply in the Midland Area." Mr. S. T. Allen.

North-East Coast Institution of Engineers and Shipbuilders.—Friday, March 25th. Newcastle-on-Tyne. 6 p.m. "Pure Science." Sir Richard Glazebrook, F.R.S.

Physical Society.—Friday, March 25th. Imperial College of Science. 5 p.m. Ordinary meeting.

Electricity Supply Commercial Association (Great London Division).—Saturday, March 26th. Poland Rehearsal Rooms. 7.45 p.m. Dance.

Electrical Power Engineers' Association (Northern Division).—Saturday, March 26th. Midland Hotel, Manchester. 5.30 for 6 p.m. Annual dinner.

Notes.

Another X-Ray Martyr.

The *Daily Telegraph* reports that Dr. Dawson Turner, who was for twenty-nine years X-ray and radium expert at the Royal Infirmary, Edinburgh, and who is now living in retirement near Godalming, Surrey, has lost another finger owing to X-ray dermatitis. Early in his career Dr. Dawson Turner sustained severe burns, which eventually led to one of the fingers on his right hand being amputated. He is the inventor of a special tube which has added considerably to the efficiency of X-ray apparatus.

A Diesel-Electric Ship.

Scott's Shipbuilding and Engineering Co., Ltd., Greenock, has received from American owners an order for the hull of an oil-tank vessel of 12,500 tons, which will be propelled by Diesel-electric machinery. The electrical installation through which the power will be transmitted to the propellers will be provided by the British Thomson-Houston Co., Ltd., of Rugby, and all the machinery will be fitted on board at Greenock by the builders of the hull. The vessel will be the first constructed on the Clyde for propulsion by machinery of this type.

An Electric Sign Paradise.

According to Mr. Arthur Williams, of the New York Edison Company, in New York City's "Great White Way" there are 1,243,538 lamps in electric signs alone, aggregating 25,000,000 candle-power. More than 7,000 additional signs, containing 125,000 lamps, have been added to the skyline of Manhattan during the past two years. There are now 19,000 electric signs in use on Manhattan Island, south of 135th Street alone.

Electrical Aids in Fire Fighting.

A fire escape carrying, among other new features, a telephone, has been designed by Supt. Neal, of the Leicester Fire Brigade, and has been adopted by one of the principal firms supplying fire equipment. The escape has a ladder 85 feet long, to which, in addition to a pump working independently of any other machine (in itself a novelty), there is attached the telephone and a searchlight. The latter will enable firemen to see the character and quantity of the contents of any portion of a burning building that is not already involved. The telephone will be used for communicating with the firemen at the top of the escape during a fire. This is done at present by shouting, or by sending a messenger up and down the ladder. The first escape of the new pattern will probably be supplied to the Leicester Fire Brigade.

Testing Mining Gear.

Members of the Mining Institute of Scotland visited the Mile End works of Messrs. Mavor & Coulson, Ltd., Glasgow, on March 2nd, when special testing apparatus for ensuring that electrical mining gear will not endanger the safety of gas-infested underground workings was inspected. Formerly the gear manufactured by Messrs. Mavor & Coulson was sent to the Sheffield testing station, which is staffed by the University. Recently, however, the firm began experiments with apparatus to carry out safety tests in the works, and a satisfactory system has been evolved which enables them, as part of the routine, to test practically all their mining manufactures. The process consists of filling with a highly explosive gas mixture the explosion cover of the plant to be tested, and placing it in a sealed chamber flooded with an easily ignited gas mixture. The mixture under the cover is then electrically fired: if the cover is perfect it withstands the resulting explosion; if it is not, the surrounding explosive in the sealed chamber is ignited. In the event of the first explosion inside the cover not being followed by an explosion in the chamber, the gas mixture in the chamber is fired to ensure that its failure to explode was not due to its own composition. This ensures not only that the first test is sound, but also that the explosion cover of the plant is able to withstand explosion pressures outside as well as inside.

The visitors also saw demonstrations of new models of coal cutters and coal-conveyors manufactured by the firm. One of these models is a shaker conveyor, the height of which is only 16 inches, thus enabling it to be operated easily in a minimum seam of 18 inches.

Transmission Line Regulation.

The Westinghouse Electric Co., U.S.A., announces the acquisition of patents covering an invention by a San Francisco electric engineer, Mr. Frank Baum, by which he hopes to make possible the transmission of electric power over distances of 500 to 1,000 miles from the main power sources without the development of erratic voltage conditions. At a cost not exceeding 20 per cent. above the original outlay it is estimated that the capacity of any long line can be increased 75 per cent. According to *The Times*, Mr. Baum's invention provides for the "connection of a plurality of automatically regulated synchronous condensers at uniformly spaced distances to high-voltage transmission lines," thereby converting a long line into a series of short lines, in each of which the factors causing voltage instability can be corrected, for example, by auxiliary power from steam plant.

Fatality.

Leading-Aircraftman Dobbs, of the Royal Air Force, whilst carrying out the first test of "balloon-jumping" in this country near the Stag Lane Aerodrome, Hendon, came in contact with an overhead electric wire and received a fatal electric shock.

Electric Vehicles in the United States.

An electric truck handbook for 1927, with route maps, ferry time-tables, and other useful hints for owners and operators of electric trucks and commercial transportation men generally, has been issued by the Automobile Bureau of the New York Edison Company. This book makes it an easy matter for operators to ascertain the nearest electric truck garage in the New York Metropolitan District, and, besides full instructions covering the charging of truck batteries, contains much necessary information in a condensed form, including tables of charging rates for storage batteries and typical monthly garage rates in New York City, as well as lists of manufacturers. It is distributed by the Edison Company, free of charge. A similar publication would be useful in this country.

Lighting Unit Tests.

The correct design of the bowl or globe for enclosed lighting units is of supreme importance for obtaining the required diffusion and distribution of light, and in this connection a series of tests recently carried out by the Illuminating Engineering Department of the Edison Swan Electric Co., Ltd., is of particular interest. The tests were undertaken with the object of determining the distribution of light from the firm's "Swanlite" enclosed glassware units; the results of the tests are illustrated in graph form in fig. 1. Two fittings, each equipped with 200-W gasfilled lamps were mounted at a height of 9 ft. above the working plane; the spacing between units was 12 ft., and the intensity of light from each was measured at distances of 1 ft. from points immediately under them. The respective curves are illustrated at A and B, showing that in each case the maximum and minimum intensities were 5 and 1.25 foot-candles; the resultant illumination of the two units is indicated by curve C, which, had the fittings been spaced 11 ft. apart, would have been a straight line. Fig. 2 shows the "Swanlite" fitting, which is of the flat type, specially designed for the illumination of shops and stores where goods are displayed on counters and shelves.

A Skysign Rhapsody.

Marinetti, the Italian artist-poet and apostle of Futurism, who has the Shavian gift of shaking people out of conventional ruts and shocking them into thinking twice, has burst into rhapsodies on the triumph of electric light over the powers of darkness. In an open letter to Mussolini, he pleads that skysigns be not abolished from the great square that lies at the bases of the majestic buttresses of the Cathedral of Milan. Marinetti's prose loses its clanging precision in translation, but here is the sense of his panegyric to brilliant light:—

Traditional Critics of the Traditional Schools really think that the æsthetic qualities of the Piazza del Duomo di Milano will be safeguarded by abolishing illuminated signs! Ignoring the preoccupation of certain believers who know how to pray only in darkness and who do not see God in the divine electric light that to-day reigns in all the churches of Europe, I come forward to proclaim that illuminated signs in general, and those of the Piazza del Duomo in particular, constitute indispensable beauty.

No need for Futurist genius to see in illuminated signs our ardent evening prayer to the sun that it may soon return to warm the life of the world!

Illuminated signs are the sane sober optimism that one obstinately opposes to the desperation of gloom.

Illuminated signs are the gay flowers, the ripe fruits, the dancing nymphs of the new Futuristic æsthetics of speedy ferro- and bold concrete.

Illuminated signs are hygienic salvation. They are the denigration of sickly twilight, of nostalgic moonlight, and of the bars full of depressing melancholy.

They are our artificial constellations, daughters of our implacable will: lively, portable constellations to console us for those beyond our reach.

Illuminated signs are the profound scientific, industrial and commercial dynamism of the city—displayed on the rooftops to rival the dynamism of the stars.

Beautiful with a new but secure beauty, they answer the noblest and most crying of our needs—the curtailment of our submission to the half-death of dreams and night.

A Brazilian Development.

The Brazilian newspapers announce that the Cia. Brasileira de Energia Electrica, of Rio de Janeiro, which supplies electricity for light and power to the town of Bahia and the surrounding district, intends greatly to enlarge its power station in Bananeiras on the Paraguassú. A sum of £750,000 is mentioned as the expenditure on these extensions, which would apparently entail the doubling of the present capital of the company. When the additional plant is installed, there will be eight turbines in operation instead of three as at present, each machine being of 5,200 h.p. capacity. With the completion of this scheme, the lighting system of the town can be developed, more power can be placed at the disposal of the tramways and local industries, while extensions of the telephone installation, both local and trunk, are also contemplated.

B.E.S.A. Publication.

The British Engineering Standards Association has recently issued an addition to the B.S.S. for Insulated Annealed Copper Conductors for Electric Power and Light (No. 7-1926). This consists of data relative to a twin flexible cord, the conductors of which are insulated with pure and vulcanised india-rubber, twisted together and sheathed overall with tough-rubber compound. This flexible cord is intended for use only with pendant electric light fittings on voltages up to 250 V. The flexible is new only in the sense that it is provided with a coating of cab-tire sheathing. The details are given on an addendum slip which will be issued with all copies of specification No. 7-1926 sold in future. Those already in possession of the specification can obtain a copy of the slip free of charge by sending a stamped envelope to the Publications Department, British Engineering Standards Association, 28, Victoria Street, London, S.W.1.

The George Montefiore Prize.

The triennial international prize competition of the "Fondation George Montefiore" for 1926 has had to be postponed until this year; the prize amounts to 20,500 fr., and is awarded for the best original work submitted on the scientific progress and the technical applications of electricity in all its branches. Essays must be in French or English. The last date for them to be received is April 30th, 1927. Particulars regarding the conditions to be observed can be obtained from the general secretary, Association des Ingénieurs électriciens sortis de l'Institut électrotechnique Montefiore, 31, Rue Saint Gilles. Liége, Belgium.

Service Notes.

The Air Council has decided to increase the number of prize cadetships offered for competition annually from three to twelve. These cadetships enable boys to complete the two years' course at the R.A.F. Cadet College, Cranwell, at a cost of only £40 in all to their parents. Particulars can be obtained from the Secretary, Air Ministry, London, W.C.2.

Electricity Works in Austria.

From *Elektrotechnik und Maschinenbau*, of Vienna, we have received a copy of the "Statistics of the Austrian Electricity Works and Electric Railways" for 1926, issued by the Elektrotechnische Verein of Vienna in co-operation with the Verband der Elektrizitätswerke—the first to appear after several years' intermission. It is a volume of 214 pages, differing notably from its predecessors. Its contents are divided into five sections, which are respectively an alphabetical index of electricity works; statistics of works of 20-kW capacity and upwards; particulars of the prime movers of all works over 500 kW in size; statistical data of electric railways; and a series of summary tables of data.

From the tables it is seen that the total plant installed has a capacity of 772,770 kW, in 457 stations, nearly the whole of which is a.c., the d.c. plant amounting to 8,160 kW in 98 works; 22 other works, however, supply three-phase and direct current, their aggregate capacity being 37,550 kW. From 322 stations, with 601,800 kW of plant, three-phase only is supplied. Sixteen stations have plant installed in excess of 10,000 kW, totalling 512,400 kW, and 14 fall between 5,000 and 10,000 kW, aggregating 99,770 kW.

The average size of station is 1,700 kW. Most of the power is derived from waterfalls, on which 325 stations depend entirely, with 517,830 h.p.; 61 use water and steam or oil, and 20 use steam alone, aggregating 227,830 h.p.

The supply pressures, output, prices, &c., are given very fully; the pressures appear to be as various as in this country, and several frequencies are in use, but 50 cycles is by far the most common.

The volume is well produced and contains a large amount of information.

A New Dutch Association.

With the object of developing the use of electricity in Holland a new association, known as the Central Electrotechnische Commissie, has recently been formed at Eindhoven. The new body is composed of representatives of the Dutch Association of Electricity Station Managers, the electrical section of the Dutch Metallurgical Association, the Electrobond, the Association of Directors of Electricity Supply Undertakings, the Dutch Association of Electrotechnical Employers and the Dutch Association of Electrotechnical Wholesalers.

Electrical Power in Ports and Harbours.

In a paper under the above title, by Mr. W. A. Perry, recently read before the Institution of Engineers and Shipbuilders in Scotland, the author shows clearly the advantages of electrical over other forms of power for operating the various equipment and conveyances required at the docks for loading and unloading. Naturally, much attention is given to electric cranes, and the various types are dealt with separately, with regard to the duties performed by each. The various methods of supplying travelling cranes are discussed in detail, and the relative merits and disadvantages of each are put forward. The different cabling systems suitable for harbour work are also considered, as well as the motor and control equipment. In supporting the electric crane from the economical point of view, the author estimates the annual running costs for a steam crane, suitable for handling 150,000 tons per year, at £1,340. The costs for an electric crane suitable for the same work he puts at £850.

American Distribution Practice.

Changes in the transmission and distribution system of the Brooklyn Edison Company during the past four years are briefly described in the January issue of the A.I.E.E. *Journal*, mention being made of the effect of the changes on the system's efficiency. In 1927 a low-voltage, a.c. network will be installed and extended to care for the load growth until it becomes the principal supply system for low-voltage energy in Brooklyn. The plan of development is described in detail, the unique features claimed being: First, a suitably designed network unit consisting of a three-phase, 500-kVA. low-loss transformer, with an automatic network circuit-breaker mounted in the low-voltage pothead of the transformer. Secondly, the operation of the high-voltage feeders without regulators, at 27,000 volts, direct from the generating station. Thirdly, the ultimate plan of interlacing the high-voltage feeders to reduce the overload on transformers and to maintain good voltage regulation with one feeder out of service, and to pick up overload in areas of different load characteristics to obtain the advantage of diversity. It is shown that this plan of development ensures better service to the customer from every point of view, makes for safer working conditions on the system, results in general system improvement and involves less total investment, as well as a considerable reduction in losses and operating costs. The appendices describe tests made to determine whether arcing and short-circuit faults in the network will be self-clearing, the permissible voltage fluctuations on incandescent lamps, and the dissipation of heat from transformer vaults.

Italian Electrical Associations.

Hitherto there have been two electrical engineering associations in Italy—the A.E.I.E. and the A.N.I.E.L. It is now reported from Rome that an amalgamation has been effected of the two bodies, which will in future be known as the Unione Nazionale Industrie Elettriche. Signors S. E. Volpi and G. Ponti have been elected as the first honorary and acting presidents, respectively.

A Helium-Oxygen Atmosphere for Divers.

The use of a mixture of helium and oxygen in place of air for breathing in deep diving and other high-pressure work is reported by the Bureau of Mines, U.S.A., to result in greater speed of recovery from exposure to the high pressure, and in freedom from the suffering and danger due to "bends"—*i.e.*, the excessive absorption of nitrogen by the blood. Writing to *Science* of January 14th, Dr. Elihu Thomson, who was recently awarded the Faraday Medal by the Council of the Institution of Electrical Engineers, points out that he investigated the inhalation of mixed gases in 1873, and in 1919, when helium gas appeared to be available in quantity, he wrote to Dr. W. R. Whitney, of the Research Laboratory, General Electric Company, Schenectady, suggesting the use of helium and oxygen for respiration, as a means of extending the limit of depth attainable by divers. He also wrote to the Bureau of Mines in the hope of obtaining helium, but did not get any. A further letter was sent to Dr. J. C. McLennan, of the University of Toronto, in January, 1920, explaining his proposition, and the latter drew attention to the suggestion in *Nature*. Dr. Thomson complains that no acknowledgment of his priority of invention has been made by the Bureau of Mines. It was reported that the sunken submarine S-51 was raised by divers using this method.

Appointments Vacant.

Five engineering draughtsmen for H.M. Office of Works. Salesman (£200) for the Corporation of Hastings Electricity Department. Chief electrical engineer for Synthetic Ammonia and Nitrates, Ltd. Switchboard attendant for the Norwich Corporation Electricity Department. Cable jointer for the Venezuela Telephone and Electrical Appliances Co., Ltd. Junior technical officers for the Admiralty Experimental Establishment. Costing clerk (£200) for the Borough of Great Yarmouth Electricity Department. Shift engineer for the Bedford Corporation Electricity Department. Chief engineer for the Bombay Electric Supply and Tramways Co., Ltd. (Rs. 2,100 per month). Shift charge engineer (£390) for the Croydon Electricity Department. Scientific officer for research for the Air Ministry (£504). Three district mains engineers (£366) for the Hackney Borough Council Electricity Department. Relief shift charge engineer for the Beckenham Urban District Council Electricity Department. Clerk of the works for the Seaham Harbour Electricity Department. (See our advertisement pages to-day.)

Lecture.

Water Power.—Speaking at the annual meeting of the Aberdeen Chamber of Commerce, Prof. Blackadder, of the Chair of Engineering at Aberdeen University, dealt with the water power in the north of Scotland. It had been computed that in this country there was about 900,000 h.p. which had some possibility of being reasonably developed in an economical manner, of which about 200,000 h.p. had been developed. In Scotland about 270,000 continuous h.p. was available which might be developed economically. Some of it was being developed by the Lochaber and Grampian schemes. Round about the Aberdeen district there were ten sources of power of the first rank for commercial development. Among them were Loch Skene, Loch Kinord, and Loch Muick (which had been surveyed), also Loch Einach and Loch Morlich, in the Cairngorms. Together, they were estimated to yield about 2,720 continuous horse-power, while the electricity station at Aberdeen was of 30,000 to 40,000 horse-power. That gave an idea of how little there really was compared with what seemed to the ordinary man to be the large amount available.

Tennis-Court Lighting.

Real tennis, which is one of the oldest ball games in the world, still has many enthusiastic adherents, and endeavours are being made to re-establish it as a national game. One of its ardent advocates is Capt. MacLean, whose famous court at Rusthall House, Tunbridge Wells, was first designed in 1884. In order that play may be possible at any hour, after a series of tests 12 1,000-watt Osram gasfilled lamps have been installed in the ceiling; they are mounted in special dispersive reflectors, and shielded so that players when facing the net are not affected by the brightness of the inner edge of the reflector. The scheme was designed by the General Electric Co., Ltd., and was carried out by Messrs. Fredk. Hayden, Ltd., of Tunbridge Wells. The system employed provides an average uniform intensity of light of the order of 25 foot-candles, as compared with an average daylight intensity of approximately 53 foot-candles at floor level; the maximum reading is 28.6 foot-candles, and the minimum 18.3 foot-candles. Daylight readings revealed a maximum of 91.8 and a minimum of 23.1 foot-candles, showing a disparity in light intensity of as much as 68.7 foot-candles between one part of the court and another, while the greatest disparity in illumination by artificial light is only 10.3 foot-candles.

Ex-British Westinghouse Reunion.

On March 11th, at the Hotel Cecil, London, Mr. Leslie R. Morshead presided at the ninth annual reunion of ex-British Westinghouse men. Mr. J. D. Allan proposed "The Association," and seized the opportunity to recall many humorous incidents of the days gone by. Mr. Morshead, in reply, was able to hold his own in his genial way. He remarked that the Association now had over 400 members, and said that it was probably unique in the electrical industry in that it was representative of every branch of the business. Later he submitted the "Silent Toast" to the memory of all those members who had passed away and particularly to the three who died during the past year, Messrs. T. Dagnall, R. C. Rogers, and J. Nasmith. The entertainment side of the reunion was this year enlivened by community singing. The usual ballot held for life membership of the Association was won by Mr. H. B. Tilley. The proceedings went with a swing from the start, and the evening generally was voted one of the best that had been held. We understand that the committee is making arrangements for the tenth reunion to be held next year at the Hotel Cecil, London, which is to be of a special character, as a "Milestone" occasion.

Free State Electricity Bill.

An Electricity Supply Bill, supplementary to the original Shannon Bill, introduced in the Free State Dail recently, aims at giving to the State complete control, not merely of the Shannon power system, but of all electricity concerns in the State. Provision is made for the constitution of a Board of Control, and it is proposed to allocate a sum not exceeding £3,100,000 for the acquisition, when necessary, of existing electrical undertakings. The necessary finances for the Board are to be provided from the Central Fund by the Free State Ministry of Finance, by way of loan, which must be repaid principal and interest, in such fashion as the Ministry requires. The Bill defines the general duty of the Board as follows:—To operate the Shannon works; to maintain them to distribute, utilise and sell electricity generated by the Shannon; and to control, co-ordinate and improve the supply, distribution and sale of electricity in the Free State. The measure provides that all charges made by the Board for electricity supplied after December 31st, 1932, must be such that the total revenue derived in any year will meet all the expenses of the administration in that year, and also provide for interest, sinking fund renewals, depreciation, &c. Six months after the passing of the Bill no person can sell electricity except under licence from the Board: *a*, as "permit" revokable at will by the Board, and *b*, as licence constituting him an "authorised undertaker" and undertaker" and giving him the powers now enjoyed by "statutory undertaker." The Bill provides that the Board of Control may compulsorily acquire any electricity undertaking and itself operate it, but it must indemnify the former owner from all debts and liabilities owned by him on account of the undertaking. Provision is also made for the Board to fix the retail prices for electricity to be charged to consumers by any undertaker, and, if an undertaker objects to the charge he can compel the Board to buy him out or to operate the business for him under terms laid down in the Bill. The Board can close generating stations or may require an undertaking to alter the type of current or the frequency or pressure of supply. This provision is designed apparently to secure standardisation of supply. A schedule to the Bill sets out the method of reckoning the compensation of persons who suffer loss of employment by reason of the closing down of a generating station.

Electrical Association for Women.

The fourth evening lecture arranged by the E.A.W. for women demonstrators and domestic science mistresses was given at the E.L.M.A. Lighting Service Bureau, London, on March 9th by Miss Margaret Partridge, B.Sc. With the aid of a few lampholders, pieces of flex, a screwdriver, and a pair of pliers, Miss Partridge kept her large audience interested for over an hour, showing how simple household repairs could be effected.

The lecture on March 23rd will be given by Mr. Morton, of Kelvinators, Ltd., on "Electric Power Appliances in the Home."

Extra-High-Pressure Cable Discharges.

In reply to inquiries that we made, we have received the following additional particulars from Mr. D. P. Sayers regarding the phenomena described in his letter on p. 370 of our March 4th issue:—In one case the cable was 0.15-sq. in., 3-core, paper-insulated and lead-covered (no earth sheaths), 11-kV working pressure, and wire armoured with one layer of jute under and over the armour wires. The cable was laid direct in the ground for a distance of five or six miles, and each end was terminated in a switch cubicle, the tails being bolted to isolators. The terminal box at one end had a copper bond bolted to a main earthing strip running throughout the cubicle-type switchboard, and the box was bonded to the cable with a brass gland wiped to the lead. The cable was tested at about 30 kV, direct current, obtained from a spark rectification set, and after it had been discharged, a copper strip was bolted across the three bottom isolator blocks and to the main earthing strip. There was no question that the lead, armour, and cores were efficiently earthed, as this end was handled without any effects, and it was not until an hour or so afterwards that a shock was obtained from the cores at the other end of the line.

Another case occurred with one of three single-core cables, paper-insulated, lead-covered, 0.2-sq. in. section, built for a working pressure of 33 kV to earth. About 660 yards of this cable was laid in ducts or troughing alongside the permanent way of a railway, and was then tested at about 140 kV with a Delon set. The cable sheath, together with the frame of the testing set, was earthed to the rails by means of a special clip made for the purpose, and the extra precaution had been taken of connecting a copper band to a near-by water main. After the test, the lead sheath was beaten down on to the copper core and plumbed over, and subsequently during the same process at the other end of the line, a shock was obtained.

Low-Temperature Carbonisation.

In a publication under the above heading of the Department of Scientific and Industrial Research, Fuel Research Technical Paper No. 17, price 6d. net, a preliminary account is given of the construction and behaviour of the latest vertical cast-iron retorts erected at the Fuel Research Station of the Department for the low-temperature carbonisation of bituminous coal.

A French Science Meeting.

A four-days' meeting of the French Association for the Advancement of Science is to be held in Algiers from April 13th to 16th next. M. Miramont de la Roquette, of that city, has been appointed chairman of the Electrical Section of the Conference.

Standard Transport Cost Sheet.

For some time past the Electric Vehicle Committee of Great Britain has been designing and compiling a standard form of cost sheet for owners of electric vehicles, in particular, though the sheet produced can be used in connection with other types of transport, and therefore forms a ready means of obtaining a fair comparison of working costs. The accurate determination of such costs is most important to every business concern; it will enable the user to see at a glance how his money is spent on transport, and to ascertain quickly which system is the most economical under his own particular working conditions. Copies of the cost sheet are obtainable from the British Electrical Development Association, 15, Savoy Street, London, W.C.2, price 1s. 3d. per dozen, or 10s. per hundred, postage extra.

Institution Notes.

Institution of Electrical Engineers.

INFORMAL MEETING.—At the informal meeting, on March 7th, Lt.-Col. K. Edgcumbe was in the chair, when Capt. P. P. Eckersley opened a discussion on "Wireless as a Factor in World Communication"; sketching the history of broadcasting, he reviewed apparatus of the past, paying a special tribute to the work of Hughes, who developed the first coherer. He said arc transmission was no doubt a robust engineering job, which accounted for the fact that there were more arc stations now in existence than any others. He emphasised his view that the true function of broadcasting was its use for communication where no better means were available; and that its object was not merely to provide a weak reflection of theatrical or concert entertainment. He believed there was an enormous future for wireless communication operating during the dull hours on a deferred-letter basis, but anticipated a breathing space of fifteen or twenty years before television need be considered as a candidate for a few wave-lengths.

Diesel Engine Users' Association.

At the March meeting of the Association a paper by Mr. P. A. Holliday on "High-Revolution Oil Engines" was read. The author referred to the satisfactory working results of heavy-oil plant in the power stations of the Southend-on-Sea Corporation, ex-submarine engines which had been converted for land use. He said it was difficult to determine the source of prejudice which undoubtedly existed in some quarters against high-revolution engines running on heavy oil. If revolutions, particularly those of the four-cycle, single-acting engines, were to remain at the old level, where must one look for progress? Viewing the possibilities of progress in electricity generating sets for land and sea, it was reasonable to expect some reduction in weight and occupied space; it had not yet been determined to what extent it would be possible to carry the high-revolution engine design into larger powers.

The Institute of Metals.

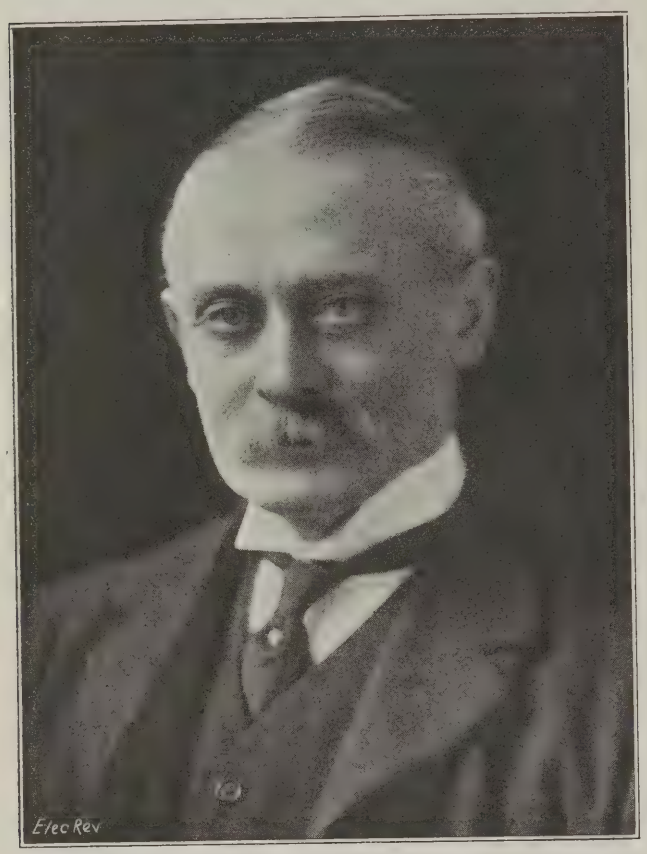
The annual general meeting of the Institute of Metals was held in London on March 9th and 10th, and amongst the numerous papers presented were those mentioned below:—

A paper entitled the "Investigation of the Effects of Impurities on Copper: Part V—The Effect of Bismuth on Copper," by Prof. D. Hanson, D.Sc., and Grace W. Ford, B.Sc. (Teddington), describes experiments made on copper containing up to 0.1 per cent. of bismuth, and the effects of small quantities of bismuth on the casting, hot- and cold-rolling, mechanical properties, electrical conductivity, and microstructure of copper. They confirm the great embrittling effect of bismuth, and indicate that when more than a trace of bismuth alone is present in copper the working properties, particularly the cold-working properties, are seriously affected; the solid solubility of bismuth in copper has also been investigated.

In Part III—"The Effect of Arsenic on Copper," Prof. D. Hanson, D.Sc. (Birmingham), and C. B. Marryat, B.Sc. (Teddington), describe investigations into the effects of arsenic on a series of alloys containing up to 1 per cent. of arsenic. Part IV deals with a similar series of tests on copper containing up to 2 per cent. of arsenic and 0.1 per cent. of oxygen, with a view to ascertaining the influence of each of these elements on the presence of the other. Experiments on the gassing of copper by hydrogen have also been undertaken. The effect of arsenic on the conductivity of the metal is very profound; it is much greater than the effect of oxygen and iron, and is such that arsenic should be excluded as rigidly as possible from high-conductivity copper. The impurity appears to reduce the crystal size in castings, but this effect is not appreciable in worked and annealed material. It was found that with copper containing oxygen in addition to arsenic little difference in the electrical conductivity was observed.

A paper on "Electric Furnaces in Non-Ferrous Metallurgy," by D. F. Campbell, M.A., A.R.S.M. (London), deals in a practical way with the principal electric furnaces now used for melting alloys of copper, nickel, zinc, and silver, with special reference to induction furnaces of normal and high frequency.

A paper on "The Mechanism of Inverse Segregation in Alloys" contains an appendix on "The Accurate Determination of Copper in Bronze by Electrolysis." by R. A. F. Hammond, B.Sc., A.R.C.Sc., A.I.C. (Woolwich).



A paper on "Magnetic Analysis as a Means of Studying the Structure of Non-Magnetic Alloys," by Prof. K. Honda, Sc.D. (Sendai, Japan), and Prof. H. Endo, M.Sc. (Sendai, Japan), shows by means of examples that magnetic analysis applied to the case of non-magnetic elements, which are paramagnetic or diamagnetic, affords a very convenient method of studying the equilibrium diagram for the alloys consisting of these elements. Not only is the melting, or transformation, point of an element given by a sharp discontinuity of the susceptibility-temperature curve, but the liquidus and the solidus of an alloy are also marked by a sharp break, or bend, in the same curve; in some cases, small solubility is marked by a very large abrupt diminution of the diamagnetic susceptibility of one component on adding a small quantity of the other. Magnetic analysis is also a very convenient method for the study of the actual state of an alloy when above its melting point, that is, in detecting the existence of an intermetallic compound in the liquid phase, the degree of dissociation of the compound with the rise of temperature, &c.

The Council reported that the membership had grown to 1,801. Research had been made during the year into problems connected with the corrosion and protection of condenser tubes, and had resulted in a simple explanation being found for a number of actual cases of corrosion.

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.

At a meeting of the Grand Council of the Federation of British Industries on March 9th, Lord Gainford, P.C,. D.L., was nominated as president-elect of the Federation in succession to Sir Max Muspratt, Bt. Lord Gainford's

Elliott & Fry] [*London.*

Lord Gainford, P.C., D.L.,
President-elect of the F.B.I.

activities lie mainly in the direction of collieries; he is a director (and vice-chairman) of Pease & Partners, Ltd., and many other colliery companies. To electrical men he is known as a director of the County of London Electric Supply Co., Ltd., while he is familiar to the public as vice-chairman of the British Broadcasting Corporation. Apart from his industrial experience, Lord Gainford has had a long career in the public service. In 1889 he was Mayor of Darlington, and he subsequently sat in Parliament for about 14 years. He has held the posts of President of the Board of Education and Postmaster-General, among other appointments. During the war he served on the Claims Commission in France and Italy.

Mr. J. H. Tonge, M.I.E.E., consulting engineer, has been elected president of the Rotary Club at Preston. Prior to his retirement at the end of 1922, Mr. Tonge was for 30 years managing engineer of the Preston electricity undertaking, most of the time for the National Electric Supply Co., Ltd.

Mr. R. C. Harris, electrical manager for Messrs. Clarke, Chapman & Co., Ltd., of Gateshead-on-Tyne, who has been with the firm for 20 years, is resigning his position and is taking up agencies in the N.E. Coast area.

Leeds Corporation Tramways Committee recommends increasing the salary of Mr. W. Chamberlain, the general manager and chief engineer, from £1,500 to £1,600 per annum.

The *Financial Times* states that Mr. W. Higgins, chairman of the Pernambuco Tramways and Power Co., recently left for Brazil, accompanied by the secretary, Mr. H. Harper, in order to visit the company's properties in Pernambuco.

Mr. James A. Erskine, a graduate of the Royal Technical College, Glasgow, has received an appointment in the electrical engineering department of the Monongahela Coal Operators' Association, Virginia, U.S.A. He has had experience of mines in Scotland and Canada.

We congratulate Mr. Francis C. Polden, the well-known City electrical contractor, upon his election to the Court of Common Council of the City of London as a representative of the Vintry Ward.

Mr. F. J. Cleveland has given up his position as chief technical assistant to Messrs. J. S. Withers & Spooner, and has opened an office as a patent agent at Bank Chambers, 29, Southampton Buildings, Chancery Lane, W.C.2.

The new chairman of the London County Council is Mr J. M. Gatti, managing director of the Charing Cross Electricity Supply Co., Ltd.

The paragraph in our last issue relating to the salary of the Southport borough electrical engineer was incorrect. We understand that no increase of Mr. Moxon's salary has been under consideration.

Obituary.—Mr. A. C. Forshaw.—The death took place on March 9th at Stockport of Mr. Alfred Christian Forshaw, who was for many years with the Direct United States Cable Co., first in Liverpool and later in London, where he was general manager of the Metropolitan office. He was 80 years of age.

Ald. E. B. Smith.—The death was announced last week of Alderman Edward Bremner Smith, J.P., chairman of the Oswestry Electric Lighting Co.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Synchronola Radio Co., Ltd.—Private company. Registered March 2nd. Capital, £400 in 317 ordinary shares of £1 each and 1,660 deferred shares of 1s. each. Objects: To carry on the business of manufacturers of and dealers in the high-frequency radio transformer invented by W. & F. Butterworth, and to register the name "Synchronola" as a trade mark to be applied to this transformer. The permanent directors are:—W. Butterworth (chairman), 39, Bottom-o'-th'-Moor, Chorley Old Road, Bolton; F. Butterworth (managing director), 150, Brownlow Road, Horwich; Dr. B. Rai, Duff House, Horwich. Qualification of first directors: one share; of other directors, 150 ordinary shares. Remuneration as fixed by the company. Registered office: 150, Brownlow Road, Horwich, near Bolton.

Alpha Electric Welding Co., Ltd.—Private company. Registered March 7th. Capital, £1,000 in £1 shares. Objects: To acquire the business of boiler repairers and general engineers, &c., carried on as "The Alpha Electric and Oxy-Acetylene Welding Co., Ltd.," at Newport, Mon., and at Swansea, Glam. The subscribers (each with one share are:—F. A. Saunders, 55, Lambert Street, Newport, Mon accountant; F. Pinnett, Chaseley, Alteryn Avenue, Newport Mon., clerk. The first directors are to be appointed by th company or subscribers. Qualification, £25 shares. Remunera tion as fixed by the company. Secretary: F. A. Saunder 55, Lambert Street, Newport, Mon.

Strouds (Bellingham), Ltd.—Private company. Regis tered March 5th. Capital, £100 in £1 shares. Objects: T carry on the business of electricians, electrical, radio an mechanical engineers, manufacturers of and dealers in a apparatus used in connection with wireless telephony, & The first directors are:—Mrs. Ethel E. Stroud (chairman), Farmfield Road, Downham, Bromley, Kent; C. J. Turner, 6 Simpsons Road. Bromley, Kent. Qualification: £1. Solicitors Cohen, Dunn, Page & Moore, Audrey House, Ely Place, E.C. Registered office: Bellingham Station Buildings, Catford, S.

Winfield & Reeves, Ltd.—Private company. Registere March 5th. Capital, £200 in 1s. shares. Objects: To carr on business as manufacturers of electrical fittings and illum nated signs, metal workers, &c. The directors are:—R. Winfield, 11, Nelson Crescent, Ramsgate, electrical enginee C. H. Morrell, 1, The Terrace, Champion Hill, S.E.5, accoun ant; E. J. Evershed, 60, The Ridgway, Wimbledon, S.W.1

solicitor (managing director); W. G. Reeves, 160, Commercial Road, Peckham, S.E.15, electrical engineer. Secretary: C. H. Morrell. Solicitors and registered office: Helliwell, Harby and Evershed, 231, Strand, W.C.2.

J. Briggs Electrical Contractors, Ltd.—Private company. Registered March 10th. Capital, £5,000 in £1 shares. Objects: To acquire the business carried on at Golden Square, Regent Street, W., as "J. Briggs & Company," and to carry on the business of electrical engineers and contractors, &c. The directors are:—J. G. Briggs, "Dalkeith," Ickenham, Middlesex, electrical engineer (permanent chairman and managing director); C. V. Ramsey, 17, Church Lane, Hornsey, N.8, surveyor. Registered office: Grafton House, Golden Square, W.1.

Macilafone Co., Ltd.—Private company. Registered March 9th. Capital, £2,000 in 1,900 10 per cent. preference shares of £1 each and 2,000 ordinary shares of 1s. each. Objects: To carry on the business of manufacturers of and dealers in all kinds of telephone appliances and parts thereof, &c. The subscribers (each with one £1 share) are:—E. McBean, 7, Avignon Road, Brockley, S.E.4, solicitor's clerk; J. G. Argold, 2, Dacre Gardens, Lee, S.E.13, solicitor's clerk. The first directors are to be appointed by the subscribers. Secretary (*pro tem.*): E. McBean. Solicitors: W. H. Speed and Co., 18, Sackville Street, Piccadilly, W.1. Registered office: Thanet House, 231, Strand, W.C.2.

Electro Trust, Ltd.—Public company. Registered March 11th, with a nominal capital of £300,000 in £1 shares (180,000 6 per cent. cumulative preference and 120,000 ordinary). The objects are to acquire and hold shares, stocks, debentures, debenture stock, bonds, obligations and securities issued or guaranteed by any company, constituted or carrying on business in Great Britain or elsewhere, and in particular by any company dealing in electric lighting, electrical appliances of all kinds, or any business relating to electricity, &c. The minimum cash subscription is seven shares. The subscribers (each with one ordinary share) are:—F. C. Howard, E. G. C. Jones, H. Quennell, A. J. Graham, A. M. Welsford, R. J. L. Scott, and G. T. Weeks, all solicitors, of 18, Austin Friars, E.C. The first directors (to number not less than three nor more than six) are to be appointed by the subscribers. Qualification, £250 shares or stock. Solicitors: Slaughter & May, 18, Austin Friars, E.C.2.

Nigerian Power and Tinfields, Ltd.—Public company. Registered March 10th. Capital, £100 in 5s. shares. The objects are to carry on in Nigeria or elsewhere the business of producers and suppliers of electric power, electricians, mechanical engineers and manufacturers, workers and dealers in electricity, motive power and light; to acquire or obtain control of mines, minerals, mineral and other properties, &c. The minimum cash subscription is seven shares. The subscribers (each with one share) are:—L. C. Walker, 79, St. George's Avenue, Tufnell Park, N.7, incorporated accountant; H. J. Guntay, "Langston," Riverhead, Kent, secretary to public company; R. S. Williams, 21, Ventnor Villas, Hove, Sussex, merchant; and four others. Qualification, 100 shares. Remuneration, £250 each per annum (chairman £300), free of income tax (but not super-tax), and a percentage of the profits. Solicitors: Birkbeck, Yeo & Co., Finsbury House, E.C.2. The registered office is at Finsbury Pavement House, E.C.2.

Official Returns of Electrical Companies.

North Metropolitan Power Station Co., Ltd.—Trust deed dated February 25th, 1927, to secure £850,000 debenture stock, charged on freehold land at Enfield, with buildings, plant and machinery thereon, rentals or other sums receivable by the company under an agreement dated October 5th, 1926, or under a lease dated February 2nd, 1927, and all rights and interest of the company therein and (as a floating charge) on the company's undertaking and other property, present and future, including uncalled capital. Trustees: Consolidated Trust, Ltd., Dashwood House, 69, Old Broad Street, E.C.2.

Pinnacle Switchgear, Ltd.—Satisfaction in full on February 28th, 1927, of debenture dated July 20th, 1926, securing £1,000. First debenture dated February 28th, 1927, to secure £3,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: T. M. Richards, 12, Kildare Gardens, W.2.

W. L. Gray, Ltd.—Particulars filed of £750 debentures, authorised February 2nd, 1927, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Beko Lamp Co., Ltd.—Debenture charged on the company's undertaking and property, present and future, including uncalled capital, dated February 16th, 1927, to secure all moneys due or to become due from the company to Barclay's Bank, Ltd.

Temple Cox Research Co., Ltd.—Issue on February 14th, 1927, of £430 debentures, part of a series.

Joseph Evans & Sons (Wolverhampton), Ltd.—Satisfaction to the extent of £1,000 on February 28th, 1927, of debentures dated December 18th, 1907, securing £50,000.

International Wireless Manufacturers, Ltd.—H. Smith, of 4, York Buildings, Adelphi, W.C.2, ceased to act as receiver and manager on January 16th, 1927.

Natwirco, Ltd.—H. E. Burgess, Senior Official Receiver, of 33, Carey Street, W.C.2, was appointed receiver on March 2nd, 1927, under powers contained in debenture dated October 22nd, 1926.

City Notes.

County of London Electric Supply Co., Ltd.

The directors' report for the year ended December 31st last states that the amount available for distribution, including £24,098 brought forward, was £794,350. After meeting debenture interest, &c., transferring £28,975 to the contingency fund, and £190,679 to the depreciation reserve, there remains a balance of £466,541. An interim dividend at 5 per cent. was paid on 1,330,000 ordinary shares; it is proposed to pay a final dividend at 5 per cent. on 3,103,334 ordinary shares, leaving £51,374 to be carried forward. The net capital expenditure during the year was £1,326,185, of which £813,089 was accounted for by mains and £219,998 by buildings. The total capital expenditure now stands at £8,411,397. The amount of energy sold during the year was 145,714,062 kWh, as compared with 93,845,622 kWh in 1925; the number of consumers rose by 14,517 to over 84,500. The report makes mention of the capitalisation of reserves and the allotment of four new shares to each three ordinary shares held by the shareholders. During the year the company obtained a Special Order for the Merstham area, and the mains have now been extended to that area. A Bill is being promoted in the present session of Parliament for the extension of the company's powers and its area of supply in the County of Essex, and for other purposes. To deal with the increased load and prospective demands the company secured the Electricity Commissioners' consent to the completion of the first section of the Barking station, and the work was commenced in May last. The meeting is to be held on March 29th.

Liverpool Overhead Railway Co.

The annual meeting was held at Liverpool, on March 9th Mr. M. H. Maxwell presiding. The chairman said the past year had been full of difficulties to the board and the management, and the results were disappointing. Reductions in expenditure had been effected by changes in the staff, and the effect of that would be felt in the current year. Alluding to the tramway service, now discontinued, he said there had been written off £30,763 against tramways capital account, but apart from the tram shed and certain cables which were being used by the railway, the cars and equipment formerly in use would realise little more than scrap value. Competition with the Liverpool Corporation tramway system and the L.M. & S. Railway had to be reckoned with. The company could not raise its fares, and it was out of the question to reduce them to the level of the tramways. Negotiations had been continued with the Corporation, and it was thought possible that the company might be able to obtain a quotation for a supply of power on favourable terms, which would obviate a capital expenditure of about £13,000. At the same time, the directors were making investigations as to the advisability of installing a turbine set at the generating station, which would reduce the cost of generation. It was hoped that a new station just south of the new Gladstone Dock would be ready for traffic when the new dock was officially opened next July.

German Companies.

The *German-Atlantic Telegraph Co.*, Berlin, reports net profit and balance forward amounting to 152,000 marks, as against 13,000 marks in 1925; half is transferred to the reserve fund and the balance carried forward. It is mentioned that the Emden-Azores cable is now open to traffic, and a dividend is expected for the current year.

The *Elektra Co.*, Dresden, reports net profits of 1,385,000 marks for 1926, as against 1,231,000 marks in the previous year. It is proposed to pay a dividend of 12 per cent. on the share capital of 10,000,000 marks, as against 10 per cent. for 1925.

The *Saxony Works, Light and Power Co.*, Dresden-Niedersedlitz, states that, in spite of unfavourable conditions, the turnover during 1926 was approximately the same as in the preceding year. The net profits were 755,000 marks, and the dividend remains at 6 per cent.

Stock Exchange Notices.

Application has been made to the Committee to allow the following to be officially quoted:—

Adelaide Electric Supply Co.—250,000 6½ per cent. "C" cumulative preference shares of £1 each, fully paid, Nos. 500,001 to 750,000.

Metropolitan Electric Supply Co.—500,000 ordinary shares of £1 each, fully paid, Nos. 1,000,001 to 1,500,000.

Yorkshire Electric Power Co.—773,000 6 per cent. cumulative preference shares of £1 each, fully paid, Nos. 830,001 to 1,603,000.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

Electrical Distribution of Yorkshire.—300,000 new ordinary shares of £1 each, issued at £1 5s. per share, partly paid and fully paid, Nos. 500,001 to 800,000.

Perak River Hydro-Electric Power.—331,237 ordinary shares of £1 each, fully paid, Nos. 1 to 331,237; £75,000 7 per cent. participating debenture stock.

Westminster Electric Supply Corporation, Ltd.

The report for 1926 is prefaced by a statement that the accounts have been prepared in accordance with the London Electricity (No. 2) Act, 1925, and are not comparable with those of previous years. The balance of net revenue for the year is £137,077, and from this are deducted interim dividends paid (1s. per share on ordinary), leaving £86,921. After meeting the balance of preference dividend it is proposed to pay a final dividend at the rate of £5 16s. per cent. on the ordinary shares and to carry forward £1,503. Sir A. B. W. Kennedy has retired from the post of engineer-in-chief, and he has been succeeded by Mr. P. L. Riviere. To fill the vacancy on the board thus caused and one due to the death of Mr. C. S. Gilman, Mr. W. A. Pearman (general manager) and Mr. D. M. Touche have been appointed directors. The capital account shows an expenditure of £179,704 since June 30th, 1925, principally upon mains. The amount of energy sold during the past year was 44,594,030 kWh. The meeting was to be held on Wednesday last.

Bristol Tramways and Carriage Co., Ltd.

The revenue for the past year amounted to £1,086,926 and the expenses to £985,267. With the balance brought forward, there is a net revenue of £107,073. After providing for debenture interest and preference dividend, it is proposed to transfer £10,000 to reserve for contingencies and renewals and to pay a final dividend of 4 per cent. on the ordinary shares, leaving £4,989 to be carried forward. The reserve fund now stands at £372 378. There were increases in the number of passengers carried and in the traffic revenue. The report records the death of Mr. J. H. Howell, a director, and states that Mr. S. E. Smith, C.B.E., manager for the last eight years, has been appointed to the board. The meeting was to be held yesterday (Thursday).

Hendon Electric Supply Co., Ltd.

After meeting debenture interest, preference and interim ordinary dividends, &c., for 1926, there remains a surplus of £31,749. Of this £5,726 is placed to general reserve, £5,000 to income-tax account, and £8,000 to repairs and renewals fund. A final dividend of 2s. per share, free of tax, is recommended on the ordinary shares, and after providing additional remuneration for directors, £2,014 is carried forward. The interim ordinary dividend was at the rate of 10 per cent., tax free. During the year an issue of 50,000 6 per cent. cumulative preference shares of £1 each was made, at the price of 20s. 6d. per share, and the premiums, totalling £1,285, have been transferred to general reserve. The meeting was to be held on Wednesday this week.

British Insulated Cables, Ltd.

The report for the year ended December 31st last records a profit of £607,853, to which is added £224,918 brought forward, making £832,771. After providing for debenture interest, preference dividend, interim ordinary dividend, &c., there remains £690,054, which it is proposed to allocate as follows:—Depreciation, £85,000; to reserve, £200,000; final dividend of 10 per cent. on the ordinary capital, making 15 per cent. for the year (£133,333); leaving £271,721 to be carried forward. The directors consider that in view of the difficult industrial conditions prevailing during the year under review, the results are satisfactory. They express their regret at the death of Sir J. S. Harmood Banner, Bt. (vice-chairman), who had been a director since 1902. The meeting is to be held on March 21st, at Liverpool.

Ericsson Telephones, Ltd.

A dividend of 8 per cent. is recommended on the ordinary shares. The dividend for 1925 was 16 per cent., and there was an issue of bonus shares.

Metropolitan Electric Supply Co., Ltd.

A final dividend at the rate of 12 per cent. per annum is recommended on the whole of the ordinary capital, making 8 per cent. for the year. This is equivalent to 12 per cent. on the old ordinary capital.

Imperial Tramways Co., Ltd.

The revenue account for 1926 shows that after paying the debenture interest and the interim preference dividend, there is an available balance of £12,452. Of this £3,814 is transferred to reserve for depreciation and contingencies, the balance of the preference dividend is paid, and a balance of £3,838 is carried forward. The company has received a dividend of 7 per cent. upon its holding of ordinary shares in the Bristol Tramways and Carriage Co., Ltd., but nothing has been received from the London and Suburban Traction Co., Ltd. The report records the death of Mr. J. H. Howell and the appointment of Mr. S. E. Smith, C.B.E., to fill his place on the board.

Waygood-Otis, Ltd.

The profit for the year ended December 31st last was £88,772, as compared with £45,180 for the last nine months of 1925. To this is added £17,428 brought forward, making £106,200. The reserve receives £45,000, £6,000 is transferred to the pensions fund, and after the payment of a final dividend of 7½ per cent. on the ordinary shares (making 10 per cent. for the year), £17,200 is carried forward. An equivalent dividend was paid in respect of 1925. A sum of £30,000 has been brought from the reserve for the purpose of writing down goodwill and patents to £30,000. The meeting was to be held on Wednesday last.

Bruce Peebles & Co., Ltd.

The report for 1926, which is to be presented at to-day's annual meeting, records a profit of £24,509, to which is added £8,656 brought forward, making £33,165. From this £5,000 is transferred to depreciation reserve, and after meeting the preference dividend, it is proposed to pay a dividend of 10 per cent. on the ordinary shares, leaving £6,812 to be carried forward. The separate factory for the production of transformers, which was mentioned in the last report, is now in full working order.

Midland Electric Corporation for Power Distribution, Ltd.

The net profit for the past year fell from £173,307 to £163,481. Adding £30,963 brought forward, there is an available balance of £194,444. After paying debenture interest, allocating £30,000 to depreciation and £50,000 to reserve, it is proposed to pay a final dividend of 2s. per share on the old ordinary shares (making 10 per cent. for the year as for 1925) and 1s. 4½d. per share on the new shares, leaving £31,132 to be carried forward. In the previous year £40,000 was devoted to depreciation; the contribution to reserve was the same. Meeting: March 21st.

Ceara Tramway, Light and Power Co., Ltd.

Speaking at the recent annual meeting, the chairman (Mr. E. H. R. Trenow) said that in less than three years the company had been able to provide additional equipment to the value of over £50,000 without raising new capital. In the same period the debenture debt had been reduced from £309,000 to £252,000. During the last ten years there had been unbroken progress and the gross income had increased nearly four-fold. The directors asked for power to apply part of the balance of profit carried forward in the repayment of outstanding profit warrants and in payment of a dividend not exceeding 2½ per cent. on the ordinary shares. The report and accounts were adopted.

American Telephone and Telegraph Co.

The report for 1926 states that the total earnings were $197,910,965 and the net earnings $138,931,386. Interest absorbed $21,940,986, dividends $86,496,345, and contingency reserve $4,000,000, leaving $24,494,055, which has been carried to surplus. During the year 781,000 telephones were added to the system, making the total 17,574,000. The company's assets are valued at $3,256,000,000. The Bell System's accounts show total revenues of $823,216,735 and a net income of $155,061,019. Dividends took $100,614,437 and miscellaneous appropriations $5,048,000, leaving a balance of $49,398,582.

Marconi's Wireless Telegraph Co., Ltd.

At the annual meeting on Tuesday last the directors' proposals, which were outlined in our last issue, were adopted. A report of the meeting will appear in our next issue.

St. James' and Pall Mall Electric Light Co., Ltd.

The directors announce a final dividend of 1s. 3.3d. per share on the ordinary shares, making, with the interim payment, the standard dividend for the year in accordance with the London Electricity (No. 2) Act.

London Electric Supply Corporation, Ltd.

A final ordinary dividend of £5 11s. 5 1/7d. per cent. has been declared, making £8 8s. 6 6/7d. per cent. for the year.

Swiss Company.

The *Swiss Company for the Electrotechnical Industry*, Basle, proposes to pay a dividend of 8 per cent. on each of the three classes of shares for 1926, as in 1925.

Newcastle and District Electric Lighting Co., Ltd.

Although the prolonged coal stoppage last year adversely affected the company's business the net profit was slightly higher at £16,8.0, after providing for debenture interest, &c., and allowing £18,000 for depreciation (as against £20,000 in 1925). Adding £15,545 brought forward, there is an available balance of £32,355. As reported last week, it is proposed to pay a dividend of 7 per cent., leaving £15,555 to be carried forward. During the year mortgage debentures to the extent of £4,360 were redeemed and loans amounting to £2,973 were repaid. The meeting was to be held yesterday (Thursday).

City of London Electric Lighting Co., Ltd.

The directors recommend the payment of the balance of the preference dividends and a final dividend of 2s. per share on the ordinary shares, making 15 per cent. for the year. They have also decided to capitalise £400,000 of the company's reserves and to distribute to the ordinary shareholders 400,000 ordinary shares of £1 each, credited as fully paid, in the proportion of one such share for every two existing ordinary shares. These new shares will rank *pari passu* with the existing ordinary shares as from January 1st, 1927, and therefore will not participate in the above dividend.

Davis & Timmins, Ltd.

Out of a net profit of £3,747 for 1926, plus £24,588 brought forward, it is proposed to pay a final ordinary dividend at the rate of 10 per cent. per annum, making 8 per cent. for the year. £18,894 is carried forward. Messrs. J. Kerr-Bock and F. Le Neve Foster have been appointed to vacancies upon the board caused by the death of Sir Henry Mance and Mr. V. Negus. Last year's dividend on the ordinary shares was the same, but there was also a bonus of 17 per cent., free of tax.

Tees Power Station Co., Ltd.

The profit for the past year was £85,009, and after providing for debenture interest and reserve (£20,000), and adding £1,764 brought forward, there is available £37,799. It is proposed to pay a dividend of 3¾ per cent. (as for 1925) and to carry forward £2,062. The authorised share capital has been increased to £975,000 by the creation of 40,000 new £1 shares, and 20,000 of these have been allotted to the Newcastle-upon-Tyne Electric Supply Co., Ltd.

Telegraph Construction and Maintenance Co., Ltd.

The report for the past year shows a net profit of £125,910. Adding £105,852 brought forward, there is available £231,762. It is proposed to transfer £30,000 to reserve (making £330,000), to pay a final dividend of 7½ per cent., free of tax (making 15 per cent. for the year, as for 1925), and to carry forward £112,123. The meeting was to be held yesterday (Thursday).

W. Canning & Co., Ltd.

The profit for the year ended December 31st last was £41,336, and to it is added £4,228 brought forward, making £45,564. A dividend of 10 per cent., plus a bonus of 6d. per share, is recommended on the ordinary shares, £10,000 is transferred to reserve, and £1,000 is put to the employés' benevolent trust fund, leaving £4,564 to be carried forward.

Automatic Telephone Manufacturing Co., Ltd.

The profit for the past year was £161,497. It is proposed to allocate £40,000 to depreciation and £35,000 to general reserve, and after paying a final ordinary dividend of 6¼ per cent. (making 10 per cent., as in 1925), £59,851 is carried forward.

International Automatic Telephone Co., Ltd.

The report for 1926 shows a profit of £119,884 (against £109,522). It is proposed to pay a final dividend of 6¼ per cent. on the ordinary shares (making 10 per cent. as before), and a dividend of 10 per cent. on the deferred shares (the same), leaving £38,583 to be carried forward.

Colombo Electric Tramways and Lighting Co., Ltd.

The Colombo correspondent of the *Financial Times* reports that the Ceylon Government has agreed to purchase the company's lighting and power undertaking for £245,000. The traction system, which is operated under a municipal concession, remains unaffected.

Radio Corporation of America.

The net profit for the past year was $7,367,100 (as compared with $5,737,206). Of this, $1,855,090 has been allocated to reserves for patents, &c., and $4,632,010 has been added to surplus account. The current assets now exceed current liabilities by $19,167,824.

Pinchin, Johnson & Co., Ltd.

The net profit for 1926 was £148,339, as compared with £142,276 for 1925. The reserve receives £27 000 (as against £25,000), the ordinary dividend is maintained at 30 per cent., and £30,571 is carried forward.

Stewarts & Lloyds, Ltd.

A dividend of 2½ per cent. has been declared on the ordinary shares, as against 7½ per cent. last year.

County of Durham Electrical Power Distribution Co.

The report for 1926 shows a net profit of £34,477, and to this is added £2,242 brought forward, making £36,719. It is proposed to pay a dividend of 6¾ per cent. (as against 6 per cent. for 1925) on the ordinary shares and to carry forward £607. The meeting was to be held on Wednesday last.

Cammell Laird & Co., Ltd.

The directors report a loss of £73,575 for 1926, and are unable to recommend dividends on the preference or ordinary shares. The last ordinary dividend (5 per cent.) was paid in 1922.

English Electric Co., Ltd.

The directors state that they are unable to recommend the payment of the final dividend on the preference shares. The last ordinary dividend was 5 per cent. for 1924.

Hadfields, Ltd.

A dividend of 2½ per cent. has been declared on the ordinary shares, as against 3 per cent. for 1925.

Bogota Telephone Co., Ltd.

An interim dividend of 5 per cent. has been declared.

Stocks and Shares.

MONDAY EVENING.

WITH the Budget so near at hand, Stock Exchange markets are taking an active interest in its possibilities. The investment stocks and shares are vulnerable to fresh taxation proposals that fall directly upon incomes or estates. Faced with a probable deficit of at least 30 millions in respect of the current financial year, the Chancellor has to budget for a coming twelvemonth that should be free from such industrial disturbances as a general strike and a coal stoppage. Mr. Churchill has a reputation of readiness for the acceptance of sporting risks. The voices of authority proclaim that national trade is on the eve of pronounced revival. Taking these two considerations in conjunction, the Stock Exchange is disposed to look for no further direct taxation than that which may perhaps fall upon tobacco, foreign wines, and a few licence duties. Prices of investment stocks are therefore moderately steady, although business in such securities travels upon a narrow gauge.

The English Electric Company provided rather an unpleasant shock to equipment shares as a whole by passing the final dividend on its preference shares. The interim dividend was duly met last September. Of late the price of the ordinary—which shares have received nothing since 1s. in May, 1925—has shown a very dull tendency, but expectation had assumed the payment of the preference dividend this month, and the postponement came as a surprise. The shares are cumulative. On the week the price is 4s. down at 13s. 6d., and the ordinary dropped 2s. 6d. to 11s. 3d. Both classes of shares are difficult at present to sell.

Siemens gave way to 28s. 9d., and a dull tendency set in, but Metropolitan-Vickers gained 1s. to 29s. 3d., and General Electrics put on a few pence.

General Electric ordinary shares are the subject of a special recommendation by the First British Guaranty Trust, Ltd., in a weekly circular issued by this firm, who consider that an immediate purchase on three-monthly account should show very satisfactory results. The firm "confidently expect to see an advance in the shares from their present quotation of 32s. to £2 or over," between now and the issue of the report at the end of June. The G.E.C. paid 7½ per cent. last year, 6 per cent. for 1925, and the First British Guaranty Trust looks for 10 per cent. shortly. The last-named may not be an unreasonable, even if it is an optimistic, anticipation, but if it were to be fulfilled, £2 per share would look a high price, giving 5 per cent. on the money. Nothing is said in the advice as to whether the firm buy any shares in the Stock Exchange market if an investor accepts their offer to pay 20 per cent. of the purchase price (calculated upon the market value) now, with no further obligation to put up more money until the end of three months. The offer is not one that will commend itself to the prudence of the investor who likes to know that his shares have actually been purchased and that he has some tangible security given him in exchange for the 20 per cent. of the purchase price of the shares which he is asked to provide.

Further consideration is being given to the issues of the provincial power and supply undertakings. The Llanelly and District Electric Company pays no dividend for last year (ELECTRICAL REVIEW, p. 401), owing to the coal dispute, and the Fife Tramway, Light and Power Company has cut its dividend from 6 per cent. to 3 per cent. Nevertheless, the market is not a bad one. Lancashire Light and Power and Midland Counties are both harder. Electrical Distribution of Yorkshire ordinary are changing hands around 29s. The new shares, issued at 25s. in the proportion of three for five old shares, have become negotiable, the price being about 2s. 9d. premium. A fair demand for them has already developed.

Another dramatic rise in Brazilian Tractions, lifting the price 4 points to 132—last Friday it touched 134—is an outstanding feature of the markets. The preferred improved to 115. The persistent nature of the demand gives the buying an air of American inspiration. Most stocks and shares connected with Brazil have lately benefited by the hope that the country may resume, this year, the sinking fund for redemption of Brazilian bonds, and the Traction Company is declared to be doing very well. For shares in respect of 6 per cent. dividends to stand at 132 obviously requires special justification. Anglo-Argentine Trams are better, and the Mexican Utility group is still moving in favour of stockholders. A rally of 4 in British Columbia Electric Railway deferred stock, after the continuous dwindling in the price, attests the impression that the fall had gone far enough to render the stock an attractive investment. Private advices from Vancouver go to show that British Columbia is participating in the more prosperous conditions which have returned to Canada. Singapore Trams strengthened to 10s.

British Electric Traction ordinary stock remains at 145½; if it were to be quoted amongst trust companies' stocks, as it should be, the price would probably stand higher. A steady advance in the ordinary and deferred issues of the trust group is one of the minor features of present-day markets, but B.E.T. is still included amongst "Tramway and Omnibus" descriptions in the Stock Exchange Official List. There is only a limited market in the stock; its price of 145½ looks high; but, as a lock-up investment, it deserves inclusion in any well-chosen list of holdings for probable appreciation in value.

Notable strength is shown by Districts, where the price quoted ex dividend last week is 3 points up at 60½. Metropolitan Consolidated has strengthened to 64, and Underground £1 shares are the centre of lively animation at their advanced price of 16s. 3d. London Electric ordinary is 2 points harder at 60½ ex dividend. A rise of 1½ lifted London United Tramways 4 per cent. debenture to 51, and the preference rose to 5s. 6d. London and Suburban Traction preference put on a few pence at 7s. Metropolitan Electric Tramways 4½ per cent. debenture is 2 up at 65½.

Marconis present a better aspect than they have done for some time past. The price touched 17s. and then reacted a trifle. This week's meeting is expected to give the board the necessary majority for passing the directors' resolutions. These latter met with vigorous opposition from the English Shareholders' Committee, but the board has received support, both strong and influential. If the official recommendations are carried, the outlook for the Marconi Company is promising, and an early return of dividends seems to be reasonably assured. Marconi Marines are 9d. higher at 23s. 3d., and Canadian Marconis strengthened to 4s. The meeting on Tuesday in this week was expected to prove a lively affair.

Several interesting reports have made their appearance during the past few days. The County of London Electric Supply had a net revenue for 1926 of £770,250, being nearly £47,000 higher than the 1925 figures. The company paid an interim dividend of 5 per cent. and a final at the same rate, the latter on the capital that had been increased by £1,770,000 by the capitalisation of reserves and distribution of these in the shape of ordinary shares, the price of which is better at 28s. The Westminster Electric Supply Corporation's net revenue of £137,000 is £35,000 less than that of 1925. The total dividend on the ordinary shares for 1926 took £110,800, against £113,300 required for the payment of 3s. a share on the ordinary in 1925. The Charing Cross Electricity Supply Company makes up its standard dividend for the year in accordance with the London Electricity No. 2 Act.

The County of Durham Electrical Power Distribution is paying 6¾ per cent. on the ordinary shares, against 6 per cent. a year ago. The Telegraph Construction and Maintenance Company increased its profit last year, but the dividend is retained at 10 per cent., tax free. British Insulated Cables made a gross profit of £607,900 last year, which goes against £670,300 for the previous twelve months. The dividend of 15 per cent. is repeated. This time, however, there is much more capital than there was a year ago. The Midland Electric Corporation for Power Distribution reports a net profit of £163,500, being about £10,000 lower than that made in the corresponding period. The ordinary dividend of 15 per cent. is maintained, with the addition of 1s. 4¼d. per share on the new shares. India Rubber preference eased off to 15s.

Automatic Telephones are dull at 53s. 3d. sellers, the previous dividend of 10 per cent. being repeated. The net profit of £161,500 is £1,800 down as compared with 1925. International Telephones keep steady at 43s. for the deferred. Dividends of 10 per cent. on these and on the ordinary are declared. Bogota Telephones at 31s. 3d. have acquired a small rise upon declaration of a 5 per cent. interim dividend. Monte Video Telephones at 35s. and United River Plates at 8¾ are both better than they have been. The cable group is lacking in features.

St. Maurice preference are good at 20s. South Wales Power 6½ per cent. preference rose to 17s. 6d. The rubber share market is not quite so good as it was last week. Business has fallen off to some extent. Engineering shares hold their ground, but iron and steel descriptions manifest a disposition to droop for want of public interest.

U.S.A. Electrical Exports.

Figures for 1925 and 1926 compared.

BELOW are shown the values of electrical machinery and apparatus exported from the United States during the 12 months ended December last. Comparative figures for the year 1925 are added, and notes of increases or decreases are also given :—

	1925. Thousands. $	1926. Thousands. $	Inc. or dec. Thousands. $
Electrical machinery and apparatus (total)	73,790	84,226	+10,436
Generators—			
Direct current—			
Under 500 kW	848	960	+ 112
500 kW and over	428	455	+ 27
Alternating current—			
Under 2,000 kVA	303	188	− 115
2,000 kVA and over... ...	1,901	1,273	− 628
Steam turbine generator sets	796	1,412	+ 616
Accessories and parts for generators	1,089	920	− 169
Self-contained lighting outfits	1,076	1,151	+ 75
Batteries—			
Flashlight batteries	1,214	1,674	+ 460
Other primary batteries ...	1,204	2,020	+ 816
Storage batteries	2,683	3,443	+ 760
Transforming or converting apparatus—			
Power transformers	2,175	2,231	+ 56
Other transformers	1,315	1,266	− 49
Rectifiers, double-current, and motor generators, dynamotors, synchronous, and other convertors ...	967	1,557	+ 590
Transmission and distribution apparatus—			
Switchboard panels, except telephone	2,305	2,193	− 112
Switches and circuit breakers over 10 A	2,424	2,618	+ 194
Fuses and fuse blocks ...	343	352	+ 9
Watt-hour and other measuring meters	447	493	+ 46
Volt, watt and ampere meters and other recording, indicating and testing apparatus	1,696	2,152	+ 456
Lightning arrestors, choke coils, reactors and other protective devices	707	709	+ 2
Motors, starters, and controllers—			
Motors under 1 h.p.	2,102	1,200	− 902
Stationary motors—			
1 to 200 h.p.	2,472	3,207	+ 735
Over 200 h.p.	604	884	+ 280
Railway motors	808	1,127	+ 319
Electric locomotives—			
Railway	482	1,842	+1,360
Mining and industrial ...	331	759	+ 428
Starting and controlling equipment			
For industrial motors ...	1,159	1,395	+ 236
For electric railway and vehicle motors	278	203	− 75
Accessories and parts for motors	2,040	2,181	+ 141
Electrical appliances—			
Electric fans	917	948	+ 31
Electric lamps—			
Metal filament	1,250	1,603*	+ 353
Other electric lamps	244	281	+ 37
Flashlights	1,342	2,058	+ 716
Searchlights and projectors	562	574	+ 12
Motor-driven household devices	1,206	1,744	+ 538
Domestic heating and cooking devices	1,340	1,722	+ 382
Industrial electric furnaces and ovens	252	253	+ 1
Therapeutic apparatus, X-ray machines, galvanic and faradic batteries, &c. ...	1,415	1,478	− 63
Telephone apparatus—			
Magneto telephones	125	105	− 20
Other telephones	498	332	− 166
Telephone switchboards ...	799	2,219	+1,420
Other telephone equipment ...	2,298	2,468	+ 170
Railway signals, switches, and attachments	803	505	− 298
Bells, buzzers, annunciators and alarms	171	296	+ 125
Signal and communication devices—			
Radio apparatus	9,904	8,794†	−1,110
Telegraph apparatus	497	1,018	+ 521
Other electrical apparatus—			
Spark plugs, magnetos, and other ignition apparatus ...	2,708	1,904	− 804
Insulating material	1,545	1,380	− 165
Metal conduit, outlet, and switch boxes	797	1,164	+ 367
Sockets, receptacles and lighting switches	1,595	1,718	+ 123
Electric lighting fixtures, interior and street	1,314	1,860	+ 546
Other wiring supplies and line material	1,132	1,164	+ 32
Other electrical apparatus ...	6,883	7,423	+ 540
The following, not included in the total of electrical apparatus, were also exported :—			
Insulated iron or steel wire or cable	268	276	+ 8
Insulated copper wire or cable	4,900	4,816	− 84

* These were distributed as follows :—Europe, $61,000; Canada, $16,000; Central America, $79,000; Mexico, $267,000; British West Indies, $26,000; Cuba, $184,000; Argentina, $205,000; Chile, $116,000; other South American countries, $202,000; Australia, $188,000; New Zealand, $43,000; British South Africa, $44,000; other countries, $116,000.

† Included in 1926: Transmitting sets and parts, $556,000; Receiving sets, $2,874,000; Valves, $868,000; Receiving set components, $2,016,000; Receiving set accessories, $2,481,000.

Indian Electrical Imports.

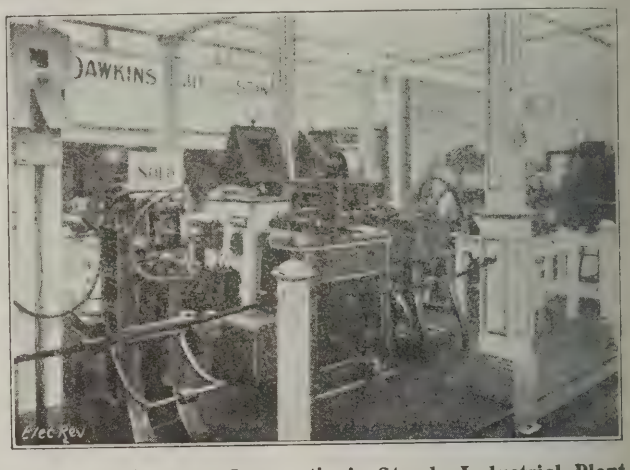
THE Trade Commissioner at Calcutta (Mr. D. M. Clarke) has forwarded to the Department of Overseas Trade a survey of the import trade of India during the period from April 1st to December 31st, 1926.

In the course of this it is stated that the imports of electrical machinery were valued at Rs. 173 lakhs, as compared with Rs. 147 lakhs in the corresponding period of 1925. Boiler imports are given as 50 lakhs, against 73. In electrical machinery the United Kingdom imports increased from 120 lakhs to 140 lakhs, and those from the United States from 11 lakhs to 16¼ lakhs. The majority of the boilers were from the United Kingdom, her imports during the two corresponding periods of 1925 and 1926 being 65 lakhs and 48 lakhs respectively. With regard to other electrical goods, the position is shown in the following table :—

	1925-26. Rs. lakhs.	1926-27. Rs. lakhs.
Electric fans and parts	19	22
Electric wires and cables (rubber insulated)	30	23½
Electric wires and cables (other)	14½	20½
Bare copper wire (electrolytic) (other than telegraph and telephone wires)	11½	14
Telegraph and telephone instruments ...	5½	2½
Electric lamps and parts	14½	14½
Electric lamps (other sorts)	3	9
Electric lamps (parts and accessories) ...	2	6½
Batteries	7	7½
Accumulators	8½	11
Electric lighting accessories and fittings ...	13	11
Electric meters	5	4
Electrical instruments, other sorts	3½	2½
Switchboards	2½	3
Electrical goods and apparatus not enumerated	25½	28
Wireless apparatus	5	4

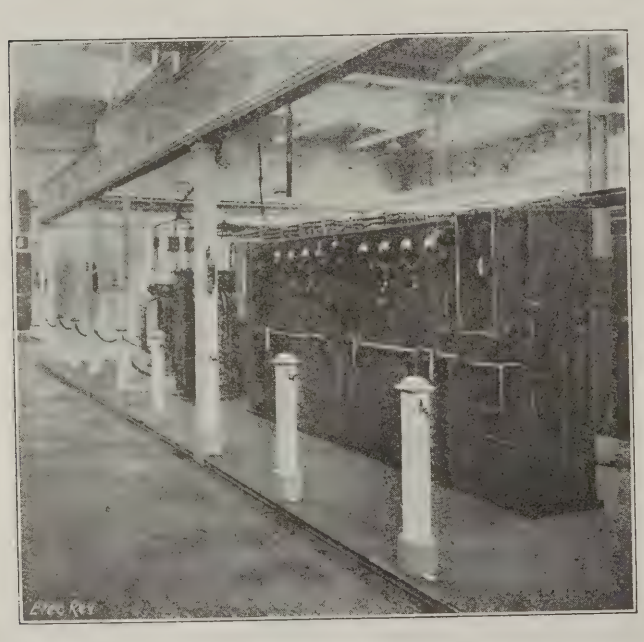
The increase in the imports of electric fans is due to increased shipments from the United Kingdom, whose share rose from 11½ lakhs to 14½ lakhs. In electric wires and cables the United Kingdom supplied 21¾ lakhs. Of the trade in electric wires and cables, insulations other than rubber, the United Kingdom supplied 90 per cent. of the imports. In bare copper wire 10½ lakhs came from the United Kingdom; the United States provided the majority of the remainder, a portion of it being in connection with the electrification of the Bombay, Baroda and Central India Railway. Of the 2½ lakhs for telegraph and telephone instruments, over 2 lakhs came from the United Kingdom. In electric lamps, the United Kingdom's imports increased to 5½ lakhs; the Netherlands supplied the second largest total, 5 lakhs. In electric lamps, other sorts, the United States supplied over 7½ lakhs, the United Kingdom's share being only ½ lakh. The United Kingdom's share of batteries was 2½ lakhs, and the United States' 3½ lakhs. Of the import of accumulators, 90 per cent. came from the United Kingdom. In electric lighting accessories and fittings, the United Kingdom supplied 7¾ lakhs and Germany 2¼ lakhs. In meters the United Kingdom supplied 3½ lakhs, 85 per cent. of the total imports. Practically all the switchboards came from the United Kingdom. Of wireless apparatus the United Kingdom supplied 3½ lakhs.

The British Industries Fair.—V.



Exhibits at Birmingham.

In this issue we conclude our notes upon the Birmingham section of the British Industries Fair, and in doing so reproduce photographs of the stands of two regular exhibitors.



The first three views show the display of the Birmingham Corporation Electric Supply Department, which was bigger than ever this year. The first picture is a general view of the exhibit which comprised all kinds of domestic and industrial appliances. The second illustration shows welding plant, representing the industrial section. The third view is of a separate stand upon which a working sub-station was erected

The Birmingham Corporation's Stand—Domestic End.

The Birmingham Corporation's Stand—Industrial Plant.

The Corporation's Sub-Station.

Display by Premier Electric Heaters, Ltd.

for dealing with the Fair electricity supply; here are seen the control panels of the 460-kW mercury-arc rectifier sub-station and part of the bank of three 100-kW transformers. Apart from being an interesting exhibit in itself, the sub-station served a useful purpose in supplying energy to the exhibitors, whose requirements now exceed the capacity of the plant installed by the Fair authorities for the purpose of lighting the building and demonstrating machinery, &c.

The other illustration shows the comprehensive nature of the domestic appliance exhibit arranged by Premier Electric Heaters, Ltd. This, too, surpassed the company's previous efforts, and was a very bright and stimulating display.

Electric Transmission, Ltd.

This exhibit was divided into three groups, which readily represented the company's products. These were overhead transmission line material: transformer terminals; and outdoor pole-top switchgear. All the porcelain shown by the company was manufactured by Messrs. Taylor, Tunnicliffe & Co., Ltd. In the first group, pin and cap and pin-type insulators used on overhead construction were shown. The pin-type insulators are fixed to their spindles through a neat thimble, which ensures that the porcelain will not be subjected to the internal expansion stresses produced on the materials by variations of temperature. The spindle head has a specially rounded thread to obviate damaging the thimble on the one hand, and the creation of corona, due to sharp points within the porcelain hole, on the other. The cap and pin-type insulators have also been expressly designed to protect the porcelain against expansion stresses, and they can be used for the highest voltages. For heavy mechanical loadings strain insulators are supplied with a clamp, which is suitable both for copper and aluminium steel core conductors. In the second group two specific designs were shown: All-porcelain terminals for voltages up to 33 kV, and condenser-type terminals for voltages from 33 to 66 kV. The condenser-type terminal is a joint product of the company and Micanite and Insulators Co., Ltd. No compound is used in the air-filled terminals, but nevertheless corona is neither apparent or audible until voltages well above the working pressure have been reached. The terminals are guaranteed hot-oil tight. The condenser-type terminals are noticeable for the small amount of compound used, the porcelains being specially manufactured to ensure a close joint between the paxolin—the upper portion of which is cylindrical—and the porcelain. The condenser-type terminal is also hot-oil tight, its puncture value being exceedingly high. In the outdoor pole-top switch

gear group there were three chief exhibits: rod-operated isolating switches, remote-control isolating switches, and air-break switches. The rod-operated isolating switches have a springless main locking device, which prevents the blade opening under the influence of electro-magnetic forces. The remote-control isolating switches incorporate a square operating bar instead of the conventional tube, this ensuring positive and simultaneous movement of the blades, and the operating mechanism is adjustable. The operating mechanism of the air-break switch is similar to that of the remote-control isolating apparatus. The blades are opened by means of rocking insulators, thus eliminating any torsional stresses between the porcelain and the pin. The rocking insulator is connected to the blade by means of a link combination, which imparts a rapid movement to the blade; an ice-breaking mechanism is also incorporated.

George Nobbs, Ltd.

On this stand was exhibited a range of the latest models of the instantaneous-type water geysers as designed to meet the I.E.E. regulations. In these a separate switch and water valve are provided for fitting, particularly in the case of the bath geyser, in a position out of reach of persons standing in the bath. The larger sizes are built for medium voltages divided into two equal circuits and for three-wire d.c. up to 600 V, or they may be divided into approximately three equal circuits with a triple-pole switch for three-phase working. An interesting line displayed was the "Genii P.S." water heater, which has been designed for use in places where a geyser is not practicable. The water valve is fitted on the cold-water side of the heater, for which the makers claim many advantages, the principal of which is that the heater cannot be subjected to the pressure of the water mains. No air or steam vent is necessary, neither can any steam pressure be set up in the tank. The tank is of light construction and fitted with a loose cover. It is supplied in various sizes to give any hot-water storage capacity. An exhibit of special interest was the "Genii" electric urn for boiling water. This is designed for use in bars, canteens, hairdressers' and other places where a constant supply of hot water is required. It is strongly made and finished, constructed of copper, polished outside and tinned inside. A lever draw-off tap, a top cover, lifting handles, and immersion heater loading with 98 per cent. efficiency are fitted. Somewhat similar are the "Genii" jar-lined urn and the "Genii" rectangular-type water boiler for fixing to a wall or bulkhead. Other exhibits included the "Genii" electric hot-water radiator and the "Genii" electric hot-water towel rail and rack. The latter has been constructed to meet the demand for a low-priced article, and is made in two standard designs and lengths. The first has a solid crystal rod with nickel-plated brass end brackets and a nickel-plated tubular heater 24 in. in length. The second is of similar design, only 36 in. in length. Both may be safely used on the ordinary electric light circuit, the consumption being very low.

Bromford Tube Co., Ltd.

This company exhibited a range representing all classes of weldless steel tubes from 10-in. bore down to ¾ in. in lengths up to about 45 ft. Of interest were the specimens of metalised tubing, a process for coating tubes both inside and out, the thickness of the coating being anything between a few thousandths and 1/16th of an inch.

Henry Wiggin & Co., Ltd.

Many types of wire were shown upon this stand, and element wires for electric fires were given prominence by being shown in use in "Creda" and "Belling" fires.

British Electrical Repairs, Ltd.

Examples of re-wound electrical machinery formed the bulk of this exhibit. Commutators, armatures, field coils, &c., were shown.

Ad-Shades, Ltd.

A large collection of art shades (silk, parchment, and composition) was exhibited by this company. All of these reached a very high standard of design.

Mersey Cable Co., Ltd.

Disposed about this stand were a number of drums bearing samples of the company's cables, in addition to sections and lengths of wires and cables upon showboards.

Porcelain Electrical Fittings Association.

This Association had a large combined stand upon which were displayed porcelain electrical parts of all kinds made by its members.

Wilkins & Wright, Ltd.

Numerous examples of brassware for electric lighting were shown by this company, including canopies, chains, bowl rings, &c. In addition, complete radio sets ("Utility") and components were displayed. The latter included triple condensers, micrometer dials, plugs and jacks, &c.

P.I.V. Gear Syndicate, Ltd.

Upon this stand were exhibited examples of drives incorporating the company's positive infinitely variable gear. In essence this gear comprises two cones upon a shaft, which can be moved towards or away from each other. The inner faces of these cones slope inwards towards the centre and are radially slotted. A special form of belt employed has steel slatts running transversely through the links, and these engage with the slots in the pulley cones, giving a positive drive. A simple arrangement is provided for moving the cones so gradually as to give an almost imperceptible change of speed.

Lea Recorder Co., Ltd.

Among this company's exhibits were "V"-notch recorders for boiler-feed water and condensate. "Cubi-meters" for measuring coal were also on view. These embody an adaptation of the "V"-notch principle, but in the place of a float a swinging door is fitted to operate the recording mechanism, and the flow of water is replaced by an endless belt which conveys the coal through the aperture beneath the door. When the flow of coal ceases the door falls and cuts out the recording mechanism.

Bull Motors, Ltd.

The main exhibit upon this stand was a portable arc-welding set consisting of a motor-generator and switchboard mounted on a trolley. The design of the generator eliminates wasteful resistances in the arc circuit, and it is claimed that the standard 25/200-A set takes only 8 h.p. when loaded to its maximum. Other exhibits were a 2,400-V a.c. generator for marine radio transmission and examples of the company's industrial motors. A collection of photographs indicated the range of the company's activities, which include the manufacture of valve filament lighting dynamos, trolley 'bus motors, 1,000-cycle, single-phase alternators for radio purposes, organ-blowing equipment, &c.

Upon the same stand appeared a new "Brookhirst" combined motor switch and controller and an "Airedale" star-delta starter.

Premier Electric Heaters, Ltd.

This company, as usual, had an excellent display of its fires and domestic appliances. All of these were notable for their excellent finish in addition to their working qualities. Fires, irons, urns, kettles, saucepans, hot-plates, and small cooking apparatus formed the bulk of the exhibit. Special interest was displayed by visitors in the company's safety device for electric kettles and similar apparatus. This consists of a metal bridge which is maintained across the contacts in the bottom of the kettle by a nut fitted with a split sleeve. This sleeve becomes overheated when the kettle boils dry and falls apart allowing the bridge to fall and break the circuit. A new sleeve can be fitted in a few moments.

Lightfoot Refrigeration Co., Ltd.

The examples of its work shown by the company were an "Ellarcold" automatic refrigerator in operation cooling a cabinet of 20 cu. ft. capacity; and another set combined with an ice-making tank. The latter plant is driven by a 1-h.p. motor, and is capable of operating an 800 cu. ft. capacity chill room.

May & Padmore, Ltd.

Among the electric fires shown was a new imitation coal fire fitted with two 1,000-W bars in the front, and finished in oxidised silver. There were also a number of bowl fires and soldering irons, and a new curling-tong heater.

Estler Bros.

This firm showed typical low-voltage electric furnaces for industrial processes requiring temperatures up to 1,100 deg. C. In these is incorporated a transformer which reduces the pressure to between 3 to 6 V, and the elements, instead of being fine wires as usual, are of heavy sheet steel, ensuring better distribution of heat and longer life. The furnaces can be fitted with automatic heat control.

Castle Fuse and Engineering Co., Ltd.

The exhibit of this company comprised a range of eight "Triumph" fuses for currents of from 5 to 300 A. These can be arranged for switchboard mounting or fitted into iron cases. The company also showed various examples of fuse unit assemblies from small distribution boards to heavy triple-pole ironclad boxes for industrial service.

Thos. De La Rue & Co., Ltd.

Upon this stand were shown numerous examples of moulded insulating material, including fireproof articles.

Other Exhibitors.

In addition to those firms which we have mentioned in this and previous issues there were a number of exhibitors who showed one or two electrical or allied items. Such were the Stainless Iron and Alloys Co., Ltd. (electric fires and an electric cooker in stainless iron); John Harper & Co., Ltd. (electric heater); James Smellie, Ltd. (lighting fittings); A. Bell & Co., Ltd. (electric fire); Scupham & Wood, Ltd. (wooden electrical accessories); Mond (Staffordshire) Refining Co., Ltd. (joint box compounds); Ryder & Davidson (small geared motors); C. & J. Swingler (bowl chains and fittings); Davis & Timmins, Ltd. (screws and terminals); Joshua Buckton & Co., Ltd. (armature balancing machine); the Silglas Co. (shades); Phillips & Day, Ltd. (lighting standards); and Smalls, Ltd. (mica products).

Illuminating Engineering.

Conditions governing good lighting: some street-lighting problems.

(*Résumé of Proceedings before the* Institution of Electrical Engineers.)

(*Concluded from page* 412.)

At the ordinary meeting of the Institution of Electrical Engineers on March 3rd, two papers relative to the above-named subject were presented. An abstract of Mr. J. W. T. Walsh's paper, together with a report of the discussion on both, was published in our issue of March 11th. The other paper is dealt with below.

Public Lighting.—(*Abstract.*)

By Lieut.-Com. Haydn T. Harrison, R.N.V.R., M.I.E.E.

The demands of modern civilisation are such that the height, spacing, and position of light sources should be re-arranged to avoid the use of very brilliant light sources and to reduce obstructions to vehicle and pedestrian traffic which are liable to endanger the safety of the public. Examples of overhead suspension and of the usual method of supporting by means of columns are cited, with the object of comparing them with the suggested solution of the problem.

High-class Thoroughfares.—It is a mistake to attempt to attain by increasing the power of the existing light sources the high degree of illumination now demanded, as these light sources would need to be too brilliant to be pleasant and would in many cases defeat their own object by reducing visibility, on account of glare. The solution of the problem lies in the use of gasfilled electric lamps.

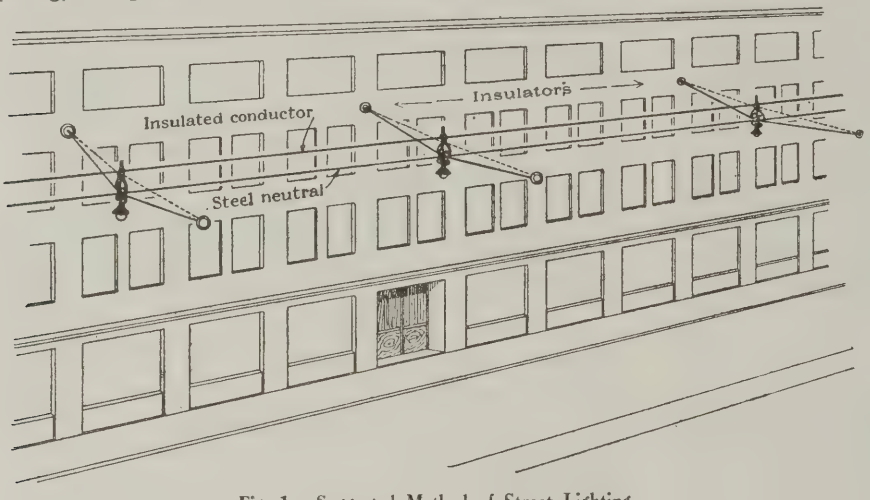


Fig. 1.—Suggested Method of Street Lighting.

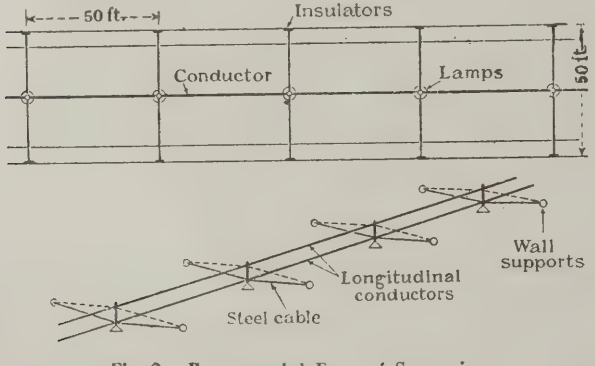

Fig. 2.—Recommended Form of Suspension.

That a completely new system must cost more to install than to convert the existing light sources, need not necessarily be the case; but, even if it should be so, the economies resulting from the more simple control and reduced cost of maintenance will more than compensate for the increased capital charges.

Buildings on either side of the street form a natural fixing for suspension. Where such buildings do not exist, or are unsuitable, steel columns set back from the road against the frontage, or in place of the buildings, would be inconspicuous and free from obstruction. Difficulties in the way of obtaining permission for fixings on privately-owned property are rare in shopping districts where improved lighting will benefit trade; there should therefore be no difficulty, with the help of the Electricity Commissioners, in obtaining Parliamentary powers to prevent permission for such fixings being unreasonably withheld.

A sample installation is diagrammatically illustrated in fig. 1, in which the buildings on one side only are shown. The form of suspension recommended is shown in fig. 2, but, if desirable to reduce the number of fixings to one-half, that shown in fig. 3 could be adopted. The steel span wires, guy wires, and longitudinal wires are insulated where attached to the buildings, or other supports, being earthed only at the switch, or feeding point, and thus become the neutral, or earthed, conductor of the system. The insulated conductor, which is threaded through reel insulators at each fitting and passes longitudinally down the centre of the street, does not carry any weight beyond its own. Where the streets bend, guy wire of small section can be taken from the top of the fitting to a wall fixing away from the centre of curvature; should it be advisable for appearance, this may be done on both sides as shown by dotted lines in figs. 1 and 2, without appreciable extra expense to all spans, in order to make the point of support of the conductor more rigid. Such guy wires do not take any weight and can therefore be of very small section. The terminal ends are guyed in the usual manner from a further point on both sides, and a large factor of safety is ensured owing to the light weight of the fittings to be suspended and to the large sag which is allowed, any swinging being prevented by the longitudinal wires and conductors; a sag in the supporting span wires of as much as 10 per cent. of their length does not adversely affect the appearance.

In the case of 50-ft. spacing with approximately 50-ft. spans, 25 ft. high, allowing for fittings weighing 20 lb. and conductors for a 1,000-ft. run with a voltage-drop of 5 per cent. when using 500 watts per fitting at 200-240 volts, the strain on any fixing will not exceed 100 lb. and, with a safety factor of 10 on the span wires, the outside diameter of any wire would not exceed 0.3 inch. The electrical details described above allow for the guard wire shown in fig. 2 to be of copper, as it acts as the neutral or earth-return conductor and is therefore of the same conductivity and resistance as the insulated main. If the construction shown in fig. 3 is used, this wire can be dispensed with, or reduced in section, depending on the area and conductivity of the diagonal span wires, which then become conductors.

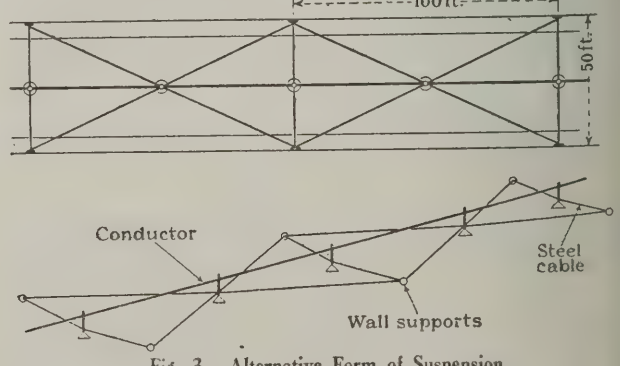

Fig. 3.—Alternative Form of Suspension.

The illuminating problem is simple, the distribution of light being arranged for in accordance with the ratio of the spacing to the height, as in an ordinary factory bay or elongated area. The use of diffusing globes is a matter of taste, as the height proposed is sufficient to keep the light sources well out of the field of vision. Due to the number of

supports, any likelihood of a live wire falling is a very remote contingency, and as they are insulated with a permanently flexible medium, no danger would result. Nevertheless, should it be advisable No. 16 s.w.g. copper catenary wire can be used between the live conductor and the guard wire at intervals.

The attention necessary for such an installation becomes a relatively small item of cost. Modern gasfilled electric lamps only require renewal two or four times per annum, depending upon the efficiency at which they are operated; cleaning, except where the atmosphere is heavily laden with smoke and dirt, is generally carried out 12 times a year. Access to the light sources should be gained by means of electrically-propelled and operated battery tower wagons especially designed for the purpose. The cleaner, without lowering the platform, could move from lamp to lamp, and it is estimated that one man could deal with an installation of 1,000 lamps at the spacings suggested (or even when spaced at 100 ft.), which represents a total cost of attention not exceeding 4s. per lamp per annum.

The cost of lighting and extinguishing becomes negligible where the lamps are controlled on the group system by time switches, or by the police, as one switch can be made to deal with many hundreds of lamps if relays are introduced at the feeding points.

It has been stated that an average life of 2,000 hours can be obtained by operating lamps at a pressure 5 per cent. below that marked on them, but this would result in a reduction of nearly 20 per cent. in the candle-power (with high-power lamps); thus the energy should be increased by that amount. With electrical energy below 1½d. per unit a saving would still be effected. When lamps are allowed to burn out at various times, the labour cost of renewal is increased, as a greater number of special visits has to be made for that purpose, and noticeably irregular lighting results, owing to the great variation in candle-power often found between two adjacent light sources, due to one being new and the other of extreme age.

Light diminution causes include the following:—

(1) Original tolerances allowed to lamp manufacturers by the B.E.S.A. Specification; reduction of 12.5 per cent. (2) Decrease in power during 1,000 hours; reduction of 10 per cent.

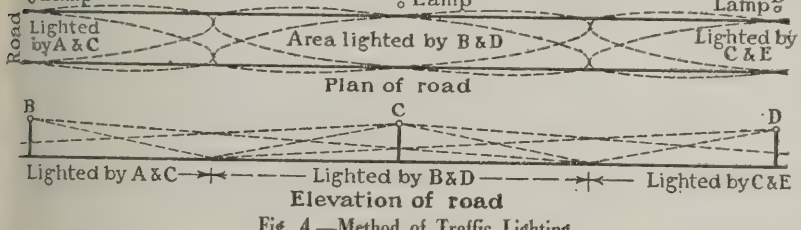

Fig. 4.—Method of Traffic Lighting.

(3) Reduced pressure at point of connection (4 per cent. allowed) causing reduction of light, say, 10 to 16 per cent. (4) Absorption of light by dirt up to, say, 25 per cent. If all these factors were to operate adversely to their maximum extent at the same time, the illumination would be reduced by over 50 per cent. Fortunately such a contingency does not often arise, but a reduction to from 60 to 70 per cent. of the designed illumination is not uncommon and should be allowed for.

The prime cost of an installation such as that described by the author, including all the necessary materials, and erection, is as follows:—

(a) Minimum 1 foot-candle ... ... £650 per mile.
(b) Minimum 0.5 foot-candle ... ... £575 per mile.
(c) Minimum 0.25 foot-candle ... ... £525 per mile.

When fixings cannot be obtained on buildings, steel poles can be of relatively small dimensions if guyed outside the limits of the street, and the increased cost would probably not exceed 50 per cent. Maintenance and operating costs, including electrical energy at 1d. per unit, four lamp renewals per annum, lighting and extinguishing, cleaning, interest and sinking fund on a 10 years' loan basis are approximately:—

(a) Minimum 1 ft.-candle ... £1,000 per mile per annum.
(b) Minimum 0.5 ft.-candle ... £600 per mile per annum.
(c) Minimum 0.25 ft.-candle £475 per mile per annum.

Comparison with existing practice shows that for the same standard of illumination the operating cost above-mentioned would be little more than that required to cover the interest and sinking fund, despite the fact that these do not include the mains.

Less Important Thoroughfares.—The problem of side streets, residential streets, roads used for traffic, country-town and suburban districts and the numerous slums in all large towns is, in the author's opinion, by far the more important, not only on account of its magnitude, but because it affects the safety and to a large extent the welfare of the masses.

Side streets, lanes, alleys and slums can all be dealt with on the lines suggested for the better-illuminated streets, as they are generally narrow and the buildings eminently suitable for fixing. The minimum degree of illumination to be aimed at should not be less than 0.1 foot-candle, which could be obtained by light sources spaced 100 ft. apart and 25 to 30 ft. high, and consisting of 100-watt lamps in suitable reflectors. The capital cost of such an arrangement, based on switch feeding points at half-mile intervals, would not exceed £450 per mile, including conductors. The operating charges, allowing for repayment of the loan in 10 years and 1d. per unit for the supply of energy, would work out at approximately £165 per mile per annum, or probably much the same as the present form of "beacon" lighting giving a minimum illumination of 0.0015 foot-candle, *i.e.*, practically darkness between light sources.

The middle-class residential districts and suburbs are more difficult to deal with, owing to the buildings being set back from the road; this problem should be dealt with in conjunction with the private supply, as the decision may rest upon the suitability of the underground or overhead system, bearing in mind that developments in this country tend towards a.c. distribution, in which case overhead conductors have many advantages when dealing with this class of district.

If existing lamp posts and lanterns must be used, it is imperative in the majority of districts that their numbers should be doubled in order to reduce the spacing to a reasonable limit, and that the most powerful light sources permissible, considering the low height, be introduced. The cost of the change will, however, probably exceed that of a complete new installation on modern lines.

Traffic Lighting.—High roads, arterial roads, and those used by modern high-speed traffic through rural districts, require consideration on account of the danger they represent to the public.

The author has carried out many tests on the "beam" method of traffic lighting, in order to investigate the proposals published in his paper on "Street Lighting" before the National Illumination Commission at Geneva in 1924, in which he suggested that the source of illumination should be rigidly fixed below the level of the eye in order to prevent glare completely by removing the lamps from the field of vision. The result fulfils all the requirements scheduled by the authorities who have issued regulations on the subject of headlights, but the effect on the public is so extraordinary that it is doubtful whether the method will ever become popular.

From research and the regulations already published and adopted for motor-car lighting, it would appear that in order to preserve the safety of the public as one approaches a light source its power should be reduced and the illumination on the obstruction remain the same.

A solution of the problem is to use, say, 30-ft. high light projectors rigidly supported on the sides of buildings or poles carrying the necessary overhead conductors. These may be spaced at distances, say, of 300 ft., or from 17 to 20 to the mile. To produce an illumination of 0.25 foot-candle on a vertical object at any part of the road the maximum candle-power would need to rise to about 40,000 at a distance of from 300 to 400 ft., which does not cause inconvenience. The power would be diminished at 250 ft. to 16,000 candle-power, and at 150 ft. to 6,000 candle-power; and at 100 ft. it would fall to zero, as the light from the source beyond the adjacent one comes into operation. The lamps and reflectors would be of the motor-car headlight type, easily constructed and maintained. The result required can be obtained without difficulty by using 50-watt lamps of low voltage (say, 10 to 12 volts), of which there would be two at each support, or a total of 100 watts, *i.e.*, say, 2,000 watts per mile.

The capital cost, including overhead mains and pole supports, would not exceed £300 per mile, the cost of electrical energy at, say, 1d. per unit being £35 per mile per annum. The cost of lamp maintenance is difficult to estimate, as 10-12 volt 4-ampere lamps are not largely used at the present time in this country, but there is no reason to suppose that it would exceed £2 per point, or £40 per annum, and might not reach half that figure.

With d.c. the lamps would need to be in series of approximately 20 on the 200-240 volt circuits. With a.c. separate 100-watt transformers or compensators wound for a high efficiency at a constant full load could be used, thus making it possible to vary more easily the number of lamps on one circuit. The general principles are illustrated in fig. 4, from which will be noted the effective means of overcoming glare.

Open Spaces, &c.—For lighting open spaces, parks, bridges, &c., the use of underground conductors is generally essential, and, with the exception of bridges, all-round light distribution is required. For open spaces of large area the best effect can be obtained with powerful light sources on very high standards.

State Inspection of Dams.

As the result of investigations and suggestions which have been made consequent on the failure of the Dolgarrog dam, North Wales, last year, a Bill has been drawn up and presented by Major Owen to the House of Commons. The Bill provides for the inspection at any time by the Secretary of State of any dam, embankment, or reservoir in the country, either during the course of construction or when completed. Further, in the event of any dam, &c., being found defective, the owner is to be called upon, under penalty, to remedy the defect.

The Electrical Production of Steam.

The economic production of steam by electric boilers is possible when the cost of electricity is low: 200 installations are believed to be in operation at high efficiency, giving satisfaction.

(Abstract of Paper read before the INSTITUTION OF ENGINEERING INSPECTION.)

AT a meeting of the Institution of Engineering Inspection, held in London, on February 25th, Mr. C. J. Wharton, O.B.E., M.I.E.E., read a paper in which he showed that it was a commercial and economic proposition—under certain circumstances—to generate steam by electricity. The conditions required were very cheap electricity, all machinery in the works electrically driven, and yet a quantity of live steam required for process purposes in the mill or factory. The inventor of one type of electric boiler had suggested as a formula that where electricity could be obtained per kilowatt-hour at a price equal to from one-third to one-fourth of the cost of a kilogram of coal, electrical production of steam began to be economic. Translated into English terms, the author put it roughly that where coal was 30s. per ton and electricity 0.1d. per unit, coal *might* economically be displaced by electricity for the production of such steam as was required for purposes other than power; but undoubtedly every case required individual investigation.

Last year the proposition was put before him by clients in South America that for approximately 10 hours out of the 24 they used from 1,000 to 1,500 kW less than their average load, and that the bulk supply company was prepared, if the consumers could fill up this valley in the load curve, to supply energy at a price of between 0.07 and 0.08d. His clients took into their works continuously several thousand kW at 6,000 volts, 50 periods, the greater part of it being transformed on the premises to 400 volts. Their power was all electrical, but they required for the manufacture of one of their products a quantity of steam amounting to 20,000 lb. per day, and this amount was likely to be doubled. It was required at a pressure of between 10 and 20 lb. Fuel, however, was very expensive, and it was a question whether it would be possible to substitute electricity for the fuel.

Such figures for electricity as those mentioned above were not obtainable in this country, but he had found that the subject had been fully worked out in Sweden and Germany, and to some extent in Canada, Switzerland, and Italy. Numerous works in the first-named two countries were using electric boilers with complete satisfaction. The London representatives of the makers of the Swedish and German systems had held out the promise of such performances as were almost impossible to believe without personal investigation, and he had decided that the systems should be inspected, and that the users should be asked to give their views. All the statements made by the manufacturers were borne out by the users; the extraordinary efficiency, the ease of working, the absence of any injurious effects on the boiler itself, and the general perfect satisfaction experienced by the users were most surprising. Nearly every engineer in charge of an electric boiler, whether it had been working two, three or four years, emphatically declared that he had no maintenance charges whatever. The author had inspected an installation at Freiburg, with regard to which the City Engineer, Mr. E. Eitner, had stated that it had fully justified the expenditure and had proved a great commercial success, that the upkeep costs of the boiler had been absolutely nil, and that the boiler worked silently and gave no trouble to the supply circuit, the loading of the three phases being perfectly balanced. The only exception to the "no costs" reports met with was in the case of a pulp mill at Gota, Sweden, where a bank of three large boilers, each taking 3,000 kW, was working at 10,000 volts, and, with the exception of two weeks in each year, had been running at full load for 24 hours a day for four years. The only renewals in that time had been some electrodes and a few porcelain parts; this was considered by the user to be highly satisfactory under such severe conditions. The boiler shells showed no trace of pitting or corrosion.

The underlying principle of the two systems of boiler was the same, *i.e.*, the boiler, relatively to the output, was a small one of vertical type, with three iron electrodes immersed in water, and three-phase current at 3,000 to 10,000 volts was applied, the water itself being the resistance whence the heat was obtained. The details, however, varied considerably.

In the Swedish, or "Volta," type the water level in the boiler was kept uniform, and variations according to input of electricity and output of steam were obtained by raising or lowering vertical tubes surrounding the electrodes, which shortened or lengthened the path of the current, the entry of the conductors in this case being through the bottom of the boiler to vertical electrodes fixed to the base of the shell.

In the "Penzold," or German, system the leads were brought in through the top, and hanging electrodes were used with piled disks of insulating material surrounding them to direct the course of the current, while the work done was varied by raising or lowering the water level. Both systems might be made wholly automatic or might be hand-controlled.

In practice he could find no difference in the satisfaction given to the user, that satisfaction being based upon (1) the very high efficiency of conversion; (2) the extreme cleanliness of the operation; (3) the small space occupied for a large output; (4) the complete automatic possibilities, reducing attendance costs to almost nothing; (5) the virtual absence of repairs, maintenance and depreciation.

The efficiency claimed was nearly 100 per cent., as practically every kWh expended was returned in B.th.u., the only loss being the heat lost by radiation. This loss could be brought down to the lowest dimensions by thorough lagging of the whole of the boiler, and the makers guaranteed an efficiency of 96 per cent. There was a further loss, however, due to blowing-off the mud deposited from the impurities in the water. It was essential, of course, that the conductivity of the water should remain constant. Perfectly pure water could not be used, in view of its high resistance; a certain amount of impurity was necessary, but as this did not pass over with the steam, the conductivity of the water gradually increased, so that it was necessary to blow out the surplus and keep the water in the boiler at approximately uniform analysis. The net result was that with feed water at 68 deg. F., one kWh would produce 2.75 lb. of steam at a gauge pressure of 114 lb., and the installation with which he was concerned was guaranteed to do that. Similar results had been obtained in other plants which he had seen working on the Continent.

Dealing with the space occupied, he referred to a case in which three Lancashire boilers were supplying a large building with steam. The building was owned by the municipality which also owned the electricity supply system; whenever current could be spared the electrical system was used, and was greatly preferred. The comparison between the two with regard to space required was significant, for the electric boiler occupied a space in the corner not more than 7 ft. by 7 ft., including switchgear and everything else, and it did the same work as the three Lancashire boilers.

The manufacturers of the Swedish and German plants had worked out very complete automatic systems for regulating the input of electricity and/or the output of steam, and no attendance was required for hours at a time. In the South American works with which he was concerned, the boiler was not connected directly to the consuming mains, but fed a Ruths accumulator, because a cheap supply of electricity was not available at the time when the steam was required, and switches were arranged so that when the full capacity of the accumulator was reached the current was automatically cut off and the boiler went out of action. On the other hand, if steam were being used during the time the boiler was working, the pressure in the accumulator would fall according to the demand, and the input from the boiler was automatically increased, so that the pressure and quantity of steam entering the accumulator might be varied to suit the demand.

The very small amount of wear and tear in the electric boiler was undoubtedly attributable to the fact that the greatest heat in the whole apparatus was at the point where the steam was generated, in the middle of the water, and the lowest temperature was necessarily at the outside of the boiler plates. Incidentally, this made for small heat radiation.

The electrodes, of course, might be expected to show some signs of deterioration, but owners of boilers which had been working 10 or 12 hours a day had told him that there was no wear of the electrodes after two, three, or even four years of use. This was due to the fact that in both types of boiler the greatest heat was developed, not at the electrode itself, but at some distance from it. This result was brought about in the "Volta" boiler by the movable tubes, which acted as a deflecting shield, whilst the makers of the "Penzold" boiler, considering that the porcelain or quartz tubes were liable to fracture, had evolved a system of surrounding each electrode by four rods which carried a number of insula

ing disks, so constricting the passage from electrode to electrode, or electrode to shell, that the greatest heat was developed away from the electrode itself. He had heard of other makes of electric boilers in which these deflecting shields were not used, with the result that an arc was sometimes formed, which not only ate up the electrode, but also caused considerable out-of-balance on the phases, which, of course, would be fatal to the success of any such boilers if connected to a general electricity supply system.

The plant for the works in South America consisted of one boiler for three-phase, 6,000 volts, the maximum input being 1,000 kW, and maximum output per hour 2,750 lb. of steam at 114 lb. pressure. The dimensions were: height 7 ft. 2 in., and diameter 4 ft. 6 in. There was also one Ruths steam accumulator complete, having a capacity of 19,800 lb. of steam, its length being 57 ft. 6 in., and its diameter 10 ft., with all valves and fitments, including oil-driven automatic valves for 80 lb. and 24 lb., respectively. There was one oil-cooled transformer, 1,000 kVA capacity at 6,000 volts, ratio one-to-one, wound for delta-star. The transformer was required because the power company supplied on the non-earthed or delta system, and the supply to the boiler must of necessity be earthed. Indeed, the action in the boiler was somewhat complicated, being of a combined star and delta nature, but at any rate the boiler shell must be earthed, and the one-to-one transformer was the easiest and safest way out of the difficulty. Steam generation would take place mostly at night, but a certain amount of electricity would be available at meal times, and as the electric boiler could be started up in a few minutes, even an hour's generation of steam would help to keep the accumulator full. The author anticipated results from this installation equal to those obtained on the Continent. He believed there were at present over 200 installations of electric boilers producing steam at high or medium pressure, or heating water for internal warming.

Inasmuch as it was usual to couple with electric installations a system of storage, the author described the Ruths accumulator system.*

In the South American plant its main object was to store up the steam energy which could be produced economically at night and to give it out during the day. It was to be put on the roof of a two-storey building, and provision was being made to triplicate the installation at some future date. It was calculated that the saving, as compared with the present fuel-fired system, would be so great that the whole capital cost of the installation would be covered in three years.

In conclusion, the author said that although the cost of electricity in this country could hardly be expected to rival that referred to as obtainable in South America, and that consequently electric boiler installations on a large scale could hardly be looked for here, there might be cases in which the raising of a small quantity of steam by electricity would be an economic proposition.

Discussion.

Mr. C. M. Read (who visited Sweden on Mr. Wharton's behalf for the purpose of investigating the electric boilers in use there) said the point which had impressed him most was that the use of the electric boiler was looked upon almost as common practice in Sweden; quite a number were installed, and in every case, apparently, they were giving every satisfaction. The use of the Ruths accumulator appeared to be even more general. He was inclined to favour the "Volta" system, in which the current was led in from the bottom, for various reasons. He had looked particularly for signs of pitting of the boiler shell due to electrical action, but there were no signs of pitting at all, and there appeared to be no scaling of any sort. The marks of riveting were still to be seen, although the boiler had been in use for two or three years. He had heard that Swedish engineers were experimenting with boilers having a voltage of 33,000 V. They were not worked by the electrode system, he understood, but by applying the current—three phases—to three separate jets of water, the jets being directed one against the other.

Mr. McKinstry (Metropolitan-Vickers Electrical Co., Ltd.) said that in this country there would be a very small market for this kind of plant, but British engineers had to cater for all kinds of conditions in all parts of the world, and for that reason it was of very great interest to them to learn of systems of this description. He knew of cases in India, Australia, and New Zealand where electricity could be supplied at prices which would make the operation of a system of this kind feasible.

Mr. Norman Swindin referred to his experience with a submerged flame boiler, and said he could quite accept the statements with regard to the extremely high efficiency and the absence of scale, due to the fact that the heat was supplied from the inside of the boiler and not through the plates from the outside.

Mr. N. Dufty (of the A.E.G.), dealing with the suggestion that there was very little call for electric boilers in England, said his firm had under construction seven locomotives, driven by steam, for use in rolling mills, the steam being generated by electricity during periods of light load. That had been found to be an economical proposition. Replying to questions as to the feed of the "Penzold" boiler, he said it operated with a magnetic cut-in and cut-out. There had been no trouble with the leading-in insulator. His company had a boiler of 135,000 volts under construction. There was an electric boiler water-heating plant in operation in London. Dealing with criticism of the fact that the order for the Rio plant had been placed in Germany, he said that if British manufacturers wanted orders in Brazil they should send engineers there, just as the Germans had to do.

Mr. S. S. Jewsbury (Messrs. G. N. Haden & Sons, Ltd.) said that his firm had been working on the same lines as Mr. Wharton, and he had visited the Continent to ascertain the most suitable type of electrically-heated boiler to use in connection with the heating and hot-water supply installations at the head offices of the Newcastle-on-Tyne Electric Supply Co. After careful consideration it was decided to provide two electrode type boilers, each having a capacity of 1,000 kW, and working at a line pressure of 6,000 volts. These boilers would generate steam at a pressure of 50 lb. per sq. in. above atmosphere, and would supply it to calorifiers for heating the water in the large heat-storage cylinders of the heating apparatus. Current would be taken between 7.30 p.m. and 7.30 a.m. The building would be warmed during the day by the hot water from the storage cylinders. Similar storage apparatus would be provided for the hot-water supply installation. Each boiler would be capable of regulation between 300 and 1,000 kW, and would have a full-load capacity of 2,800 lb. of steam per hour. Automatic devices would be provided for regulating the steam pressure and the water level. It was hoped that the plant would be working by August this year, and it was anticipated that during the course of the general exhibition to be held in Newcastle next year the Electric Supply Co. would allow visitors to see the steam boilers in operation. As the result of its investigations, his firm was convinced that there was an opening for apparatus of this type in this country, and especially in London; but, of course, each individual case must be investigated on its merits.

The Chairman (Mr. R. P. Wilson), referring to Mr. Wharton's statement that, with coal at 30s. per ton and electricity at 0.1d. per unit, the production of steam by electricity was justified, said that although those conditions did not obtain here, Mr. Jewsbury's remarks would appear to indicate that there were many cases in this country in which the circumstances were such as to bring about an almost identical set of conditions. Our central-station engineers did not appreciate what was apparently a paradoxical point of view, namely, that in many cases it paid to sell electricity at less than it cost to produce.

* A full description appeared in the Electrical Review of May 28th, 1926.

Electricity on Board Ship.

The Royal Mail Steampacket Company's new motor-ship, *Alcantara*, which arrived at Southampton from the builders, Messrs. Harland & Wolfe, recently, has a very complete electrical installation, supplied by four Diesel-driven generators, of a combined capacity of 1,600 kW, in addition to a 75-kW emergency dynamo placed above the margin line, which can supply light and power for all essential services if required. Over 50 large fans are installed throughout the ship for the supply of cool air, in addition to over 450 smaller fans in the state rooms and public rooms for local ventilation. The heating is also electric throughout, there being some 500 large heaters distributed throughout the various apartments, each separately controlled, in order that heating may be regulated at will. All the engine-room and deck auxiliaries are electrically operated, for which over 130 motors are installed, besides those mentioned for driving the ventilating fans; they are of various sizes, the largest being those for the manœuvring compressors, which are of 180 b.h.p., and for the compressors of the refrigerating plant each motor is of 110 b.h.p. A novel device comprises an illuminated track-chart installed in the entrance to the first-class quarters which has a little model ship operated from the electric clock system, and indicates the ship's position at any time during the voyage. Lighting is carried out by some 4,000 electric lamps distributed throughout the vessel, which include the lights for navigation purposes, Morse lanterns, and the high candle-power lamps and lanterns for working the cargo, and in connection with the illumination of the boats under the latest Board of Trade regulations. The ship is fitted with echo sounding gear. In the hospitals and barbers' shops electrical apparatus is installed; there are seven electric lifts and hoists. Cooking is entirely electric: there are five large ranges and two ovens for the bakeries; in addition to salamanders, grills, fish fryers, and toasters; two mincing machines; one cake whisk; one coffee mill; one bacon slicer; one ice-cream machine; four plate washers; three potato peelers; two dough mixtures; one printing machine; one laundry motor; one gymnastic motor; a photographic printing machine; and a very complete system of bells and telephones.

The radio-telegraph installation consists of standard Marconi 1½-kW quenched-spark and valve transmitters, and a valve receiver covering all commercial wave-lengths, augmented by a direction-finder installation. The musical interests of the passengers are catered for by Marconi band-repeater equipment; four microphones and six loud-speakers are included. The *Alcantara*, of 22,181 gross tons, with accommodation for 1,800 passengers and crew, commenced her maiden voyage to South America on March 4th.

The "Ideal Home" Exhibition.

A Review of the Electrical Features of this year's show at Olympia, London.

(*Continued from page 408.*)

ACCORDING to Sir John C. W. Reith, Director-General of the British Broadcasting Corporation (Inc.), every eighth home in America is licensed for the reception of broadcast radio-telephony, while in Great Britain receiving equipment is installed in nearly 3,000,000 out of about 7,000,000 homes. No "Ideal Home" Exhibition would therefore be complete nowadays without a display of receiving apparatus, and it is accordingly fitting that some space at Olympia has been devoted to exhibits of this character.

The B.B.C. Demonstration.

At past shows the B.B. Co. allowed visitors to see how programmes are broadcast, the actual performances taking place in a specially-constructed sound-proof studio being watched through glass windows. This year, however, the point of view of the listener is receiving special attention:

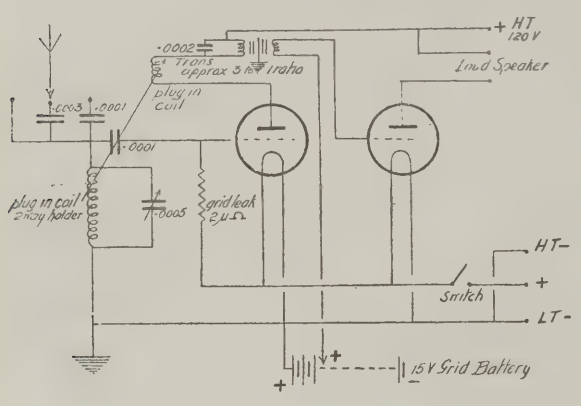

Fig. 2.—A 2-valve Receiver Diagram.

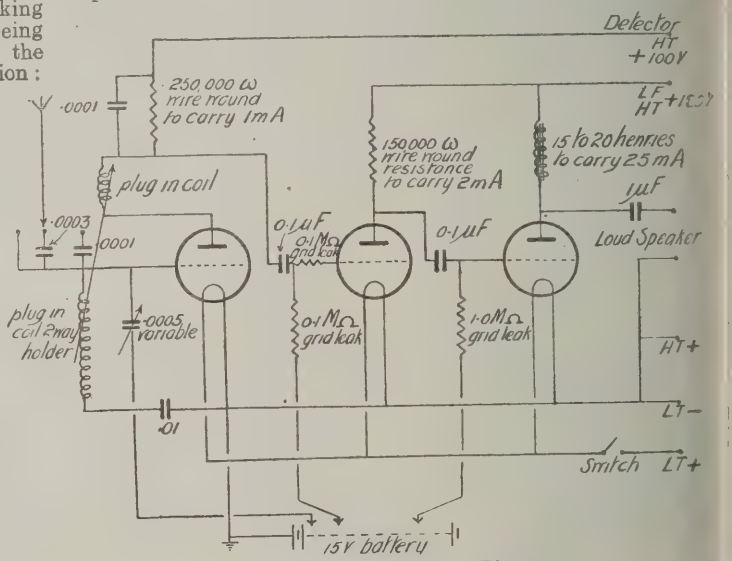

Fig. 3.—A 3-valve Receiver Diagram.

three different types of sets are in operation, the object being to demonstrate the quality of reception and excellence of reproduction it is officially considered well-chosen loud-speaker sets should be capable of within the service areas of the B.B.C. stations. In this way the public is afforded for the first time a reliable and unbiased standard of comparison.

The instruments are representative of cheap, medium-priced, and expensive outfits; no consideration whatever has been given to such factors as appearance, attention having been devoted entirely to sound design and technical merit. The speakers employed are concealed from view and the names of the makers of the component parts wherewith the receivers were built have not been revealed, but the circuit diagrams (figs. 2, 3, 4 and 5, reproduced herewith) are displayed for inspection, and comparable results are obtainable from carefully-assembled high-grade apparatus of reputable make purchasable through any dealer of standing. The two- and three-valve sets (figs. 2 and 3) presumably operate cone speakers, whilst the large set (fig. 4) is a 5-valve, straight-circuit outfit, with one stage of high-frequency amplification; the last stage of low-frequency magnification consists of two large-power valves connected in parallel for driving a moving-coil type of speaker, and the power supply is obtained from lighting mains, fig. 5 indicating how the connection thereto is made.

The novelty of distant reception, which caused receivers to be judged by the number of transmitting stations they were capable of being tuned to, is waning, and vigorous preference is now being shown for quality; that is, fidelity of reproduction of the local programme. Manufacturers are rising to the occasion, and the British Broadcasting Corporation's admirably conceived effort at Olympia will be of practical value to all concerned. Its demonstration of actual possibilities should satisfy most people, whilst the large combination is in a class by itself.

A Cliftophone-Celestion Demonstration.

One of the most interesting of the radio exhibits has been arranged to demonstrate the capabilities of equipment made by Cliftophone, Ltd., and the Celestion Radio Co., to reproduce music of adequate volume in the New Hall. Several systems of electrically reproducing and thermionically amplifying gramophone music and speech are on the market, but one of the particular merits of the above-named outfit is its British origin and workmanship throughout.

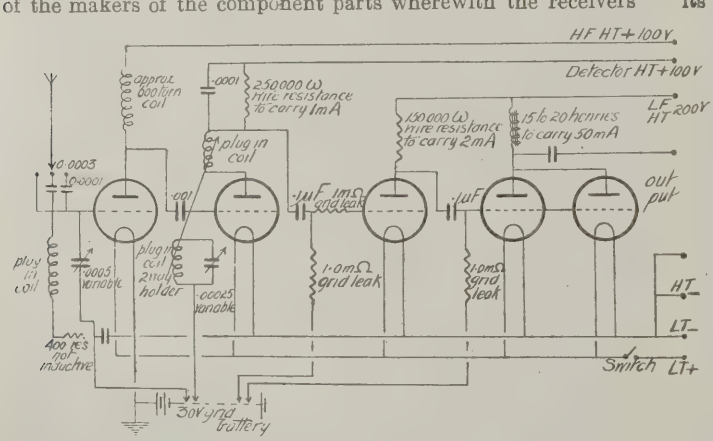

Fig. 4.—A 4-stage Set, supplied from A.C. Mains.

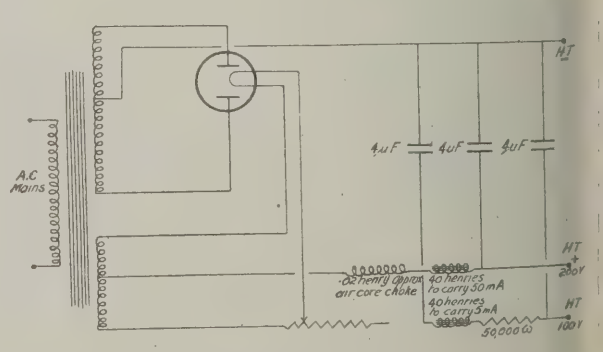

Fig. 5.—Method of Obtaining High-voltage Supply from A.C. Mains.

Mr. W. E. Clifton, the inventor, employs an ordinary type of clockwork gramophone, records and steel needles: the usual sound box and tone arm are, however, replaced with a needle-actuated electromagnetic current generator (said to be constructed on unusual lines) which couples the machine to a thermionic amplifier. The latter is small in dimensions, and incorporates a valve switch and means of controlling the volume; the magnification of the three Marconi valves used is of a large order with a total plate current 20 mA, whilst

the circuit employed is claimed to be of novel form. Details are, however, not available for publication.

To convert the electrical output of the amplifier into sound, three standard "Celestion" A3 radiophone loud-speakers* (one of which is illustrated in fig. 6) are used in parallel: each

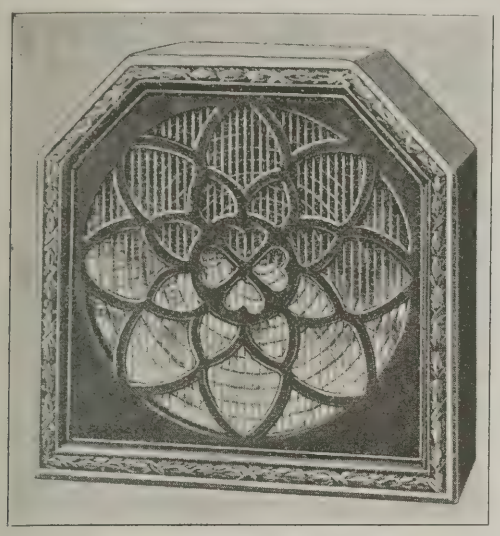

Fig. 6.—Standard "Celestion" Loud Speaker.

being of 2,000 ohms resistance, the impedance of the combination is of the high order of several hundred thousand ohms. The choice of the "Celestion" horn-less speaker is a tribute to its qualities, and the outfit functions satisfactorily, the musical effect being of a pleasant character.

Other Radio Exhibits.

The Cunard Steam Ship Co.'s exhibit affords some idea of the many comforts provided on passenger liners; a fully-equipped wireless cabin is on view, the apparatus including a direction-finding outfit, and an operator is on duty to explain the function of the various pieces of plant, which was manufactured by Siemens Brothers & Co., Ltd., of Woolwich.

The Halycon Wireless Supply Co., Ltd., displays a selection of portable broadcast receivers of the multi-valve type; in addition to these standard models, a portable 7-valve super-heterodyne set is shown, the tuning of which is claimed to have been simplified.

Messrs. S. G. Brown, Ltd., besides samples of their wide range of products, are showing a receiving set that dispenses with the use of valves and accumulator, yet operates a 21-in. loud-speaker. It may be arranged to work with an indoor, outdoor, or frame aerial within a radius of six miles from a broadcasting station and 15 miles from Daventry.

Messrs. Peter Curtis, Ltd., have several patterns of their receivers on view, housed in handsome wood cabinets; also the Curtis-Clayton tester, which is a single-valve receiver with a self-contained frame aerial, but it can also be used as a universal testing instrument, as a wavemeter, a generator of sustained audio-frequency current, a calibrated variable condenser, and for the measurement of resistance, voltage, current, &c.

The "Donotone" loud-speaker, patented by Mr. P. S. O'Donnell is housed in cabinets of handsome and original design, and is of novel construction. The pole pieces of the usual electromagnet are wound for a very high impedance and across them is a spring armature, to the centre of which is fixed a small glass disk holding a flat diamond. Another diamond (pointed) is attached to one end of a short steel rod, which has a reciprocating motion in a sleeve, a light helical steel spring between the rod and sleeve maintaining the two diamonds in simple contact with one another; sound is produced by a tapping, similar to the vibration of an electric bell armature. Several silk disks, from 2 in. in diameter upwards, are threaded concentrically on to the sleeve, the largest (12 in. in diameter) being attached to the free end of the diamond-pointed rod; all the disks are free to vibrate. Several inches in front of the disks a series of gongs, of the spiral clock type, are screwed individually around the mouth of the flare, with metal baffle plates between them; the 24 gongs, ranging from treble C to bass C, are chromatic and tuned to sympathetically respond to their own notes.

L. G. Hawkins & Co., Ltd.

This exhibit comprises an almost complete range of electrical labour-saving equipment for the home, including the scientifically designed "Miller" and "Ivanhoe" lighting fittings and "Universal" electric cookers, suction cleaners, and washing and ironing machines. The "Kelvinator" electric refrigerator plays an important part on this stand, a variety of sizes being shown. It might be safely said that the exhibit is representative of every kind of electrical apparatus for domestic use. Some excellent designs of such apparatus as electrical coffee percolators are attracting the attention of those in search of home-beautifying utensils. Demonstrations are being given practically continuously of electric ironing, cooking, and coffee making. It is of interest to note that Messrs. Hawkins are proud of their claim to be among the pioneers in the representation of the electrical industry at the exhibition. They first exhibited in 1920.

Hotpoint Electric Appliance Co., Ltd.

This firm is emphasising in particular the use of electricity for domestic laundry work, and an interesting feature of the display is the "Maytag" gyrafoam washer, fig. 7, which has only recently been introduced in this country, and which, it is claimed, is the only electric washing machine on the market into or from which the clothes may be put or taken while the machine is running. The tank is rectangular in shape, the corners being suitably rounded inside, and stands on four legs equipped with rollers. The agitating or disturbing element is in the form of four vertical blades projecting from the interior of a shallow cup at the bottom of the tank. This is rotated in alternate directions by means of a crank attached to the shaft of a worm-driven wheel, the worm being belt driven from a small motor conveniently housed under the tank. The effect of the movement is certainly quite distinct from that of the usual rotary action. A vertical extension of the crank shaft to the top of the tank, with its housings, serves as a fixing and driving medium for a wringer, knife cleaner, and a mincing machine. The apparatus can also be used for dish washing, the tank accommodating a wire basket for this purpose. It is interesting to learn that the West Ham electricity undertaking is hiring out these washers on an ordinary rental basis.

Another interesting piece of electrical apparatus to be seen on this stand is the "Eco-Dry" cabinet for the indoor drying of clothes. This is a cast-aluminium cupboard equipped with the necessary sliding brackets and a suitable

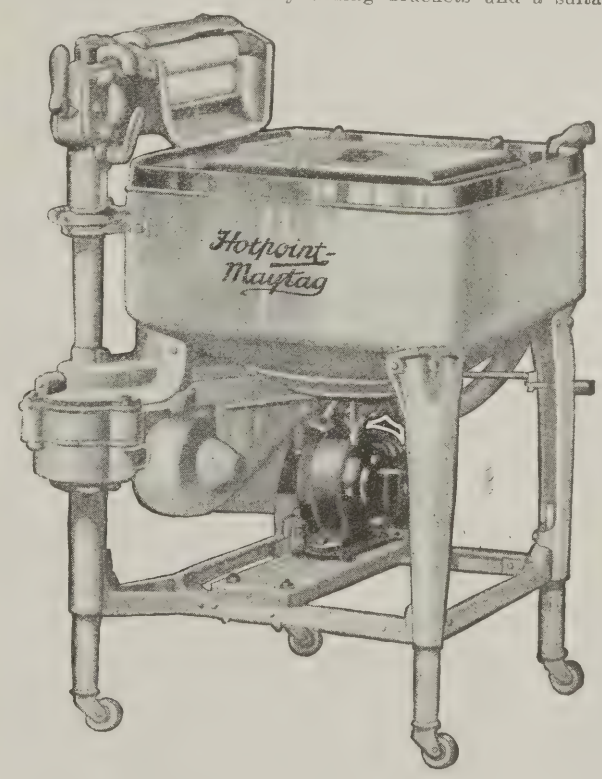

Fig. 7.—The "Maytag" Electric Washer.

exhaust chamber. It is loaded at 3 kW. The "Hotpoint-Utenco" ironer is also shown by this firm. The outstanding feature of this machine is its two-roller principle of construction. The polishing roller, which is evenly electrically heated, revolves five times faster than the feed roller, thereby producing a gloss equal, it is claimed, to that obtainable by means of a hand iron. The rollers are self adjusting. On the pedestal carrying the rollers is bracketed the driving motor, about ¼ h.p. The heating loading is 1,000 W. The "Hotpoint WB25" wash boiler is also exhibited. This holds 10 gallons of water and is provided with immersion heaters. Of particular interest in the cooking equipment shown on this stand is a new type of totally enclosed boiling plate. The elements are housed in a sheet-metal box, which is bolted to the cast top-plate. The under side of this is treated with a special insulating material. The plate is sent out sealed, complete with a 3-pin plug, under a 12 months' guarantee. It is interchangeable with the existing 3-heat plates.

With regard to the large electric-light shades at Olympia, described in our last issue, we are asked to make it clear that Messrs. Wm. McGeoch & Co., Ltd., were not the contractors for installing the shades, but were responsible to the architect, Capt. Tanner, for them. Messrs. Walford Art Co. were engaged by Messrs. McGeoch as sub-contractors.

(To be continued.)

Correspondence.

Correspondents should forward their communications **as early as possible.** *No letter can be published unless we have the writer's name and address in our possession.*

The Price of Electricity for Home Use.

Hearty congratulations on your leader concerning the reduction in the price of electricity for domestic purposes. Could not you see your way to having a special "Economic" number of the Review, with reports from one or two undertakings enlightened?

In this connection may I suggest that the two-part tariff be adopted throughout the country, and, furthermore, be the only tariff as far as domestic supply is concerned? This for three very good reasons:—

(1) Considering the complex nature of the subject, it is simple, and is the only tariff that is fair (or can be made so) to both consumer and supply undertaking.

(2) By means of rebates on kW connected and type of load it lends itself readily to preferences for large consumers and those who by various devices improve the load factor. This system of rebates will obviate any necessity for double metering or time switches, thereby keeping down capital expenditure.

(3) The standing charge and the price per unit could be, and should be, revised every year, or, for that matter, every six months, bearing in mind not only the number of new consumers connected, but the capital charges involved in the new extensions.

I am convinced that the price of electricity is the biggest factor in deciding the rate of increase in domestic electrification, and a systematic reduction in the price, based on the previous six or twelve months' working, widely advertised, would be the best way of bringing in new consumers, and encouraging the extended use of current by old ones.

£40,000,000 (if my memory serves) was spent at last year's motor show, simply because the car industry had created a demand by reducing the price, instead of carrying on after the manner of supply undertakings.

Cyril J. Crawshaw, B.Sc.

Newcastle-upon-Tyne, *March 11th*, 1927.

River Water—or Cooling Towers?

The reason given by Mr. R. J. Kaula in his letter dated February 7th, 1927, why turbine manufacturers rigidly confine the consumption guarantee to one set of conditions, appears to the writer to be quite inadequate, for it ignores the fact that the terminal pressure will vary over an appreciable range according to the season of the year. In a river-side station the terminal pressure will vary from round about 0.7 in. Hg. in the winter to about 1.4 in. Hg. in the summer, and such variation is not controllable. Therefore, the turbine will have to operate over such a range normally, and it will entirely depend upon the season of the year when the official acceptance tests are made as to what terminal pressure will be realised. Surely the purchaser is entitled to call for a guarantee covering the normal variation of an important condition. The writer fails to see why a guarantee giving definite consumptions at, say, 0.8 in., 1.1 in., and 1.4 in. Hg., should be any less clear or unequivocal than a guarantee giving the consumption at, say, 0.9 in. Hg. only. To the writer, the two forms appear to be equally clear, and from the point of view of comparing the relative merits of tenders and also from a testing point of view, the guarantee covering the normal variation in conditions offers definite advantages to the purchaser. Readers interested in this side issue will find it adequately outlined in a paper on "Performance Guarantees for Power Plant, with reference to Official Acceptance Tests" by the writer submitted at the 1924 I.M.E.A. Convention.

Mr. Kaula states that the thermo-dynamic efficiency of two units operating at the respective terminal pressures given in the article will be practically the same. If the term "thermo-dynamic efficiency" is given its true meaning—the ratio of heat output to heat input—the statement is obviously incorrect. Presumably the term "thermodynamic efficiency" has been used to denote "efficiency ratio." (In the writer's opinion the modern fashion of using thermo-dynamic efficiency to denote efficiency ratio should be discouraged as leading to needless confusion.) In whatever sense the term was used, the writer is unable to agree with the statement, as it is contrary to the test results available at present. The statement may become true as design progresses, but the time is not yet. The writer regrets that he is unable to accept Mr. Kaula's estimate of from 7 to 8 per cent. better steam consumption for the respective cases until reliable test results are available in support thereof.

Mr. Kaula contends that test results on the same turbine at different terminal pressures are misleading. This contention only holds good if the turbine is designed for a higher terminal pressure, or lower vacua, than that at which the tests are made. If the turbine is designed for the lowest terminal pressure at which the tests are made, as was the case in the article, then the results are truly comparative. This is amply demonstrated by the characteristics of the consumption-terminal pressure curves in the article. In fact, it is the only practical way of determining the value of advances in the design of the exhaust end of turbines.

The letter of Mr. E. Fawssett in your issue of March 4th gives somewhat better test results than those in the original article. The writer has the privilege of being conversant with the resources and ability of the test department controlled by Mr. Fawssett, and has no hesitation in accepting the figure put forward, namely, 6 per cent. at full load, as accurately representing a value achieved on a large-sized modern turbine. The result quoted would have been more helpful still if the size of the unit, the initial steam pressure, and the percentage of steam bled off for feed heating, had been given. The writer surmises that the capacity of the sets in question was from 20,000 to 25,000 kW, that a very appreciable amount of bleeding was part of the design, and that the sets were put into commission last year. The machines on which the results of the article were based were of 12,000 kW (economical load) and were put into commission in 1921 (scarcely ten years old as stated by Mr. Fawssett), so that in five years, with the turbine size doubled, and with the development of extensive bleeding (the latter appreciably affects the gain due to terminal pressure), the gain realised is still appreciably short of the theoretical, and is still only about 60 per cent. of that claimed over ten years ago, when the actual results were not so good as those shown in the article. Incidentally, the test value quoted by Mr. Fawssett is appreciably lower than that claimed by Mr. Kaula, and there can be little doubt about the size and modernity of the sets in question.

It should be pointed out that the value quoted by Mr. Fawssett almost certainly represents the maximum gain that can be realised at present for the largest-sized turbines, and that this maximum will not be realised with turbines of smaller capacity; also it does not follow that turbines even of the same, or larger, size by other makers will necessarily realise an equal gain. All the power stations are not going to be equipped with such large-sized turbines, for some years at any rate. It should also be pointed out that as initial steam pressure increases (the modern tendency) the gain due to terminal pressure decreases.

With the definite modern trend towards increased initial steam pressure the gain due to decreased terminal pressure falls successively, as is illustrated by the following table based on Callender's heat-drop tables:—

Theoretical Decrease in Steam Consumption due to Decreasing Terminal Pressure from 1.8 in. Hg. to 0.9 in. Hg. abs.

Initial Superheat Constant at 200 deg. F.

Initial pressure, lb./sq. in. gauge	400	600	800	1,000	1,200
Theoretical gain, per cent....	6.9	6.4	6.1	5.8	5.6

Taking account of the modern trend toward increased initial pressure, it will be realised that the figure quoted by Mr. Fawssett practically represents the highest gain to be achieved, for advances in turbine design will be more than negatived by the decrease in the heat drop as initial pressures increase.

Summing up, on the evidence available, it may be said that at the present time the value of river water as compared with cooling towers will vary from about 4 per cent. with medium-sized turbines to about 6 per cent. for the largest size of modern turbines.

Mr. Fawssett's letter was welcome as giving authentic test results. It does not nullify the objects of the article, but helps to carry the matter a stage further, the objects being to investigate the actual gain due to using river water, and to point out that the actual gain was usually considerably over-estimated.

Stoke-on-Trent, *March 9th*, 1927. **J. N. Waite.**

The "H" Type of Cable.

In view of the recent controversy in your columns regarding 33,000-volt cable, with particular reference to the "H"-type cable, it is interesting to note that, in connection with the electrification of the Berliner Stadtbahn, orders have just been placed for 265 km. of 30,000-volt three-core cable.

Of this quantity, 184 km. is specified to be of the "H" type, the sections being 120 sq. mm. and 95 sq. mm., and 81 km. of the normal or belted type, the sections being 70 sq. mm. and 25 sq. mm.

The cable is to be manufactured in lengths of 800 metres.

London, *March 8th*, 1927. **E. Bowden.**

Two-Part Prepayment Meters.

I am pleased to note that Mr. Howell's remarks, and my own, at the last E.D.A. meeting, have received the attention they deserve, and that the Meter Engineers' Technical Association has set up an Expert Committee to deal with this very important question. It is about 12 months since I brought this matter up, and there was promise then of some form of British-made "two-part prepayment meter" coming on the market. For some reason this has not yet been given to us.

There are at least three makes of Continental meters of this type available, and in use in thousands, to my knowledge.

My own opinion is that the two-part prepayment meter is a real necessity, particularly with assisted wiring schemes and two-part tariffs being taken up by supply authorities. I maintain that the consumer would put 5s. or 6s. a month in the meter at once, by way of a fixed charge, if he had to, just as much as he would pay the rent once a month, and, moreover, if the small consumer knew he had to put the money in the meter for the fixed charge, before he could get current, he would do so. This is only a matter of education and custom. By asking for the fixed charges through a collector, the consumers can, and often do, say they will pay next month, and often run up a debt.

If the patent rights of those meters already being manufactured are the stumbling-block, then I suggest that our manufacturers should do the same as some Diesel-engine makers do, and take out a licence to manufacture in this country one of the already patented meters of the type required.

I hope the Meter Engineers' Expert Committee will draw a "winner" from our British meter manufacturers. I think they have a "sporting chance."

H. W. Watts,
Electric Light Department, *Resident Electrical Engineer.*
Epsom, *March 7th*, 1927.

Power Supply for Wireless Sets.

The difficulty between Mr. P. K. Turner and "Interested" appears to me to admit of a comparatively simple explanation.

It is a fact of observation that to produce a material increase in volume of *undistorted* reproduction necessitates an increase in power-valve (output) capacity which appears to be considerably greater than in proportion to the resulting increase in volume. It is possible to have undistorted reproduction with quite a small power (valve), *e.g.*, 4 mA at 120 volts (*i.e.*, 0.48 watt) as quoted by "Interested," or even with an ordinary receiving valve, at a relatively moderate volume, but it is essential for a large volume of undistorted reproduction to have a large power (valve) consuming, say, 20 mA at 200 volts (*i.e.*, 4 watts) as quoted by Mr. Turner. In my own case, for satisfactory operation of two or three speakers, each with a good volume, I use no less than 24 mA at 250 volts (*i.e.*, 6 watts) (LS.5 valve).

It is hardly necessary to confirm Mr. Turner's contention of the self-evident absurdity of comparing reproduction of *equal* volume when utilising a small power and a large power respectively, it being clear that if a large power valve is worked just within satisfactorily undistorted volume, a small power valve would be overloaded on the same *output* and would cause distortion.

There is another thing to take into account in this matter, and that is that our own estimation of volume varies according to circumstances. When everything has been and is quiet it is possible in an ordinary room to enjoy quite low-power undistorted reproduction, and even imagine that it is loud; but in other circumstances it is very necessary to have much louder reproduction, for which there can be no question but that the contention of Mr. P. K. Turner is correct.

E. Fowler Clark, B.A., B.Sc., A.M.I.E.E.
Derby, *March 10th*, 1927.

Although I stated that my last letter should be the final one in connection with the above question, I trust that you will find room for this in reply to one from Mr. Turner in your issue of March 11th.

In the first place, I certainly do not agree with Mr. Turner's idea of a comparative test; in spite of the quite voluminous correspondence that has taken place it is evident that Mr. Turner has not yet quite grasped my contention, and I trust that I may be allowed to recapitulate a little.

This very interesting correspondence, from its inception and before Mr. Turner or I entered the field, dealt quite definitely with BROADCAST receivers, by which I understand the ordinary commercial set, or home-constructed set with commercial components, and not laboratory instruments. I have endeavoured to keep it on these lines, and it will be remembered that the statement to which I originally took exception was as follows: "Our own receivers," said Mr. Turner, "consume from 13 mA in the 2-valve type to 20 mA in the larger receivers, below which it is impossible to obtain good reproduction." This I maintained was excessive and unnecessary in a broadcast receiver, and I stated that I could get "distortionless" (later amended to "pleasing") results with an expenditure of 8 mA only on a 4-valve receiver. I pointed out that in addition to this, the receiver I was using employed three transformers in the low-frequency amplifier (incidentally, it also dispenses with grid batteries), which was also not in agreement with Mr. Turner's views.

My next contention was that the final test of the quality of reproduction of a broadcast receiver is the competent human ear. A person buying a broadcast receiver does not take it to a laboratory for test and to study wave-forms; but I agree that the tests for a laboratory instrument might be those suggested by Mr. Turner. We are not, however, concerned with these at the moment, as the discussion deals with broadcast receivers only.

I have the greatest respect for Mr. Turner's qualifications, and do not propose to enter into any discussion with him on the research side, but to confine myself to the commercial side. I am very sorry that the name of the makers of the receiver that I am using was mentioned by Mr. Turner, although that in itself is a guarantee of the excellence of the instrument, but praise or criticism of definite commercial products in a correspondence column is not as a rule very edifying.

If Mr. Turner will carefully read my letters he will find that my claim for "equal performance" will amount to this: that any standard commercial broadcast receiver, consuming 8 mA with four valves, will give equal performance to any other equally standard instrument consuming 20 mA or more. He cannot seriously think that I would compare a commercial receiver with a laboratory instrument, especially in view of my "humorous" reference to museum specimens.

My idea of a test would be to take the two receivers to be compared, each with their own loud-speakers, &c., to various parts of the country, the more difficult the position the better, and there demonstrate the two instruments to a group of persons competent to judge on aural results alone. Questions of strength or selectivity *must* enter into the test conditions of a broadcast receiver, and the tests described by Mr. Turner, although interesting, are hardly those to which commercial receivers should be submitted, and would convey nothing to the unfortunate individual who may be considering the purchase of a receiver and will have to pay the running costs if it has a consumption of 20 mA.

March 11th, 1927. **Interested.**

[This correspondence may now be regarded as closed.—EDS. ELEC. REV.]

Portable Domestic Appliances: Earthing and Flexibles.

We are very glad to see that the question of domestic earthing is being discussed freely in the technical Press. Mr. Joshua Rose sums up the matter briefly; but his statement is adequate, because the necessity of providing complete protection against shock in the home is so obvious that no more is required to secure agreement than the mere mention of it. The aim of all electrical manufacturers should be to ensure the safety of the consumer, and Mr. Rose's suggestion that the Institution of Electrical Engineers should place this matter before the Home Office is a very sound one.

We take this opportunity of referring to your short editorial article, entitled "Faults in Flexibles," appearing on page 374 of your issue of March 11th, and of supporting you heartily in your reminder that here, as always, prevention is better than cure. As a result of our careful and prolonged consideration of methods of preventing these annoying troubles, we have adopted, as is well known, the use of cab-tire-sheathed flexibles for all our plugs to the entire exclusion of ordinary flexibles, which are much too weak mechanically to be satisfactory; and our further provision of a short length of flexible metallic tubing surrounding the sheathing at the point of entry to the plug removes the last chance of breakdown. As you rightly point out, faults in flexibles, though small things in themselves, are very irksome to users, especially if they are frequent; they are therefore a possible hindrance to the extended domestic use of electricity, and as such should be rendered impossible. **A. Reyrolle & Co., Ltd.**

Hebburn-on-Tyne, *March 11th*, 1927.

Faults in Flexibles.

I suggest that the writer of the leaderette under the above title, in your issue of March 11th, does not read the advertisements in your journal. Or if he does read them, he has overlooked or forgotten that we manufacture and have advertised our "Thermoid" flexible cord, which is designed to overcome faults due to the continual bending of the cord, particularly at the point of entry. "Thermoid" flexible cord has been used with much success on all kinds of portable apparatus, since we introduced it more than ten years ago. It has a cotton-covered conductor of combined steel and copper wires which is insulated with vulcanised india rubber; two twisted cores are made circular with cotton wormings, braided with worsted and finished with glace cotton braid. It is a strong, well-padded flexible cord which does not kink and which does not support combustion. We make it also with asbestos serving instead of worsted braiding.

You complain that manufacturers do not devote enough attention to this matter of flexible cords for portable apparatus, but we trust that after this explanation you will credit our company with having made an effort to overcome the trouble.

Where we seem to have failed is in getting everybody to read our advertisements and literature, and to take action when they have read them. **W. A. Moore,**
Advertising Manager,
W. T. HENLEY'S TELEGRAPH WORKS CO., LTD.

London, *March 15th*, 1927.

[Our correspondent has made "a very palpable hit"; we congratulate his firm on the design of its flexible cord, of which we shall make trial.—EDS. ELEC. REV.]

A Metering Problem.

With reference to the letter from your correspondent "E.H.K.P.." which appeared in your issue of March 4th, and to the two letters on the same subject in your current issue, we would like to draw particular attention to Mr. Frank Rostron's remarks to the effect that "all the information necessary to ensure arrival at the correct conclusion is not available."

It would appear that they apply with particular force to the present case, for we have the strongest possible reasons for believing that the Aron meter concerned had never been correctly connected to its transformers, with the inevitable result that the meter combination "has never read correctly," and we may here state that large under-registrations are generally traceable to this cause rather than to inaccuracies in the meters themselves. **Aron Electricity Meter, Ltd.**
F. A. NIELD.

London, *March 11th*, 1927.

With reference to " E. H. K. P.'s " metering problem, it is rather unfair to condemn one meter and state the other to be correct when, with a portable standard meter, no two read alike, unless the supply company has tested the Sangamo, which appears to me unlikely. I think the quickest way out of the difficulty would be to send the portable standard to some neutral testing department, such as the School of Technology, which would give a more satisfactory conclusion. I may state that it is not common practice to connect other makes of meters and transformers together, first, because at the makers' each meter is tested with its own set, and, secondly, taking this case in point, the makers would not guarantee their meter with any other make of transformer.

March 8th, 1927. **F. J. M.**

Supply Undertakers' Regulations.

We have just had our first experience with the County of London Electric Supply Co., which has recently started supplying electricity in this district. For a small private-house wiring installation carried out by us we had adopted our usual practice of putting in a consumer's ironclad combined main switch and fuse. After the undertakers had laid in their cable and fuses, they flatly refused to connect, or install, the meter, or even test the wiring, until this switch and fuse was replaced by separate articles, it apparently being their regulation that the meter must be connected between them. They require the consumer's switch to protect their meter, and insist that the consumer's main fuse shall be on the consumer's side of the meter.

We, and others that we have referred the matter to, have never heard of such a requirement, and apart from questioning the desirability of such an arrangement and the undertakers' power to insist on it, surely it is a patent absurdity not to allow the consumer's fuse to be on the undertakers' side of the meter as well as the switch.

If this regulation can be enforced, it means that the ironclad combined switch and fuse—quite a recognised and sound piece of apparatus—is entirely ruled out and will not be allowed by these undertakers. We should like to have your readers' opinions on the matter, and to hear what can be done to enforce the provision of a supply if the requirement is illegal.

Wanstead, *March 5th*, 1927. **C. & E.**

A Handicap to Electrical Progress.

I would appear to have interested a kindred spirit in " F. Curius Dentatus," who replies to my letter in a parable. He infers that I am amused at something that is not new, counsels moderation, advises people, when asked for absurd deposits, not to complain; and urges that supply authorities do not understand business in the ordinary sense.

I do not agree. The fable of supply authorities not being business people died years ago. There is a jest, but what Kipling called " a bitter jest," in this subject, of which " F.C.D." misses the point. I still claim to have discovered a new incident, and for the benefit of all other busy electrical engineers, who to my surprise up to now have taken no notice, I will endeavour to put the point in the plainest English :—

Leicester, a progressive city in the prosperous Midlands, population about a quarter of a million, possesses up-to-date gas and electricity supplies. These are directed by a committee of some of the finest business men in the city, whose policy is carried out by a recognised business manager. This body announces to citizens, and so to the world, that the deposit it requires for gas lighting and cooking in a house is £2; and for part lighting only the same house by electricity, £5.

Logically, there is only one conclusion : Its opinion, based on knowledge, practice, and experience, is that *electricity for household use is more than two-and-a-half times as dear as gas.* The strange fact also exists that, in spite of this opinion, which it backs to the extent of refusing business, it still wastes money on propaganda and allows the E.D.A. to do likewise. One at least hopes that the rest of the gas industry is not aware of the convictions of Leicester.

Cardiff, *March 7th*, 1927. **Ivan Fawcett.**

Ferranti and Edison.

Like many, I expect, I was much interested and very pleased to read your article relative to the election of Ziani de Ferranti to be a Fellow of the Royal Society—a most worthy acknowledgment of a very worthy man; but what interested me almost as much was the coupling of his name with that of Edison.

I wonder how many there are to-day who remember the advent of each in this country, and had the privilege of coming into personal contact with both. How widely different were the two men—Ferranti a self-reliant personality who depended entirely upon himself—it seemed just the opposite with Edison. True, I saw a good deal more of Ferranti, and only some years later became associated with Edison—I think it was Jubilee year—whereas my interests with Ferranti ended in or about 1884.

I know, however, I was not alone in taking a comparatively detached view of Edison, compared with Ferranti, the reason being, I think, that one rarely heard the name of Ferranti except " on his own," whereas Edison seemed always to be coupled with someone else, in spite of the fact that Edison was some 14 or 15 years the older. Take the Edison-Bell telephone, the Edison and Swan lamp, and the Edison-Hopkinson dynamo as a few only of many instances.

The only " combine " I remember of Ferranti's—an almost commercial necessity—was Ferranti, Thomson & Ince, and even this, I rather think, was almost a marriage combine. But the doctor's early times were by no means all honey, and many were the anxious days and nights spent in Appold Street and elsewhere.

The present generation must not forget that in those days we worked with about 50 volts; induction was practically unknown; and as for " phasing "—no one had heard of it. So much greater therefore the credit to the man who overcame all difficulties—so to speak—single-handed.

Luton, Beds., *March 8th*, 1927. **Harry South.**

The Salaries of Engineers.

The correspondence on this subject which you have recently published has been of considerable interest to the members of this Society, which was founded with the purpose of improving economic conditions within the engineering profession.

There can be no two opinions on the question of the general average of engineers' salaries: that it is deplorably low is beyond dispute. The Salary Census taken by this Society in 1923 and again in 1925 showed that, bearing in mind the nature of their work and the time and expense of their training, engineers belonged to one of the worst-paid professions. The figures were published in your columns at the time, but we will be pleased to supply them to any inquirers who may care to write to us for them.

The task of attempting to improve matters is a slow and difficult one. If engineers would create for themselves a representative protective body, similar to the British Medical Association, that task would be rendered easier. The scientific institutions cannot be got to move in the matter; they take the view that to do so would be outside the scope of their activities.

This Society has come definitely to the conclusion that the surest and soundest method of raising the status of the profession is the statutory enactment of a comprehensive measure of registration for engineers. The Engineers' Bill now before Parliament has been prepared and put forward by the Society as its chief contribution to the solution of the present economic difficulties of the profession. If all those who are interested in raising the status of engineers would help us in furthering the progress of the Engineers' Bill, with a view to its early passage into law, they would be doing something practical towards the raising of salaries.

Society of Technical Engineers,
Richard Hazleton, *Secretary.*

London, *March 11th*, 1927.

I have followed with great interest the letters in your " Correspondence " columns on the subject of engineers' salaries.

The failure of the I.E.E. to defend itself against the charges of indifference levelled against it is a striking proof of the lofty contempt with which that body persistently treats the vast majority of its members. The Institution, by its silence, admits that it is willing to accept the subscriptions of hundreds of underpaid electrical engineers, whilst caring nothing about their welfare. The Benevolent Fund is a good scheme, but the vast majority of the members of the Institution simply cannot afford to support the Fund. It is consequently hopelessly inadequate; but it could be made unnecessary for such a fund to exist, if the members of the Council would take an interest in the rank and file of the Institution.

Your last correspondent was right when he laid part of the onus on the employers, but the manual worker found out half a century ago that the employers of this country could not be taught morality unless there was force at the back of the teaching. We see the result to-day in the advanced Socialism of the manual workers. In America the employers have realised that to have contented employés is sound economy. In this country, on the contrary, our employers are driving their technical staffs more and more into the Socialist ranks. When that party realises the readiness of thousands of middle-class people to support a moderate Socialist policy, it will sweep the country. The employers will then have only themselves to thank if they find themselves in trouble.

Transmission.

March 12th, 1927.

With reference to the letters in your columns *re* engineers' salaries, I would thoroughly endorse the sentiments expressed by these martyrs to electrical science, who have spent much money and time on education in order that their employers may reap a rich harvest.

These " poor blighters " have given up to study many weary hours after their daily task has been completed, which might have been used for healthy recreation.

Surely it is the conditions from which these Human Documents that you have published have arisen, which give rise to Socialistic tendencies, and it is not surprising to find that comment has been withheld by the bodies concerned, as doubtless they have been justly put to shame.

March 11th, 1927. **Delta Star.**

The Birmingham Electric Club.

Annual Dinner.

THE sixteenth annual dinner of the Birmingham Electric Club was held at the Grand Hotel on March 11th.

Mr. A. C. BAKER, chief engineer of the Birmingham Corporation Tramways, in proposing "The Electrical Industry," commended the Electricity Act as having been devised to provide the greatest good for the greatest number. The electrification of railways had not developed as rapidly as some of them wished. Fortunately, however, there was a move in certain directions, although nothing had yet happened, towards the electrification of main lines. He thought it was only a matter of a short time before they would see some development in that direction. The speaker declared that tramways were not likely to be scrapped for many years to come. Tramways in this country used about 700,000,000 kWh of electricity annually, costing about £3,500,000. If tramways were scrapped, the electrical industry would lose a good customer.

Mr. GEORGE VERITY, in responding, said he believed an era of great prosperity was coming through the agency of the Electricity Act, the publicity given to the industry, and the forward movement all along the line. Initiative and enterprise had placed the electrical industry in the forefront. Household lighting, heating, and cooking would provide one of the greatest developments that the industry had experienced.

The civic toast was proposed by Mr. D. G. BROOKS (secretary of the club), who reviewed the inventions of famous Birmingham men in the realm of mechanics and combustion, to which the Lord Mayor (Ald. A. H. JAMES, C.B.E.) responded. Alluding to the national electricity supply scheme, his Lordship said its provisions in the main were excellent, but in their application one must necessarily have some regard to the welfare of local industries. He was glad to say that the Electricity Commissioners had sanctioned the continuance of the 25-cycle system in Birmingham.

Commander R. L. NICHOLSON, D.S.O., proposed the toast of "The Birmingham Electric Club," and the President (Mr. T. BIRKETT), in reply, said that the club brought together various interests for the common good of the industry.

Mr. F. FORREST, M.I.E.E., proposed the health of "The Visitors," and Col. J. F. LISTER, C.M.G. (chairman, South Midland Centre, I.E.E.) responded.

Published Specifications.

Compiled expressly for this journal by a firm of Chartered Patent Agents. The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

Trade Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within month from March 9th. In the case of foreign applications, the names and addresses of the British representatives are also given :—

Spotter. No. 472,913. Class 8. Electric batteries.—P. Schmidt, trading as the Elektrotechnische Fabrik Schmidt & Co., Berlin. (Wheatley and Mackenzie, 40, Chancery Lane, W.C.2.)

Octron (lettering and design), No. 475,562, all goods in Class 8; and Octron (lettering only), No. 475,560, and No. 475,564. Class 18. Electric alarms (as systems in buildings) and complete lighting sets for vehicles. Octron, Ltd., 32, Charlotte Street, Birmingham.

Blue Spot-Marblock. No. 475,883 Class 8. Instruments and apparatus for use in radio-telephony and telegraphy.—Ideal Radio-telefon und Apparate Fabrik Gesellschaft, Berlin. (Lewis W. Gould, 5, Corporation Street, Birmingham.)

Ancahevea. No. 476,717. Class 8. Electric cables.—Callender's Cable and Construction Co., Ltd.

Mon Gallia (lettering and design). No. 473,491. Class 40. Caoutchouc in plate, strip and moulded form and accumulator casings made therefrom.—Compagnie Générale d'Electricité, Paris. (Cruikshank & Fairweather, 65-66, Chancery Lane, W.C.2.)

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

ABERDEEN.—Reconstruction of theatre; manager, Aberdeen Picture Palace, Ltd.

ALDERSHOT.—Extensions to hospital, including X-ray department, for the Committee; S. Friend, architect.

ALMONDSBURY.—Mental colony; Bristol Medical Officer of Health.

BARNSLEY.—200 houses by direct labour; borough engineer.

BETCHWORTH (Surrey).—Alterations, &c., Wonham Manor, for Sir R. Butler, Bart.

BRADFORD.—Public hall; Special Corporation Committee. Central garage; city architect.

BRISTOL.—Housing scheme (110), St. Anne's site, flats, Eugene Street, and baths and wash-houses, Broad Weir (£65,000), for the T.C.; L. S. McKenzie, city engineer, 51, Prince Street.

BURTON-ON-TRENT.—56 houses; borough engineer, Winshill. Electricity supply, Woodville Pottery; Mansfield Bros., Ltd.

BURY (Lancs.).—Houses (200), for the T.C.; James Byron, Ltd., builders.

CARLISLE.—Billiard hall and assembly hall, Fisher Street; J. Leslie, architect. Extensions to bakery, Junction Street (electrical work), for the Co-operative Society; S. W. B. Jack, architect, Lloyd's Bank Chambers.

CHELTENHAM.—80 houses, Hanover Street; Mr. Malvern, borough architect.

CHESHAM (Bucks.).—Housing scheme (150), for the U.D.C.; the clerk.

CHESTERFIELD.—100 houses, Gloucester Road, and Tapton View Road, for Corporation; S. Higton & Sons.

COLCHESTER.—Extensions, Royal Grammar School, for Essex E.C.; J. Stuart, county architect, Springfield Old Court, Chelmsford.

DARLINGTON.—Town hall and municipal buildings; borough surveyor.

DARTFORD.—Bank premises, High Street, for Lloyd's Bank, Ltd.

DERBYSHIRE.—Agricultural institute, for the C.C. (£3,970); Walkerdine, Ltd., builders.

DONCASTER.—Sanatorium, Weston Road, for the T.C.; Dr. Adshead, architect.

DOUGLAS (I. of M.).—Municipal office accommodation; Special Corporation Committee.

DUMFRIES.—Additional 130 houses, Balmoral Park, for the T.C.; burgh surveyor.

EASTBOURNE.—40 houses, Victoria Drive; borough engineer.

EAST SUSSEX.—Mental colony; County Medical Officer of Health.

ELY.—Housing scheme (40), St. John's Road, for the U.D.C.; W. McKelvie, architect, Silver Street.

EXHALL.—Central school, Ash Green; A. C. Bunch, county architect, 27, Binswood Avenue, Leamington Spa.

FALKIRK.—Five blocks of houses for Falkirk Iron Co., Ltd. (£7,800); the manager.

FIFESHIRE.—Extensions at Kirkcaldy District Infectious Diseases Hospital (£2,500); J. Cameron, Thornton, chairman of Hospital Committee.

GARLANDS.—Extensions to Mental Hospital, for Cumberland and Westmorland Joint Committee (£20,000); the clerk, Carlisle.

GLASGOW.—Warehouse, &c., at 163-164, Sauchiehall Street, and 81-85, Renfrew Street, for Smith (Glasgow), Ltd., 84, Gordon Street; the manager. Garage at Govan (£11,000); city engineer. Stores and meter workshop, Sydney Street; Corporation meter engineer.

HARWORTH (Worksop).—Houses (164), for Barber, Walker and Co.

HAZEL GROVE (Stockport).—Joinery works, School Street, electrically equipped, for G. Fryer (£10,000).

HIMLEY.—Extensions, sanatorium (£11,110), for Staffs., Wolverhampton and Dudley Joint Committee for Tuberculosis; the clerk.

HULL.—Secondary school, Pickering Road; Education Committee. 250 houses, Trinity House Estate, for J. P. Backwell; F. Runton Waller.

INVERNESS.—Motor spirit depôt for Shell-Mex, Ltd. (£9,000); the manager, Aberdeen.

IRISH FREE STATE (Dublin).—266 houses on the Drumcondra and Glasnevin sites, for the City Commissioners; city architect, Exchange Buildings, Lord Edward Street.

IRVINE.—School (electric lighting) for Ayrshire E.C.; W. Reid, master of works, Education Offices, Ayr.

LANARKSHIRE.—Church at Gartcosh (£6,000); Rev. D. S. Mackenzie, Gartcosh.

LEYBURN.—Kinema, for A. P. Haigh, 2, St. Mary's Place, Barnsley.

LEYLAND (Lancs.).—Additional housing scheme (40), for the U.D.C.; surveyor. Extensions to works, for Leyland Motors, Ltd., Leyland Paint and Varnish Co., and J. E. Baxter & Co.

LONDON (Limehouse, E.).—Premises, Thomas Street, for Sanders Bros. (Stores), Ltd.; Higgins & Thomerson.
(Hendon, N.).—1,020 houses, Watling Estate, for L.C.C.; C. J. Wills & Sons, Ltd.
(S.E.).—Extensions, South-Eastern Hospital (£33,750); Metropolitan Asylums Board.
(Penge, S.E.).—School, Anerley, for the E.C.; the clerk.
(Woolwich, S.E.).—Houses (47), Postell Estate, for the Royal Arsenal Co-operative Society.
(Kensington, S.W.).—Premises, corner Finborough Road and Richmond Road; Sir Aston Webb & Son.
(Westminster, S.W.).—Buildings, Millbank; Imperial Chemical Industries, Ltd.
(Long Acre, W.C.).—Masonic temple, with lifts, &c.; H. V. Ashley, architect.

LUTON (Beds.).—Factory, Guildford Street, for A. Hucklesby, Ltd. Extensions to works, Kingsway, for B. Laporte, Ltd.

MANSFIELD.—Additional 124 houses, for the T.C.; borough surveyor.

NEWHAVEN.—41 houses, for the T.C.; Sherren, Ltd., Cooksbridge.

NEW MILTON (Hants).—Hotel (£12,000), for Mrs. S. A. Ellis; Wallis & Holding, Bournemouth, architect.

NEW ZEALAND (Dunedin).—Town hall for the City Council (£81,000).—*Reuter.*

NORTHAMPTON.—Showrooms and workroom, Mercers Road and Drum Lane; A. & L. Knight.

OLDBURY (Birmingham).—Additional 56 houses, Londonderry Farm site, for the U.D.C.; surveyor.

PONTEFRACT.—School (550 places), Baghill Housing Estate, for the Borough E.C.; borough surveyor.

POOLE.—100 houses, for the T.C.; borough engineer. Town hall, for the T.C.; E. J. Goodacre, borough engineer.

RENFREWSHIRE.—Halls for Thornliebank U.F. Church; the minister.

ROTHERHAM.—Additional housing schemes, Herringthorpe (1,000), for the T.C.; borough surveyor.

ST. AUSTELL.—Houses (50), for the U.D.C.; J. H. Lobb, builder, Mevagissey.

STEVENAGE.—Additional housing scheme (300), for the U.D.C.; R. Gandy, surveyor.

STRETFORD.—School, Low Moss Lane; Education Committee. Alterations, First Avenue; Ford Motor Co. (England), Ltd.

SUNDERLAND.—Housing scheme (216); borough engineer, Town Hall.

SWINDON (Wilts.).—Additional 100 houses, Hurst Estate, for the T.C.; borough surveyor.

TORQUAY.—38 houses, Windmill Hill; Seston & Guscott. 50 houses to complete Windmill Hill Estate; borough engineer. Extensions, tram depôt, Marychurch Road; Torquay Tramway Co., Ltd.

WALMER.—Houses (50), Downs Road, for Dennis, Ltd.

WEYMOUTH.—Re-erection of portion of the Gloucester Hotel; Mr. Finnegan, manager (several thousand pounds).

WORCESTER.—Factory, Diglis, for Lewis Beck, Ltd., Bexville Works; R. T. Earl, managing director.

The

Electrical Review

VOL. C. MARCH 25, 1927. No. 2,574.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

E.D.A. Activities.

LAST week the British Electrical Development Association held its annual meeting—a private function—and its annual dinner, at which a well-earned tribute was paid to its activities and to the colossal effort which it has put forth during the twelve months in collaboration with E.L.M.A.

There are numerous thriving societies and institutions in connection with the electrical industries, each of which more or less adequately serves the interests of its members; but, with the exception of the E.T.B.I., there is none other than E.D.A. whose objects are so largely altruistic, so advantageous to the public at large—and none which so efficiently fulfils the purposes for which it was created. In any reference made to the work of the E.D.A. during the year 1926, full recognition must be given to the fact that its widespread activity has been largely responsible for the marked rate of progress in the use of electricity for domestic service. The cumulative effect of its seven years of activity would alone have produced notable advance if there had been no intensive campaign during the past six months and no help from a seven months' coal shortage. To take a single instance of the far-reaching influence of its work, we may quote the fact that at the Electric House arranged by the Association at the Ideal Home Exhibition of a year ago 150,000 visitors passed through the building, and the large number of 12,000 inquiries resulted. This, followed by the electric-house and other campaign operations which have been proceeding in most parts of the country, has been bearing fruit over very large areas, and some of this fruit has fallen to those who have not deserved it; by this we mean that concerns which have never given the smallest financial support to the organisation have been receiving a reward that they have not earned. We mention this circumstance in the hope that it may quicken some consciences.

At the annual dinner of the Association which followed the meeting, Dr. S. Z. de Ferranti warmly commended the plan of "co-operative advertising" so

effectively put into practice by E.D.A., and Mr. C. A. McCurdy, K.C., president of the Advertising Association, expressed his enthusiastic admiration of the great campaign which is now drawing to a close, describing it as the most efficient and the most ably organised scheme of propaganda that he had ever seen.

At a later stage, Sir Andrew Duncan, chairman of the Central Electricity Board, who made an excellent impression by his declaration that the policy of the Board would be essentially one of friendly and helpful co-operation with all branches of the electricity supply industry and in no sense autocratic or domineering, expressed his appreciation of the admirable work already accomplished by E.D.A., and his conviction that the Association would be a most powerful ally of the Board in carrying out the work for which the latter was constituted. As we have pointed out on previous occasions, the Government scheme does nothing to promote the consumption of electricity, except by freeing the hands of the municipal authorities; that most important and indispensable complement to the work of the Board is left to be provided by the electricity supply industry itself, and it is indeed fortunate that a fully organised and ably directed machine in the form of the Electrical Development Association is in existence which, if adequately supplied with funds, may be relied upon to fill the need.

Such an occasion as the annual dinner, when the work of a particularly heavy year is in mind, affords a fitting opportunity for paying a tribute to the hard-working and painstaking way in which the experienced and tactful Director of the Association, Mr. J. W. Beauchamp, has carried out the duties of his increasingly important office. He has carried on under the heavy burden of recent days without losing his accustomed equanimity or becoming overwrought—which could hardly have been possible had he not confidence in the ability of the Business Manager, Mr. V. W. Dale, the spirit and energy of an experienced staff, and the campaign support of Mr. W. E. Bush. The industry owes much to Mr. Beauchamp for the organisation and direction of E.D.A. during the past seven years, and we make bold to suggest that on the next public occasion of the kind "a few words" from him would be in the nature of a "star turn."

The B.E.A.M.A. Meeting.

An ample summary of the operations of the Council of the B.E.A.M.A. during the past year will be found on later pages of this issue, together with a fairly full abstract of the speech in which the Chairman (Lieut.-Col. R. K. Morcom, C.B.E.) reviewed the course of the electrical industry and the various factors affecting it at home and abroad. In recent years we have come to regard the annual remarks of the B.E.A.M.A. chairmen as authoritative and sound, and we commend the present review to the careful consideration of all our readers. It is important that we should keep ourselves well informed periodically regarding the state of affairs in the various markets of the world, as well as the changing features of the international situation in respect of industrial competition. The turnover for the industry in 1926, though a record, was really a record "by way of an over-flow of pent-up waters." The position of the industrial motor section—a serious decline in orders is reported—is a matter for profound regret, and it is greatly to be hoped that we shall shortly witness a sustained revival of those other industries which at present are insufficiently electrified. Happily, in spite of all obstacles, we have been able to maintain our position as leading supplier of electrical goods abroad; indeed, with exports totalling £18,194,000 in 1926, the electrical industry "takes first place among the engineering export industries of the country." But the financial co-operation of America and Germany is operating greatly in favour of the industrial position of the latter now that she can borrow at 4 to 5 per cent. instead of 10 per cent. interest. The Dawes plan has intensified the competition that we are experiencing from Germany, and "it has served to bring France, Germany, and the United States into closer co-operation with a view to dominating the world markets." After covering these and various other features of the situation as it is officially viewed to-day, the chairman closed by urging the increased need for associated effort in our electrical and allied industries.

State Electricity in the Irish Free State.

The "Electricity (Supply) Bill, 1927," which passed its second reading in the Dail Eireann last week without a division, is a remarkable document. Whilst it resembles in some respects, and is obviously inspired by, our Act of 1926, it goes far beyond that measure in scope and tenor; this arises partly from the fact that it is to take the place of all existing legislation on electrical matters in the Free State, which is wholly repealed (with the sole exception of the Shannon Electricity Act, 1925), but still more from the unprecedented character of the system which it outlines.

The new "Electricity Supply Board" which is to be constituted, on the lines of the Central Electricity Board, is to be entrusted not only with powers and duties such as are exercised by that Board, but also with those of the Electricity Commission, and those of an authorised undertaker empowered to buy, sell, or manufacture anything electrical in any part of the Free State; it is to be armed with compulsory powers to control the supply and sale of electricity, to acquire electrical undertakings, to vary areas of supply, to purchase land, to secure wayleaves, to fix tariffs, and to close generating stations. Arbitration is provided for in some instances, and the Board's regulations for electricity supply, curious to say, must be approved by Dail Eireann; but its powers are extraordinarily wide, and the only control to which it is subject appears to be the right of the Executive Council of the Dail to dismiss any or all of the members of the Board. Speaking in the Dail, Mr. McGilligan emphasised the independence of the Board and its freedom from interference by his Department: once it was set up, he said, he would personally have no interest or responsibility for it. He had given the Board full powers to assume the position of being sole supplier, and the sooner it did that, the better!

We believe in the firm hand and the settled policy, in any class of business; but we have no faith at all in the conduct of trading undertakings by the State, or in the nationalisation of electricity supply, which is here contemplated, and the abolition of private enterprise. The provisions of the Bill savour of confiscation, from which even the municipalities will not be exempt; such a measure could never pass the second reading in a British Parliament.

The Retail Electrical Trade.

Accompanying the present number of the Electrical Review we are circulating to every reader a copy of our second supplement, the *Electrical Retailer and Dealer*. We repeat our request to readers to make the existence of this publication known to their smaller trade acquaintances who are transacting sales direct with the general public. We are anxious to bring it to the notice of every electrical trader, whether he is an electrical contractor, a hardwareman or an ironmonger, an electrical staff employé in a store, or an assistant in the showroom of an electrical contractor or an electricity supply department. If we can ensure that there is a spirit of enterprise being stimulated amongst all men and women in these classes by the reading of appropriate specialised literature which will keep them informed of movements and products, we shall be able to feel that we are doing something to raise the standard of efficiency in a section of the trade which so far has not been conspicuous for its strength, and may, perhaps, in actual fact have been neglected or even received the cold shoulder.

A Small Hydro-Electric Scheme.

The utilisation of a 3-ft. fall for supplying, in conjunction with a storage battery, a comparatively large rural area.

IT would be difficult to estimate the power which is running to waste over the low-head waterfalls on the small streams and rivers in this country. Many of these falls are situated out of the reach of the public supply systems, and it must be worth the while of the surrounding inhabitants to consider the utilisation of the available power for the generation of electricity to fulfil their needs for lighting, heating and power. The problem of utilising the power is, of course, much more difficult when the fall is very low, and perhaps this accounts for more of the streams not having been harnessed than is the case. That the problem can be solved successfully is evidenced by a scheme which has been completed at Avington, on the river Itchen, for the supply of electricity to the seat of Sir John Shelley Rolls, Bart., on whose estate the installation has been put down, and to the surrounding villages of Avington, Easton, and Itchen Abbas, although the available head of water is only three feet, fig. 1.

Fig. 1.—Power Station and Tail Race.

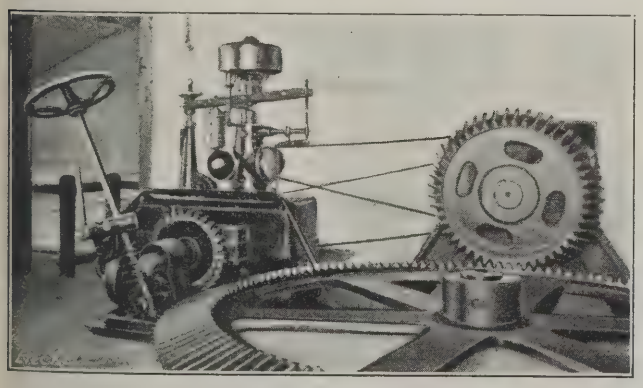

Fig. 2.—Driving Gear and Governor.

For this scheme an old dam, put down some 45 years ago in connection with a water-wheel which was used for grinding corn, has been recommissioned. A 23-h.p. Turgo vertical-shaft turbine, 45 in., 54 r.p.m., made by Messrs. Gilbert Gilkes & Co., Ltd., has been installed, and uses some 5,200 cu. ft. of water per min. Its speed is kept constant during varying loads and differences in head level by means of a Gilkes oil-pressure governor, fig. 2. The turbine belt drives, through spur gearing, a 13-kW Laurence, Scott & Co. dynamo at 550 r.p.m. This machine generates at 220 V; it is over-compounded, but arrangements are made for the short-circuiting of the series field during battery-charging operations.

The turbine plant is used in connection with a 120-cell battery, installed by Messrs. Pritchett & Gold and E.P.S. Co., Ltd., which is capable of a 30-A discharge for 5 hours. By running the turbine plant continuously and charging the battery during light-load periods, a supply can be given on peak loads considerably above the output of the running plant; a most important feature in connection with such small water installations.

A marble switchboard, fig. 3, constructed by Messrs. A. W. Sclater and Son, who were the engineers responsible for the whole scheme, accommodates the necessary measuring instruments and switchgear, including a system of change-over switches by means of which the supply at any time can be given by either the generator, fig. 3, or the battery, or both. A battery charging booster, also of Messrs. Laurence, Scott & Co.'s manufacture, forms part of the installation. It is a separately excited belt-driven machine, with an output of 40 A, 100 V.

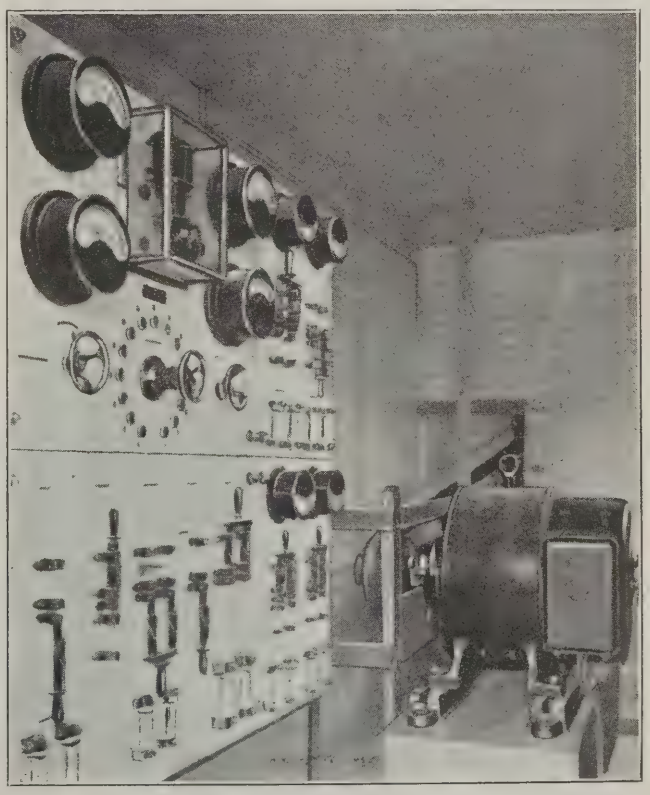

Fig. 3.—Switchboard and Generator.

It is of interest to note that since the plant was installed, the output has been considerably

increased by slightly raising the head at the banks and clearing the tail race where the water has to pass through the small-span arches of a public bridge.

Transmission to Sir John's residence, Avington House, and the villages is effected by means of Henley underground cables, about 4½ miles of which have been used. Besides supplying about 2,000 lamps, the plant provides for heating and cooking in Avington House and a number of the houses in the villages. Power for water pumping and a cold-storage plant is obtained from the installation, which also serves two dairy farms on which electricity is used for power. The consumers include three public houses, three churches, three village halls, and two post offices. A number of cottages are supplied under a free-wiring scheme at 10d. per kWh.

Nearly all the wiring in the villages is carried out with the Henley wiring system, and Avington House is wired with Henley 2,500-megohm wire, drawn into screwed tubing.

Another small hydro-electric installation put down by Messrs. Sclater & Son, for Capt. the Hon. T. H. Watson, Milverton, Somerset, has some interesting features. Here a 12-ft. head of water in a very small stream gives continuously an output of about 12 h.p. The turbine in this case is entirely ungoverned, being so designed as to withstand its own runaway speed, which is about 80 per cent. above that of full load. The line pressure is, however, maintained constant by means of an Isenthal solenoid voltage-regulating device, resulting in a considerable saving in the initial outlay.

Automatic Telephony in Sheffield.

The recent inauguration of automatic switching in the Sheffield telephone area constituted a world record from the point of view of the number of exchanges transferred simultaneously: new "Siemens" equipment has replaced eleven old manually-operated exchanges.

THE latest instance of progress in the provision of automatic telephony in this country is of outstanding importance, for the change-over of the Sheffield area probably constituted a world record so far as the number of exchanges involved in one transfer is concerned, and is certainly the largest in this respect yet undertaken by the British Post Office authorities.

On March 5th nine new automatic exchanges were opened simultaneously, and eleven old manual exchanges were closed down. The transfer to the new system commenced at midnight and was completed in five minutes, the whole operation being entirely successful, so that the Sheffield area now includes the automatic exchanges referred to in Table I. A new manual common-battery exchange, fig. 2, has also been provided, which has 25 trunk positions, 22 "A" positions, 3 junction and miscellaneous positions, and a 16-position monitors' desk for dealing with inquiries.

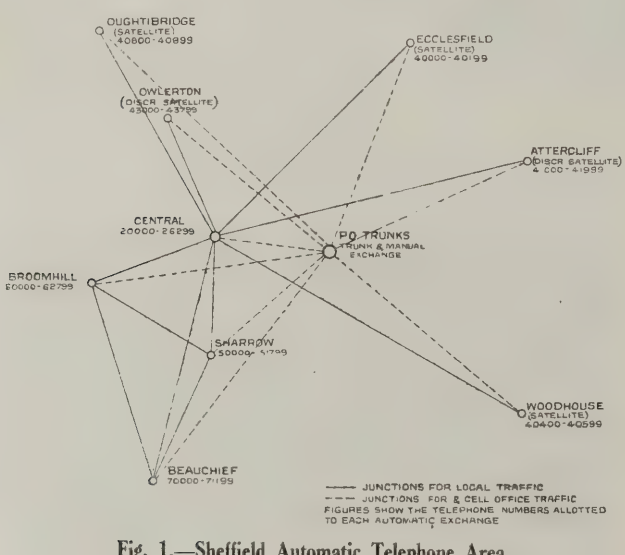

Fig. 1.—Sheffield Automatic Telephone Area.

Table I.

Exchange.	Initial equipment.	Ultimate capacity.
Central	6,300 lines	9,000 lines
Broomhill	2,800 ,,	3,500 ,,
Beauchief	1,200 ,,	1,900 ,,
Sharrow	1,800 ,,	2,600 ,,
Attercliffe	1,000 ,,	1,500 ,,
Owlerton	800 ,,	1,200 ,,
Oughtibridge ...	100 ,,	100 ,,
Woodhouse... ...	200 ,,	400 ,,
Ecclesfield	200 ,,	300 ,,
Total ...	14,400 ,,	25,000 ,,

The new exchanges give a full automatic service within the area, all subscribers being able to "dial" each other and also call direct the new manual exchange which deals with trunk and other calls outside the area, call-office lines, &c. The relative locations of the new exchanges and the inter-connecting junction scheme are shown in fig. 1. Central (fig. 3), Broomhill, Beauchief, and Sharrow are main exchanges, the

Fig. 2.—New Manual Trunk Exchange at Sheffield.

other five being automatic satellites (fig. 4) of Central: two satellites (Attercliffe and Owlerton) are equipped with discriminators which enable calls between subscribers on the same satellite to be completed locally, instead of using junctions to and from the main exchange; these two exchanges also have direct junctions to the trunk exchange. The other three satellites, on which there is comparatively little local traffic, complete all calls *via* their main exchange. All subscribers' numbers are of five figures: the first digit selects the exchange in the case of calls to subscribers on the main exchange, and either the first and second, or the first, second, and third, in the case of calls to the satellites.

Fig. 3.—A Portion of the Central Automatic Exchange.

Public call offices will continue to be used as though they were working on a manual exchange, telephones at such offices not being equipped with dials; they are joined to their automatic exchange in the same manner as ordinary subscribers, except that their preselectors (*i.e.*, line switches), instead of engaging a free first selector when the receiver is lifted, have direct access to a small group of junctions from their automatic exchange to "A" operators' positions in the trunk exchange. The preselector automatically selects a disengaged junction, and the call is indicated to the "A" operator by a lamp signal and answered on a standard cord circuit. All positions in the manual exchange are equipped with dials which enable the operators to dial direct to any number in the area. The trunk operators can also dial subscribers on the Chesterfield automatic exchange, which is 12 miles distant.

All the exchange equipment was made and installed by Siemens Bros. & Co., Ltd., of Woolwich, being the No. 16 system which is already in use in Edinburgh and at other places.

Additional points of interest of the Sheffield system are the 8-position test desk (fig. 5) at Central, from which all line testing in the area is done, and the arrangements for controlling the battery-charging at the small satellite exchanges, which have no permanent-duty man; at these exchanges the charging current is switched on by hand and is automatically cut off when the battery is fully charged. Most of the new exchanges are housed in new buildings, the largest being Central on an island site near the Cathedral; the automatic equipment, power plant, main frame, &c., were installed on the top floor before the outer walls of the lower floors were filled in.

The street telephone kiosks, of which Sheffield possesses more than any other town, excepting London, will also be converted to the automatic system soon.

Fig. 4.—Woodhouse Satellite Exchange.

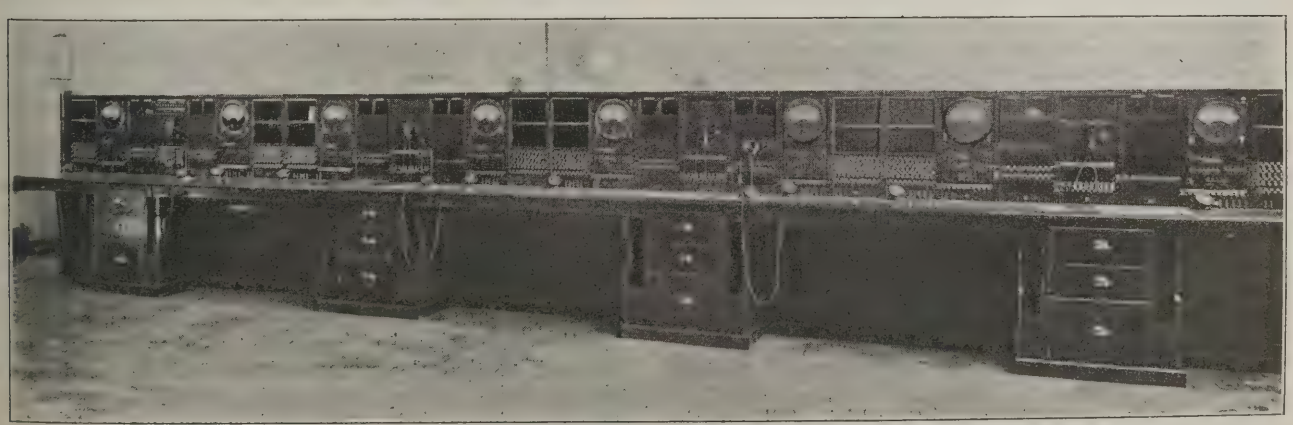

Fig. 5.—Central Exchange 8-position Test Desk, Sheffield.

Easy Payments and the Law.

The necessity for clearly defining the difference between "deferred payment" and "hire-purchase" systems of selling in view of the legal difficulties obtaining in that connection.

By W. ERIC JACKSON, LL.B., Barrister-at-Law.

THERE was a time when the "gradual payment" or "easy terms" system of dealing was confined to the sales of furniture and musical instruments. Nowadays the system extends into every trade, even to wireless equipment and motor-cars. The system, of course, has now passed out of the cloud of suspicion that was once around it, and it is recognised as conferring benefits on both the buyer and the seller. The shortage of money makes difficult the sale of highly-priced articles unless gradual payments can be arranged. Moreover, if the hire-purchase system is properly worked, it should involve no loss, and in most cases a higher profit. The chief difficulty is that the seller has to wait so long for his money; but this is overcome by the existence of finance corporations which are willing to finance transactions of this kind by advancing capital to the seller and recouping themselves out of the instalments under the hire-purchase agreement as they fall due.

There are, however, one or two legal snags which traders should be aware of before setting out upon a series of hire-purchase contracts. First of all, the distinction should be noted between (*a*) a purchaser who buys an article and pays the agreed price in instalments, and (*b*) a person who hires an article, paying rent for it and becoming its owner when so much rent has been paid. The first case is one of ordinary sale, the second is not a sale at all, but a hiring. In the first type of transaction, the supplier loses all hold upon the goods, and the buyer becomes absolute owner. He can sell, pawn, or destroy the goods as he pleases, and is only responsible for the agreed price. Hence it will be appreciated that such a transaction with a fraudulent or unsubstantial buyer offers little security for the supplier. The buyer may dispose of the goods and neglect to pay, and if the seller sues him for the price, the buyer may turn out to be a man of straw.

On the other hand, in a hiring agreement the supplier remains the owner of the goods all the time until the full number of instalments have been paid. If the buyer makes default by selling or damaging the goods or by not keeping up the instalments, the supplier may take back the goods without any obligation to return any part of the money paid. Moreover, the buyer (or hirer as he should be called) can be sued for damages, and anyone to whom the buyer has re-sold the goods can be sued by the real owner for keeping them.

Thus a very great distinction must be made between the "deferred payment" system and the "hire-purchase" system. Sellers are apt to confuse the two, and judging from current advertisements and trade literature, the distinction is not always appreciated. Whether a particular transaction falls within either class will depend on the terms of the agreement, which should always be in writing (although this is not legally necessary) and stamped with a 6d. stamp. Any words indicating that the supplier is to remain the owner, or that the payments are to be for hire and not as payment of the price, will suggest a hire-purchase agreement, but the use of the words "easy terms" or "instalments" will not.

There are numerous agreements which fall on the dividing line between the two classes, having certain features belonging to one class and at the same time having similarities to the other. And the difficulty is not always overcome by the use of such words as are mentioned above. For courts of law do not look at an odd word or two, but to the whole of the circumstances.

It is important, however, that a line should be drawn; for the Sale of Goods Act provides that where a person "having bought or *agreed to buy* goods" obtains possession of them with the seller's consent, any transfer by the buyer to an innocent third party shall bind the original owner. This means, as was pointed out above, that a person who buys goods can re-sell them even though he has not yet paid for them, whereas a hirer of goods cannot dispose of them. If he does, the owner can reclaim them from any person into whose hands they have come.

But the Sale of Goods Act includes persons who have agreed to buy, in the class of persons who can dispose of the goods to a third party. It has been held by the Courts that a hire-purchase contract which provided that the hirer should have the goods, pay rent for them, and become owner when twelve payments had been duly made, was a person who had "agreed to buy," *i.e.*, had agreed to become a buyer when twelve payments had been made. And the same was held in a case where the agreement said that the buyer should, when all the rent had been paid, become owner on payment of one shilling. The result was that the buyer, who had sold the goods to a third party, was able to defeat the owner's rights. The owner could not recover the goods; all the could do was to claim the unpaid instalments.

The point which impressed the Court was that in neither of the above-mentioned cases had the buyer (or hirer) any power to return the goods. The agreement bound him to keep them, pay for them, and ultimately become buyer of them. Hence he was a "person who had agreed to buy."

The Court pointed out that if the agreement had said that the buyer could have at any time returned the goods without being under any further liability, the position would not have been the same. For if a person can send them back at any moment, sacrificing what he has already paid, but being under no further obligation, it seems obvious that he is not a person who has definitely agreed to buy them.

Suppliers should, therefore, make sure that all their hire-purchase contracts contain the following or some similar clause: "The owner agrees that the hirer may at any time terminate the hiring by delivering up the goods to the owner, the hirer still being liable to pay any rent due up to the termination of the hiring in this manner."

There is no doubt that suppliers would be well advised to have their agreements drafted by some competent lawyer who knows the conditions of the trade. Conditions vary according to the type of goods sold: some goods deteriorate quickly, some are liable to damage, some require frequent adjustment or repair, and others are fitted as fixtures to the hirer's premises. All these varieties of circumstance need to be taken into account, so that the owner's rights over the goods, and the condition of the goods while out of his possession, may be safeguarded. And the law relating to this class of transaction is full of difficulties for the owner, without adding to them by blunders in the agreement.

The Electrical Industry Reviewed.

The Annual Report and Meeting of the B.E.A.M.A.

WE have received a copy of the speech delivered at the annual meeting of the British Electrical and Allied Manufacturers' Association, held on March 17th, by the Chairman, Lt.-Col. R. K. Morcom, C.B.E. The Press luncheon, at which the chairman's speech has been given for several years past, was not held this time. We give an abstract of Col. Morcom's review and our usual full summary of the report of the Council. The report does not on this occasion mention whether there was any change in the total membership during 1926. Col. Morcom has been re-elected Chairman of Council for the third year.

The Electrical Industry in 1926.

By Lt.-Col. R. K. Morcom, C.B.E. (*Abstract.*)

At the beginning of 1926 the factors favouring an expansion of trade justified optimism; but any forecast was bound to be overshadowed by the menacing situation in our coalfields and the artificial stimulus to German activities inherent in the Dawes Scheme. During the year, inflation in France and Belgium increased the adverse factors through the consequent increase of production in those countries. Nothing but a rapid increase in world demand could possibly prevent a serious over-production crisis in Europe. Unfortunately, on a falling market demand always lags. As a result there was soon acute depression in Germany, and a threat of acute depression in all producing countries. It might have been possible to curtail production by international agreements, but, as these were either impossible or undeveloped, it soon became obvious that the coal strike could by no means be averted. This had the effect of cutting down our production to such an extent as to save Europe from catastrophe, but at terrible expense to Great Britain. France and Belgium showed a steady increase in production, and Germany made good her initial depression. Only late in the year, Italy suffered from an adverse credit position. Outside Europe, Chile suffered severely, both from the rapid decline in the price of copper and the keen competition of German potash. In Argentina, the meat war continued to be a cause of depression. In Brazil, futile attempts at stabilising the milreis still restricted trade. There was an increased producing power of the Indian people, which, along with the stabilisation of the rupee, produced an active market. The United States, with its tremendous internal wealth, produced record results in almost every industry.

The two dominating factors have been the coal crisis and the Electricity Supply Act. The shortage of fuel due to the strike brought into great prominence the efficiency and economy to be derived from electrification; the highly-electrified industries were able to keep up their outputs with few exceptions. The electrical manufacturers themselves were able to do a large turnover during the crisis, and only in the autumn began to feel the pinch of inadequate steel supplies.

The passing of the Electricity Supply Act co-ordinates the problem of generation and transmission of electricity in this country, and ends the uncertainty of the previous four years.

The Association supported the Bill and can take to its credit several good features embodied in the Act. The influence of the national scheme will clearly be felt more directly by makers of heavy generating plant, cables, and switchgear, than by the makers of small plant, but the fear that the extension and installation of private generating plant will be much affected is probably groundless. It is very improbable that the coal, iron and steel industries, and those requiring process steam, will find any advantage in taking power from the network.

Industrial power stations should be encouraged to provide power supplies for their own requirements from waste gas or low-grade fuel or as a by-product of process steam. Such surplus, if it could be absorbed into the distributing network, would increase the overall efficiency of generation. The Central Electricity Board has full powers to encourage development on such lines. The definition of costs of production in the generating stations is such as to allow a fixed and equitable return on capital expended or invested. This should encourage the use of plant of the highest efficiency and durability, and discourage the purchase of inferior plant merely to incur low initial outlay.

During the acute depression the electrical industry was the one bright spot, and certainly in generating plant, transformers, switchgear, control gear, and meters, there was a good increase in turnover. Unfortunately, in industrial motors there was again a serious decline in orders. Such a decline means that our other industries are insufficiently electrified, and are thus handicapped in the fierce race of modern trade. The electric motors installed in industry in the United States were actually 22,247,660 h.p. in 1924, and are estimated to exceed 24,000,000 h.p. to-day. The German census of 1925 shows 13,000,000 h.p., while, in this country, a maximum estimate is 5,000,000 h.p., of which our three large industries, iron and steel, coal, and textiles, account for 2,800,000 h.p.

Generally the turnover for the industry in 1926 was a record, but the record was really by way of an overflow of pent-up waters. The demand for electricity was increasing at the rate of 700,000,000 kWh per annum, sufficient to cause a demand for 500,000 kW of new plant, apart from renewals. Probably 600,000 kW total should have been required for public supply alone. Actually, the total sanctioned by the Electricity Commissioners averaged 425,000 kW for the period 1920-25, while for 1925-26 585,700 kW was sanctioned. We seem to show a deficit of at least 600,000 kW from normal, and this deficit will have considerable influence on the trend of our business. This country is not spending enough on its electrical development. In the United States, public utility companies raised £300,000,000, while here the maximum annual expenditure on generation, transmission, and distribution is about £30,000,000. Allowing for the difference of population, we are only spending 25 per cent. of what we should compared with the U.S.A. There is hope of rectifying the position, for a number of super-power stations have been begun or projected, aggregating 2,000,000 kW at full development.

The British electrical industry has been able to maintain its position as leading supplier of electrical goods abroad. The Monograph submitted to the International Economic Conference shows how, compared with Germany, the United States, and Switzerland, we have moved much more rapidly since 1913, and strengthened our hold on overseas markets. In seven years we have supplied generating plant aggregating almost 2,000,000 kW, and the results obtained from such plant have been sufficient to create a tradition of high operating efficiency in every part of the world. In traction, in control and switchgear, in transformers, the same record has been achieved, and the electrical industry, with exports totalling £18,194,000 in 1926, takes first place among the engineering exporting industries of this country. Competition was felt most in South America, India, and Australia during 1926, and, in each case, the United States constituted the main opposition. With the possible exception of Australia, which is still supporting United States products in many branches of the industry, the British manufacturer was actually able to improve his position in almost every market. In Brazil, in Argentina, in Chile, in Japan, and even in Canada, the relative position occupied by Britain showed a considerable improvement. Trade is being resumed also with the Continental countries, and a number of important orders, which would otherwise have gone to Germany or the United States, were secured, especially in Spain and Central Europe. Our financial resources are great enough to ensure us a preferential position, and are now being employed with favourable results in Eastern and Central Europe.

Looking at the general industrial situation, the indications do not seem to be towards any great expansion of trade. A certain number of orders held up by the coal stoppage and now placed give an appearance of activity to certain areas, but behind it all lies the great shadow of serious world under-consumption of basic products. And in this restricted market our powerful competitors make it certain that our difficulties will become increasingly great. German industrial firms have borrowed from the United States over £60,000,000 worth of new capital, the main industries affected being coal-mining, iron and steel, electricity supply, and electrical manufacture, while the financial resources of the country have increased so greatly that the manufacturers can obtain advances at a discount rate even less than that ruling in this country. A year ago, the German manufacturer had to pay at least 10 per cent. for such accommodation, but now he can obtain it easily at 4-5 per cent. This is a factor of very great importance indeed in important long-term contracts.

Another factor that has assisted the German manufacturers, particularly the electrical manufacturers, is the closeness with

which the financial policy of the State has adapted itself to industrial policy. As an instance, the Russian credits totalling £15,000,000 with State support have enabled German industry to adopt a very forward policy in the Russian market. In the present state of demand, it seems wise to encourage any market that has great expansive possibilities. The realisation of stable monetary conditions on the Continent has been attended by an increase in unemployment. The growth of rationalisation, the development of horizontal trustification in Germany, accompanied by amalgamations on a large scale, and the formation of a number of international agreements have tended to bring the main industrial countries of Europe into close contact with each other, with the result that something like a European economic *bloc* is emerging.

The artificial aids to competitive efficiency represented by currency depreciation and inflation generally have now been practically removed, but in their place has come a more determined Protectionist policy and a movement towards association of producers, both technical and financial. There are signs also that a number of important markets are suffering from depression—Japan, China, Chile, and Egypt, chief among them. The great upward movement in American production has come to an end, activity in January being the lowest recorded for the last three years.

Until prices move upwards again, which possibly may take place towards the latter half of this year, it is difficult to see how demand on export account will improve; our prosperity as an industrial and trading nation depends on continuous activity in world trade. The Dawes Plan represents a great menace to British exporting industries. We can feel it already in the intensified competition which we are suffering from Germany, while it has served to bring France, Germany, and the United States into closer co-operation with a view to dominating the world markets. Germany has already made inroads on our position in cables and industrial motors, though we have held our own in generating plant and traction material. But it is essential that we should work at maximum efficiency and retain our position. The best means to such an end is to strengthen and develop the home market. In the heavy sections, the programme already sanctioned, and those which will be stimulated by the operation of the Electricity Act make an improving home demand probable. The new spirit, which the discussions on the Act have encouraged, and the need for bringing industrial plants up-to-date, should stimulate a revival in demand for medium and small size plant. In particular, all possible should be done to stimulate the demand for industrial motors, and so not only reduce the depression of that section, but put them in a position to face world competition on the basis of a home demand more comparable with that enjoyed by their great rivals.

The Council's Report.

THE Council commences its report by stating that, though 1926 began with every indication of expanding trade, it was one of the most disappointing in post-war history. The coal stoppage and the general strike brought industrial production almost to a standstill; trade suffered both from the interruption of manufacturing activity and from the diversion to competitors of orders in many important markets. Complete recovery will take some time, but the opinions of leading banking and industrial authorities indicate hopeful prospects of trade revival.

"The creation of stable currency systems in Europe—France and Italy alone have not taken steps to stabilise financial conditions—points to the elimination of unfair competition based on currency depreciation, and an improvement in the competitive situation so far as the British manufacturer is concerned. The rapid fall in prices of many basic commodities such as copper, cotton, lead, rubber, and chemicals, has contributed to a slight decrease in material costs, but, on the other hand, has weakened the economic and financial position of many markets, such as Chile, Central Africa, Egypt, and made overseas demand less active." The electrical industry, due to the fact that many plant extensions could no longer be delayed pending the new supply legislation, was an exception to the general depression, and reported an increase both in turnover and in orders received. The passage of the Electricity (Supply) Act released several large power schemes, and there is hope of increased activity during 1927, provided that all sections of the community realise the necessity of working together towards stability. The B.E.A.M.A. office accommodation was increased during the year.

Sir Robert Horne, P.C., M.P., Mr. Emile Garcke, and Mr. C. P. Sparks have been elected vice-presidents. Captain R. S. Hilton, managing director of the Metropolitan-Vickers Electrical Co., Ltd., was elected vice-chairman of Council in June, in place of Mr. P. J. Pybus, who retired on becoming chairman of the English Electric Co., Ltd.

The Electricity (Supply) Bill) came into force as an Act on January 1st of this year. "It is obvious that developments will take some time to mature under the Act, and an effort will probably be made, first of all, to determine the seven electricity districts still in abeyance and to complete the series of 15 districts into which Britain has been divided, before any steps will be taken towards realisation of a plan of national co-ordination."

A tribute is paid to the director, Mr. D. N. Dunlop, who, with the sanction of the Council, brought together the various bodies in the electricity supply and contracting branches of the industry, with the result that their interests were reconciled and an agreed clause was presented to the Ministry of Transport, which now stands as Clause 48 in the Act.

Since the last Annual Report, the enlarged British National Committee referred to therein has assumed responsibility for the participation of Great Britain in the future activities of the World Power Conference; the director is chairman of this Committee. The first sectional meeting of the World Power Conference was held at Basle, Switzerland, during the year, and the Sectional Meeting on Fuel Problems will be held in London in September, 1928, under the auspices of the British National Committee.

The report refers to the monograph on the electrical industry, prepared in connection with the International Economic Conference of the League of Nations, which was reviewed in the Electrical Review, March 4th, p. 329.

The Economic and Statistical Department of the Association considerably extended its range of activities during 1926. It has kept in touch with financial and commercial interests; it has been consulted by international bodies, such as the International Economic Conference, regarding developments in industry; has furnished information to the International Labour Office and the Board of Trade Committee on Industry and Trade; has exchanged statistics with leading associations in other countries; and serves to guide the course of expert opinion on the electrical industry.

Reference is made to the various publications issued by the Committee, and to the various articles in newspapers at home and abroad regarding the British electrical industry. The advertisement campaign of the Publicity Department directed to increasing the prestige of the industry is mentioned. The same department supplied information to other associations in support of electrical development, and was active in many of the Dominions, syndicating special articles and notices dealing with the electrical industry. In conjunction with the Economic and Statistical Department it has been working to create an atmosphere favourable to intensive electrical development and the realisation of large power schemes, both at home and abroad.

The sixth annual report of the Electrical Research Association makes it clear that the E.R.A. has now thoroughly established its usefulness. The Council regards the work of this Association as of national importance.

The scheme of educational scholarships, which has been in successful operation for the last six years, was brought to a conclusion during the year, the funds for it having come to an end. The Committee has laid down lines for an enlarged scheme, which proposes to open out the awards both as to subject-matter and the field from which candidates may be drawn. The number of oversea students in members' works at the close of the year was 162, a decrease of 22 on last year's return.

With regard to conditions of contract, the report says:—"The routine work in the legal department is reported by the solicitor as having been normal during the year, but he desires to draw the particular attention of members, when examining their contracts, to the preliminary portion of them embodying what is known as the 'Agreement.' The 'Agreement' always refers to the set of conditions 'annexed hereto,' and not infrequently it happens that it contains clauses which are contrary to and *override* those conditions. Such words are sometimes overlooked by the examiner of the contract, once he has been satisfied that the conditions annexed thereto are in order. Particular care should therefore be taken in reading the 'Agreement,' and any dubious points referred to the Association. No alterations in the text of the I.E.E. model sets have been proposed during the year."

An important addition was made to the Council's "Instruction to Members" in regard to fair-wages clauses. After 12 months' experience of the voluntary use of two out of the three well-known clauses and several years' experience of the first (*i.e.*, dealing with labour in the factory), the Council decided that all these clauses should be made mandatory, and accordingly that rule was put into effect last autumn. "No serious difficulty has yet been encountered, and it is hoped that in due time most public bodies will follow the lead of the chief railway companies in arranging to accept clauses which, unquestionably, are, as their title correctly implies, 'fair' both to purchaser and contractor; and will, if not already in accord, gradually alter their standing orders to admit of their use."

An outstanding feature in connection with standardisation work during the year was the plenary meeting of the International Electrotechnical Commission held in New York in April. "An important principle recognised was that temperature *rise* (and not *total* temperature) is the fundamental basis of the I.E.C. rules for rating. It is gratifying to know that British practice, as enunciated by your representatives, is having its due influence on international standardisation."

The Standardisation Committee has completed a draft set of rules covering the method of declaring efficiencies for motors and generators, transformers, rotary convertors, and motor convertors. The draft was submitted to the I.E.C. and was referred to the National Committees for consideration.

Researches conducted by the E.R.A. on flameproof enclosures have made it possible to adopt a definition of flameproofness which has been embodied in a British standard specification. Specifications for flameproof apparatus are now under consideration.

During the past year the B.E.S.A. has registered "BESA" as a trade mark to be used on articles which comply with the appropriate British standard specification. Licences for the use of the mark are granted only under such conditions as will ensure that the articles so marked do actually comply. The introduction of this trade mark should be of the greatest service to British manufacturers.

A specification for lighting and power transformers which is the result of several years' work on the part of the Transformer Technical Committee is regarded by the B.E.S.A. Electrical Sectional Committee as one of the finest technical productions yet issued by that Association.

During the year the Traffic Committee continued its collaboration with the Traders' Co-ordinating Committee in opposing the Schedules of Standard Charges, submitted to the Railway Rates Tribunal by the railway companies. Its members also prepared special evidence on the companies' proposals with regard to Part 6 of the Schedules, which deals with "Merchandise of an exceptional character sent by merchandise train." In this term are included pieces of machinery exceeding 12 tons in weight. At the present time pieces of electrical machinery in excess of 10 tons in weight are surcharged on a rising scale, referred to as "The Heavy Weight Scale." Certain classes of machinery are exempt from these surcharges, being permitted to take advantage of a "mileage scale of charges." Under the schedules the mileage scale is to be abolished, and all pieces of machinery exceeding 12 tons will be subject to surcharge. The Committee regards these surcharges on electrical machinery as unjustifiable, and as a result of interviews with a committee representing the railway companies, it was agreed that the minimum weight should be raised from 10 to 12 tons, and that the surcharges should be imposed, not on the total weight, but on the excess weight over 12 tons. The companies further conceded the principle that the surcharges should not take the form of a percentage addition to the standard charges, but should be based on a sliding scale in which the price per ton per mile decreased with increasing distance. At a later stage the companies submitted to the Tribunal their proposed scale which commenced at 7d. per ton per mile for the first 10 miles, and decreased to 1d. per ton per mile for distances exceeding 100 miles. The Committee resisted these proposals, and the evidence submitted to the Railway Rates Tribunal, supported by considerable data in the form of tables and charts, showed that whilst relief had been given to purely electrical machinery, the new surcharges imposed on prime movers would, in many cases, make the cost of transport on a combined generating set greater than before. The railway companies then voluntarily agreed to reduce the proposed scale by 33⅓ per cent., and this reduction has since been confirmed by the Tribunal. The effect of this decision will mean that the carriage charges to be paid by the heavy-plant sections of the Association will be, at least, £3,000 per annum less than would have been the case under the railway companies' proposals, and will, in the majority of cases, be below the present charges. At the present time the difference between the charges at companies' risk and owner's risk is of the order of 10 to 20 per cent., depending on the class of goods, but in the companies' proposals the deduction is of the order of from 2½ to 12½ per cent., and the greatest volume of traffic will be carried in those classes for which the proposed allowances are respectively 2½, 3¾, and 5 per cent. The Committee will collaborate with other trading interests in resisting these proposals, but it is hoped that some satisfactory arrangements may be arrived at without having recourse to litigation. In settling the revised Classification of Merchandise, the Committee succeeded in obtaining modifications of the companies' proposals which will be of considerable benefit to members of the Association. Among these modifications was a lower classification of steam condensers, representing a saving in transport charges of about 20 per cent. The Committee has also been successful in obtaining a revised classification for ironclad switchgear.

The Committee reminded members that as their ordinary shipping policies did not protect them against damage due to fire and other causes which might occur in railway or dock warehouses in which their goods might be stored awaiting lifting on board, they should cover this risk by insurance.

In order to put an end to recurring disputes regarding loss and damage an agreement has been made under which, subject to certain conditions, the railway companies will pay the net loss less 10 per cent. when the goods are carted by the trader at one end of the journey, and less 15 per cent. when cartage is performed by the trader at both ends. This agreement came into force on October 1st, 1926.

The Export Committee gave further attention to the question of amendments to Dominion Customs duties, particularly those in Australia. To ensure adequate support for the memorandum transmitted to the Australian Customs authorities, those members interested in Australian business decided to appoint in Australia an Australian tariff expert to support the views put forward in the memorandum. Progress cannot yet be reported, but the effort is being maintained. The question of the import duties on catalogues charged under the Australian Customs tariff also received careful consideration with a view to action. During the year there were two conferences of all members of the Association known to be represented in Australia.

The two new sets of conditions of contract, to govern f.o.b. and c.i.f. contracts, were still under discussion by the appropriate I.E.E. Committee when this report went to press. The Export Committee devoted a considerable amount of time during the year to the conditions of the India Stores Department, and had the attendance at once of its meetings of Colonel Pitkeathly, chief engineer of that department, who, after hearing the manufacturers' views, undertook to give careful consideration to the Committee's suggestions for amending the department's conditions. The Committee also secured the interest of the chief inspecting engineer of the Egyptian Government in respect of conditions of contract.

In place of the November meeting of the Export Committee a conference was held of all members of the Association, known to be interested in Indian business, when Mr. T. M. Ainscough, H.M. Senior Trade Commissioner, Calcutta, gave his views regarding the present position and prospects of the British electrical and allied industry in India. Mr. Ainscough also urged that some arrangement should be made for the systematic training of accredited Indian students. The Export Committee joined in the general protest against the continuation of the Anglo-Spanish Commercial Treaty in view of the very high duties imposed by decree.

The Standard System of Cost Accounting in the Electrical Industry, prepared by the Estimating and Accounting Committee, has been completed, and is in the hands of members. The Council believes that its general adoption as a basis of costing will lead to greater efficiency in the industry.

The activities of the Electrical Development Association are briefly indicated in the report. Its supply membership at December 31st was: Municipal, 150; company, 125; colonial, 4; total 279; an increase of 27 on the preceding year. Its principal activity during 1926 included the organisation of the great campaign.

The following exhibitions were, during the year, made free to members under the Exhibition Standing Rule: Smoke Abatement Exhibition, Birmingham; Physical Society's Exhibition; Better Housing Exhibition, Glasgow; Clean Foods Exhibition, Cardiff; Heating and Cooking Exhibition (Clyde Valley Power Co.), Helensburgh; Heating and Cooking Exhibition, Pudsey Corporation; Office of Works Industrial Exhibition; Bakers' Exhibition, London.

The Council acknowledges the assistance received from other institutions.

Practical Results with Chromium Plating.

Under this title the *American Machinist* abstracts a paper read before the S.A.E. at Detroit, in which Mr. W. N. Phillips states that chromium plating has been used for considerably over a year on the Oldsmobile radiator. The method used is to produce as smooth a surface as possible, and then apply a light coating of chromium. In order to get this smooth surface, it is the practice to copper- and nickel-plate the steel parts; then, after the articles have been buffed to a high finish, a light coating of chromium is applied. It is somewhat difficult to produce nickel plating under 0.001 in. thick that will stand a salt spray test of 15 hours. However, a steel base, plated with this amount of nickel, then chromium plated, will stand 80 to 100 hours of salt spray test.

The chief material used in chromium plating is chromium trioxide, which can be purchased at about 35 c. per lb., with the possibility that, as the use increases, the price will decline. In applying chromium, high current densities are used with very short emersions (*sic*).

On plug gauges, thread gauges, and the like, the use of chromium has been very successful. The gauges are ground about 0.0005 in. undersize, then brought up by plating an excess of chromium, and later ground to size, or by plating the gauges exactly to size. When the gauge has finally worn out, it is stripped and a new coating of chromium applied. It is thus possible to use the same gauge for an indefinite period. It is in this work that the control of hardness is of particular importance. It has been possible to produce gauges that last from 2 to 25 times longer than the best steel gauges with one plating.

Owing to the low coefficient of friction between chromium and other metals, chromium has been applied for burnishing tools with a great deal of success. Files used for cutting soft metals can be chromium-plated with great advantage, inasmuch as the metal does not clog up the file.

It is necessary to back up chromium plating with hard metal, if the article plated is to be put to hard usage. In other words, if the impact is great, the steel parts should be carburised before applying chromium.

Hardening Copper.

The discovery of a new process for hardening copper was recently announced at a meeting of the American Institute of Mining and Metallurgical Engineering. Mr. M. G. Corson, a consulting engineer, who invented the process, explained that the copper was hardened by an alloy of 5 per cent. nickel and about 1 per cent. silicon, heated to various high temperatures. Virtually, the same principle was used as in making duralumin, another hard metal.—*Reuter's Trade Service* (New York).

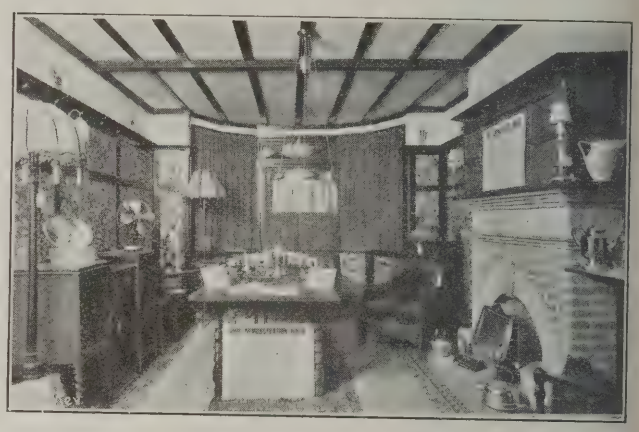
Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Campaign Notes, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

The E.D.A.-E.L.M.A. Campaign.

According to the official report for the week ended March 19th, 90 electric demonstration houses have now been opened, and it is conservatively estimated that 1½ million people have visited them. During last week houses were opened at Ipswich, Paisley (Ralston), and Stoke-on-Trent (two). Further houses are to be opened shortly at Whitley Bay, Malton, Heaton (Newcastle), Saltburn, Birmingham, Tamworth, West Hartlepool, and Annfield Plain. The following attendances are recorded at some of the demonstration houses:—Paisley, 400 a day during the first four days; Aberdeen, 16,736 in 16½ days—over 10 per cent. of the population; Glasgow (Minard Road), 12,133 in 12 days; Potteries, 1,000 on opening day; Chorlton, average over 1,000 a day. Between 8,000 and 10,000 people visited the four-day exhibition at Dumfries, and the results are said to be satisfactory. Recently a special effort has been made to interest school children in the better home-lighting competition, and applications have been received for nearly 80,000 booklets. The E.D.A.'s stock of posters, window bills and supplementary literature is practically exhausted; only a few hundred are left. Ballot papers have been coming in lately at the rate of two or three thousand a day; it is now certain that the public response to the competition compares favourably with any similar trade effort ever made in this country.

No. 8 of "Home Lighting News" calls for a big final "push" by electricity suppliers, contractors, and retailers. To encourage an effort E.D.A. offers to those who have previously ordered competition booklets, 50 per cent. of the number free of charge upon application. The March window display is dealt with; this concentrates upon spring cleaning, and is devoted to a contrast of ancient methods with the modern (vacuum cleaner) way of doing the work.



We reproduce herewith views of two of the demonstration houses equipped in connection with the Campaign.

The Carlisle Demonstration House.

The first is that at Carlisle, and appears to be a typical middle-class home, representative of a vast number.

The other house is at Hendon and our view shows the dining room containing a large number of electrical appliances, including five types of lighting fittings, and a number of table devices.

The Hendon Electric Home.

Another illustration is a night view of the South Shields Electric House. This is of the modern semi-detached villa type, and on the ground floor are a drawing room, dining room, kitchen, and scullery; upstairs there are a front bedroom, small front bedroom, and back bedroom, together with bathroom, &c. The house was loaned by the builder on completion. The wiring was carried out by a local firm of contractors, and the fittings, cooking apparatus, &c., were from several manufacturers. The furnishing was done by a local firm. The house was formally opened by the Mayor (Councillor J. Ranson) on March 9th. After the opening and inspection of the house, those invited were entertained to tea. The number of people who visited the house on the first day was 3,000. Up to March 17th the total number of visitors was 13,588. Attention was drawn to the house by a number of effective methods. The whole of the work was carried out by the local circle in conjunction with local wiring contractors and other co-opted members.

An All-Electric House at South Shields.

An all-electric house was formally opened at Taunton by the Mayor on March 11th. The exhibition was organised by the Taunton Electric Circle and domestic labour-saving devices, together with a variety of other electrical appliances, are included in a very complete display.

Two neighbouring all-electric houses were opened at Shelton, Stoke-on-Trent, on March 17th, and they are to remain open until the end of the month. The houses were erected by the Corporation Housing Committee and furnished by two local firms. The electrical equipment was supplied by the City Electricity Department. A leaflet is being distributed giving some details of the exhibition and also calling attention to the Campaign competition. The local Press has been freely employed to advertise the houses, and one advertisement gave the names and addresses of 22 electrical contractors, &c., from whom competition booklets can be obtained.

Local Exhibitions.

Cardiff.—The accompanying picture shows the Cardiff all-electric house, to which we recently made reference. It was erected by Messrs. G. L. Ward & Co., and furnished and

An All-Electric House at Cardiff.

equipped by Messrs. David Morgan in conjunction with the builders. In its general design it followed the lines of the prize house which is being awarded in connection with the E.D.A.-E.L.M.A. Campaign.

Yarmouth.—An electrical exhibition, organised by the Electricity Department, was held at Yarmouth from March 15th to 24th. A number of local electrical contractors co-operated, and the products of several national manufacturers were displayed. A booklet was issued for the occasion in which were set out full particulars of the Corporation's service as well as the advantages of "doing it electrically." Cooking demonstrations were given by a representative of the Jackson Electric Stove Co., Ltd., whose cookers form a part of the Corporation's hiring scheme.

Electric Power in Industry.

The fourth preliminary report upon the Census of Production, 1924 (published with the *Board of Trade Journal* for March 17th), shows that in the coal-mining industry generating plant of a total capacity of 778,363 kW was in use during 1924 (as against 151,000 h.p. in 1907). The total power of electric motors installed was 1,568,360 h.p., and power for 1,030,139 h.p. of these was generated by the industry itself. In 1907 the aggregate h.p. of electric motors installed was 492,000. Electricity to the value of £112,000 was sold by the industry during 1924. The coke and by-products industries reported generating plant with a total capacity of 37,264 kW. The installed electric motors had an aggregate rating of 69,043 h.p. The manufactured fuel trade possessed 2,983 kW of generating plant (against 239 kW in 1907), and had 5,525 h.p. of electric motors installed. The generating plant installed in the railway carriage and wagon-building trade aggregated 15,207 kW (against 8,168 kW in 1907). and the industry had 62,506 h.p. of electric motors.

Recent Contract.

Messrs. E. A. Langrish & Co., Ltd., Wardour Street, W.1, have obtained a contract for installing complete kinematograph equipment at the Nottingham City Mental Hospital, Mapperley. This is only one of the many similar installations carried out during the past few months. The projector outfit supplied is a "Kalee" all-British No. 7 model of the rear-projection type, the projector being placed at the rear of the screen.

Commercial Electrical Travellers.

The Electrical Trades Commercial Travellers' Association held a successful carnival dance at Victory House, Leicester Square, on Friday evening last, about 100 members and friends being present. Despite the mild weather, exponents of the Charleston were indefatigable, and Mr. Tom Dally's orchestra, which once again provided the music, was busily employed in meeting their demands. The profuse distribution of fantastic paper hats and other novelties enlivened the proceedings, which were consecrated by the singing of the Frothblowers' Anthem. The catering, as usual, was excellent, and Mr. Moir, hon. secretary, and those who assisted him in making the arrangements, are to be congratulated on their efforts.

Power in Factories.

The monthly *West Ham Power and Factory Gazette*, published by the West Ham Electricity Department, contains particulars of factories and factory sites available in the district, as well as numerous illustrations of the application of electric power to industry. Full details of the Department's service are included.

Employment During February.

The March *Ministry of Labour Gazette* states that employment in the engineering industry continued to improve during February in all parts of the country. The general percentage of unemployed fell from 13.1 in January to 11.6. In the electrical engineering branch there was a fall in unemployment from 6.8 to 6.5 per cent. Upon the other hand, the two other principal electrical groups showed a decline in employment. In the electrical wiring and contracting industry the unemployment figure was 8.9 per cent. (against 8.0 per cent. in January), and in the electrical cable, wire and lamp manufacturing group it was 8.6 per cent. (against 8.3 per cent). The actual numbers of unemployed were as follows:—Electrical engineering, 4,995; wiring and contracting, 1,237; and cable, wire and lamp manufacturing, 7,595.

Cheaper Electric Lamps Wanted.

A plea for cheaper electric lamps was made by Mr. E. Cross, the Rotherham electrical engineer, at the annual dinner of the Sheffield branch of the Electrical Contractors' Association last week. They were now getting a class of consumer of electricity, he said, who could not afford to pay 3s. or 3s. 6d. for a lamp. It would pay manufacturers to sell lamps cheaper and, in consequence, more of them.

Unemployment.

The fall in the number of employed continued during the week ended March 7th, when a reduction of 25,380 was recorded. The actual total was 1,144,100, as compared with 1,169,480 on February 28th, and 1,094,082 on March 8th, 1926.

A "Rawlplug" Competition.

In our advertisement pages to-day details are given of a competition which is open to all users of "Rawlplugs," and particularly electricians. A number of attractive cash and other prizes are offered.

The Japanese Earthquake.

The recent severe earthquake in Japan caused comparatively little damage, the total being officially put at 10 million yen. The property of the Tokyo Electric Light Co. was not seriously affected; the estimated cost of the damage done is stated to be £4,000.

Metropolitan-Vickers in Russia.

The Times reports that a five-year agreement between the Leningrad Machine Trust and the Metropolitan-Vickers Electrical Co., Ltd., has been approved by the Soviet People's Commissars. The Trust obtains access to all the Vickers laboratories, workshops, and technical offices, as well as to all patents. Messrs. Vickers will send to Russia a certain number of engineers, mechanics, and technical *personnel*.

Lamp Manufacture in Russia.

In order to render the country less reliant on foreign tungsten wire, for use in the manufacture of electric lamps, plant for its production has recently been installed at the Baskakow cable works in Moscow, where about 328,000 ft. per month is now being turned out. A tungsten wire-making plant is also being established in the old Provodnik works, Leningrad.

Proposed New French Customs Tariff.

The *Board of Trade Journal* for March 17th was accompanied by a translation of the first part of the new Customs tariff which the French Government has under consideration. The principal object of the revision is to ensure, for a number of years, the defence of the national industries. An important feature of the new tariff is the provision made for the periodical adjustment of the rates of duty in relation to changes in the general level of wholesale prices.

The National Radio Exhibition, 1927.

The Radio Manufacturers' Association states that full particulars of the 1927 exhibition will be published in the course of next month. It is the intention of the Association to afford its members special facilities on one day to view the show.

North Metropolitan Progress.

The Spring Number of "Use Electricity," published by the North Metropolitan Electric Power Supply Co., shows that during 1926 no fewer than 7,274 new premises were connected to the company's system. In the same issue are articles upon the company's demonstration houses; the electric kitchen; shop-window lighting, &c.

Trade Announcements.

Mr. Frank Gilman has removed his office to Grange Works, Grange Road, Smethwick.

Mr. A. J. Wells, electrical and radio engineer, has opened new premises at 5, Crawley Green Road, Luton, Beds.

The Electricity Distribution of North Wales and District, Ltd., is shortly opening offices and showrooms at Nantwich.

Messrs. Kent Bros. Electric Wire Co. & E. H. Phillips, Ltd., state that on April 1st their registered offices and stores will be removed to West Park Works, Mortlake Road, Kew Gardens, Surrey ('phone: Richmond 3941). For local customers a stores will be retained at 43, Berners Mews, London, W.1.

As from to-day, Mr. A. J. Makower's address will be: 200, High Holborn, W.C.1. Telephone: Museum 4265.

Catalogues and Lists.

Messrs. F. & A. Parkinson, Ltd., Guiseley, Leeds.—A blotter advertising the company's motors and bearing a view of the works.

Volta, Ltd., Kern House, 36-38, Kingsway, W.C.2.—Two pamphlets addressed to retailers dealing with the company's sales policy, and three illustrated leaflets describing "Volta" vacuum cleaner attachments. Also an adhesive stamp advertising the "Volta."

Messrs. Walter McGee & Son, Ltd., Albion Works, Paisley.—Leaflets Nos. 110-114, illustrating and describing "Emcol" a.c. motors, including a special flameproof (mining) type.

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—A priced and illustrated catalogue of ironclad switch- and fuse-gear. Views of the company's Witton works are included.

Messrs. Royles, Ltd., Irlam, near Manchester.—A folder advertising the company's water and air heaters, strainers, &c.

Messrs. Tipper Bros., Bradley Bridge Tube Mills, near Bilston, Staffs.—A pamphlet advertising the firm's "Tibro" electrical conduits ranging from ½ in. to 2 in. external diameter.

Messrs. A. H. Hunt, Ltd., Tunstall Road, Croydon.—A sample of "Clutch" insulating tape, a feature of which is the retention of its adhesive properties for a very long period.

Mr. Alan Wright, 124, Chancery Lane, W.C.2.—A cut out containing details and prices of "Inventum" electric cisterns and arranged for overprinting.

Pritchett & Gold & E.P.S. Co., Ltd., 50, Grosvenor Gardens, S.W.1.—A brochure containing very full particulars of the construction and manufacture of the company's accumulators for train lighting.

Mr. Charles Selz, 47, New Cavendish Street, W.1.—A leaflet bearing a view of Mr. Selz's showrooms, and (on the reverse) a guide to their position.

The Benjamin Electric, Ltd., Brantwood Works, Tariff Road, Tottenham, N.17.—A priced and illustrated folder describing "Bencolite" units for artistic lighting.

Messrs. Ernest F. Moy, Ltd., Greenland Place, Camden Town, N.W.1.—Sheet No. 150, containing an illustrated description of the company's large motor-operated rheostats. The example depicted has a capacity of 470-160 A, and a resistance of 1.1 ohms.

Houghton-Butcher (Gt. Britain), Ltd., 88-89, High Holborn, W.C.1.—"Houghton's Radio News" for March, containing details and prices of radio apparatus, special lines for retailers, and illustrated articles on selling, &c.

The Vaughan Crane Co., Ltd., Openshaw, Manchester.—Booklet 261, describing the company's pulley blocks, &c.

Bankruptcy Proceedings.

A. J. Garrod, Whitehorse Place, Wellingborough, Northants, radio manufacturer.—The receiving order in this matter was made on March 4th on a creditor's petition. The statement of affairs shows ranking liabilities of £2,947, against assets of £466, leaving a deficiency of £2,481. The debtor attributes his failure to the calling in of borrowed capital when his experiments were in a critical stage and not quite perfect. It appears that he was formerly interested in wireless in Australia, and in May, 1924, came to England with £600 free capital. In the following September he started trading as the Unitron Valve Co. at his present address with £350 capital, and was successful until August, 1925. He borrowed £250 as he was experimenting on a wireless valve, and this was afterwards increased to £750 with a further £250 guaranteed at the bank. Later he borrowed £750 from the petitioning creditors. In November, 1926, he endeavoured to form a company to exploit his wireless valve, but he was unable to do so, and in December he closed down.

G. E. Grainger, trading as Grainger & Co., 38, Market Street, Ashby-de-la-Zouch, wireless engineer.—The first meeting of creditors was held on March 16th, at the Official Receiver's office, Nottingham. The debtor's deficiency was put at £571. He attributed his failure to bad trade, lack of business experience, loss on contracts through underestimating, and living beyond his means. He commenced business with his brother in April, 1925. They had no capital but each contributed a quantity of wireless accessories to a total value of about £40. In June of the same year, trade not being good, his brother retired and debtor continued the business. He admitted having been aware of his position shortly after he commenced business. The case was left in the hands of the Official Receiver as trustee of the estate.

E. Cowley, trading in co-partnership as George Hill & Co., 22, Chantry Lane, Great Grimsby, electrical engineer.—The application for the discharge of this debtor was heard on March 17th at the Town Hall, Great Grimsby. He was a partner in the firm of George Hill & Co. He joined the firm in November, 1920, supplying £150 capital, money loaned by his father. The partnership liabilities amounted to £652, against assets of £262. It was stated that the firm was in difficulties when debtor joined. The debtor's discharge was granted subject to a suspension for one year.

G. Mason & G. E. Tinsley (Mason & Tinsley), electrical engineers, 6, Alberta Terrace, and 94, Upper Parliament Street, Nottingham, and G. Mason (separate estate).—Last day for proofs for dividend March 30th. Trustee, Mr. L. A. West, Official Receiver, 4, Castle Place, Nottingham.

P. Ford, electrical contractor, 4a, Macdonalds Lane, Corporation Street, Manchester.—Receiving order made March 14th, on a creditor's petition.

A. Stock, electrical and radio engineer, 323, Chapel Street, Salford.—Receiving order made March 16th, on debtor's own petition.

R. A. Burnell, electrical engineer, Harefield Park, Harefield, near Uxbridge.—Trustee, Mr. T. Gourlay, Official Receiver, 29, Russell Square, W.C., released March 10th.

F. A. & R. Hartley (F. A. Hartley & Son), electrical engineers, 98, Katherine Street, Ashton-under-Lyme.—First and final dividend of 3s. 6½d. in the £, payable March 28th, at the Official Receiver's offices, Byrom Street, Manchester.

F. A. Hartley (separate estate).—First and final dividend of 20s. in the £, payable March 28th, at the Official Receiver's offices, Byrom Street, Manchester.

R. Hartley (separate estate).—First and final dividend of 20s. in the £, payable March 28th, at the Official Receiver's offices, Byrom Street, Manchester.

J. V. Figgins (V. Figgins), plumber, sanitary and electrical engineer, &c., 97, Fore Street, St. Marychurch, Torquay.—First and final dividend of 1s. 9d. in the £, payable at the Official Receiver's offices, Exeter Bank Chambers, 67, High Street, Exeter.

T. F. Collier, electrician, 116, Union Street, West, Oldham.—Receiving order made March 11th, on a creditor's petition.

R. P. Reeves (Lux Spotlight Projector Co.), electrician, 5, Say's Corner, North Quay, Great Yarmouth.—Public examination held March 23rd, at the Town Hall, Great Yarmouth.

Company Liquidations.

Gil-Ray Trading Corporation, Ltd., Sicilian House, Sicilian Avenue, W.C., radio and electrical manufacturers.—A meeting of creditors was held at the company's offices on March 14th, when Mr. S. B. Saunders, liquidator, presided. A statement of affairs was presented, which showed liabilities of £2,023 and an estimated amount available to meet the debenture holders' claim of £78. The deficiency, so far as the creditors were concerned, was £2,023. The liquidator said that there would be nothing for the unsecured creditors. The capital issued and allotted was 1,002 preference shares of £1 each, and 2,000 ordinary shares of 5s. each, so that the total deficiency as, regarded contributories, was £3,525. The company was formed in July, 1925, with a cash capital of £1,000, and in May, 1926, a further £500 was put into the business, which amount was secured by a debenture. During the early part of the company's trading it did fairly well, and good orders were received for a crystal which it manufactured. Soon after, the slump in the wireless trade set in, and business became very bad. It was hoped that increasing trade would be brought about by the Manchester Exhibition, and the company had a stall there, and a great deal of time was spent on it. Things did not turn out as anticipated, however, and the exhibition authorities refused to allow the company's stock to be taken away. Consequently the debenture holder appointed a receiver. The present directors had not drawn any fees since the commencement of the company. The debenture holder was also a director of the company, and besides advancing the £500, which was secured by the debenture, he had also loaned sums from time to time without security. At the present time he stood to lose about £2,000. It was resolved that the matter should be left in the hands of the present liquidator. The following are creditors:—

	£		£
Gaskill, —	250	Auto Sundries	59
Barney, —	56	Hirst Bros.	23
Fuller's United Electric Works, Ltd.	35	Yeoman, —	68
		Johnson, A. E.	76

Evalasio Distributing Agency, Ltd., 49, Leswin Road, Stoke Newington, London, N., and Cross Street, Islington, wholesale and retail wireless dealers, &c.—A meeting of creditors was held on March 11th at the offices of Messrs. Hacker, Rubens & Co., 23, Surrey Street, W.C. The chair was occu-

pied by Mr. M. G. Hacker, liquidator in the voluntary liquidation of the company and receiver for the debenture holders. He stated that the liabilities were approximately £325 to the trade and £150 to cash creditors. The assets were apparently sufficient to fully discharge the amount due to the debenture holders, but as far as he could see, there would be no surplus available for the unsecured creditors. The company was incorporated on February 7th last to take over the business of the Evalasio Distributing Agency previously carried on by Messrs. W. H. Stevens and E. F. Keal at Stoke Newington, and that of the Edal Wireless Co., at 2, Cross Street, Islington, N. Part of the consideration for the transfer of the assets was the issue of two debentures totalling £850 to two cash creditors who had advanced money to the Evalasio Distributing Agency. The company had a nominal capital of £100 in £1 shares. No resolutions were passed, and the voluntary liquidation of the company will therefore be continued with Mr. Hacker as liquidator.

Joseph Booth & Bros., Ltd., electrical engineers and crane manufacturers, Rodley, near Leeds.—A meeting of creditors was held at Leeds on March 18th. The liquidator, Mr. Alfred Walton, presided. The statement of affairs presented showed unsecured creditors for trade accounts, £9,427; unsecured loan creditors, £32,028; fully-secured creditor, £45,977 (being the bank, which held a debenture for £50,000); and preferential creditors, £3,773. The net assets were estimated at £13,233, leaving a deficiency of £28,221. Mr. Reginald Armstrong, solicitor to the company, said that Mr. Walton was appointed receiver by the debenture holders on February 21st last and as liquidator on March 2nd by the shareholders. After a number of questions had been asked and answered, it was decided to leave the matter in the hands of the liquidator, with the following as an informal committee of inspection:—Messrs. H. E. Catton (Catton & Co., Ltd., Leeds), Douglas Illingworth (Douglas Elliott & Co., Ltd.), Raymond Hartley (Clayton & Co., Ltd.), J. Blackett (Blackett, Hutton & Co., Ltd), and A. Cripwell (Corfield & Cripwell).

The liquidator pointed out that at the moment there was nothing definitely decided as to whether the business should be carried on or wound up, but in the course of the next fortnight he was seeing some people regarding the future of the company. The latter had several contracts on hand, but it was not yet quite certain that it would complete them. If there was a chance of completing the contracts profitably, it would be done. The following are creditors:—

	£		£
Blackett, Hutton & Co., Ltd.	614	*Iron and Coal Trades Review*	152
Catton & Co., Ltd. ...	208	Iron Trades Employers' Ins.	116
Clayton, Hy., Ltd. ...	333	London Elect. Wire Co. and Smiths, Ltd. ...	140
Clayton, Son & Co., Ltd.	146	Lilleshall Co., Ltd. ...	162
Chloride Electrical Storage Co., Ltd.	759	Leigh & Sullivan, Ltd.	111

Hartley, W. Y., & Son	366		
Hanson, B. & S. ...	147		
Helme, Edwd., & Co., Ltd.	525		

Autoveyors, Ltd., wireless contractors, 84, Victoria Street, S.W.1.—A meeting of creditors was held on March 15th at the company's offices. The chair was occupied by Mr. E. W. Dilley, who had been appointed to act as the receiver for the debenture holders, and as the liquidator in the voluntary liquidation. The statement of affairs presented showed ranking liabilities of £18,802, including trade creditors for £9,542. The total claim of the bank was £3,494, but it held direct security of the value of £1,500 and a guarantee for a similar amount from Mr. C. Cook, to whom a charge was given on March 4th, 1924. A second bank was shown as a fully-secured creditor for £495, holding security deposited by Mr. S. H. Martin. The executors of Mr. J. Browne-Martin ranked as the cash creditors in the statement for £4,000, and interest of £156; they were also debenture holders for £2,175. The net assets were £1,318, leaving a deficiency of £17,484, so far as the creditors were concerned. The issued capital of the company consisted of 12,317 cumulative 8 per cent. participating preference shares of £1 each and 35,981 ordinary shares of 1s. each. All the issued shares were fully paid, and, as regarded the shareholders, there was a deficiency of £31,600. The company was formed in October, 1919, with a nominal capital of £100, which was immediately increased to £26,000. The company was formed to deal in motor cars, but later took up wireless. In 1922 Mr. Chapman joined the company, and conducted the wireless department; finally the whole concern was devoted to wireless. By December, 1924, the losses on the trading had increased to £10,530; in two years the company had lost approximately £7,000. About October, 1923, the directors approached the late Mr. Browne-Martin, who advanced £4,000 on the security of a debenture, of which about £2,000 had since been repaid. Since December, 1924, the company had suffered a series of reverses, but the directors had backed the concern by providing guarantees to the bank, and had used every endeavour to obtain money. Mr. P. Houstoun, of the British Traders' Association, remarked that last year a committee of the principal creditors was appointed, and it was then thought that further financial assistance would be forthcoming with a view to the business being continued. In answer to questions, the chairman stated that he had acted as the secretary of the company. In March, 1924, the company owed a substantial amount to various creditors. The largest creditors were then given bills of exchange, and all accounts were paid. The creditors were aware of the position. The representative of Standard Telephones & Cables, Ltd., the largest trade creditors, proposed a resolution that the voluntary liquidation of the company should be continued with Mr. Dilley as liquidator. This was carried, and a committee was appointed consisting of the representatives of Standard Telephones and Cables, Ltd., the Marconiphone Co., Ltd., and Metro-Vick Supplies, Ltd. The following are creditors:—

	£		£
Atkinson & Co., Ltd. ...	41	London Press Exchange, Ltd.	122
British Thomson-Houston Co., Ltd.	297	London Electric Wire Co. & Smiths, Ltd. ...	25

Igranic Electric Co., Ltd.	67		

Deansgate Electro Radio (Manchester), Ltd.—A petition for the winding up of this company has been presented to the County Court of Lancashire by Messrs. M. & A. Wolff, of 9-15, Whitecross Street, E.C., and will be heard in Manchester on March 30th.

Electrical Stores (Nottingham), Ltd.—Particulars of claims by April 16th to the liquidator, Mr. S. H. Hill, 1, St. Peter's Church Walk, Nottingham.

Carpax Co., Ltd.—Meeting of creditors, April 4th at the Onward Hall, Onward Buildings, 207, Deansgate, Manchester. Liquidator, Mr. J. Wilson, 2, St. James's Square, Manchester.

The National Register.

The accounts of the National Register of Electrical Installation Contractors for the past year show an increase of over £350 in the receipts, while the expenditure was slightly lower. The excess of income over expenses thus rose from £319 to £708. The balance sheet shows a satisfactory financial position. The report of the Executive Committee is to be presented at the annual meeting, which is to be held at the Institution of Electrical Engineers on March 28th (2.30 p.m.).

The Czecho-Slovakian Cable Industry.

In a recent article in the *Prager Tagblatt* Herr Emil Kolben, of the well-known Kolben Co., of Prague, stated that raw materials for the electric cable industry were subject to very heavy ship and railway freights and also heavy Customs duties, being almost all obtained outside Czecho-Slovakia. This cause, together with severe internal competition, had driven a number of small cable factories out of business and rendered necessary the creation of a Czecho-Slovakian Insulation Cable Central Sales Organisation, which had been formed under the title of "Isotuba." It was hoped that this organisation would enable the member firms to turn their attention to export business, which had so far been impossible.

New French Companies.

La Société Meridionale d'Energie Electrique is the name of a company which has lately been formed in Paris (4, Rue Sainte Anne) with a capital of 1¼ million francs, to establish electricity supply systems in the Midi and south-west districts of France.

Under the auspices of the French Thomson-Houston Co. a new concern has been formed in Paris with a small nominal capital and the title Société d'Usinage des Tubes pour l'Electricité.

Social Events.

The annual dinner of the Willesden Electricity Department was held at the Social Clubroom, Salusbury Road, on March 12th. The chief engineer (Mr. A. W. Blake) presided, supported by Councillor W. A. Hill (chairman) and other members of the Electricity Committee. An excellent musical programme provided by members of the staff followed the dinner. During the evening Mr. Blake presented a silver challenge cup to a team representing the sub-stations staff who had secured the highest number of points in a series of games competitions between the various departments.

On March 18th the annual dinner of the staff of Messrs. Watson & Sons (Electro-Medical), Ltd., was held at Pagani's Restaurant, W. After an excellent *menu* and the loyal toast Mr. C. H. Watson proposed the health of the chairman (Mr. M. J. Railing), and, in responding, Mr. Railing said that the company had come through the troubles of the past year in a highly satisfactory manner. He warned his audience, however, that the way was not yet clear and there was a need for hard work and a thorough understanding of his job by every individual. A concert followed, given by the "Harrovians," under the leadership of Mr. J. W. Haynes.

The annual staff dinner of Messrs. Ferranti, Ltd., was held on March 18th at the Midland Hotel, Manchester. The chair was occupied by Dr. S. Z. de Ferranti in the absence, through illness, of the chairman of the company, Mr. A. W. Tait. In a speech, Dr. Ferranti emphasised the need for reducing costs of production to enable British manufacturers to compete with the foreigner and so reap the full benefit of the increased demand for electrical products which was anticipated. Mr. Arthur Ellis, in proposing the toast of the company, referred to the large extensions nearing completion at Hollinwood and to Dr. Ferranti's keen interest in every department. He congratulated Dr. Ferranti on the honour about to be conferred on him. Mr. Vincent de Ferranti responded on behalf of the company. Mr. R. W. Cooper, a director of the company, proposed "Our Guests," on whose behalf Mr. W. Chamberlain responded. The toast, "The Chairman," was proposed by Sir B. Longbottom. Dancing and musical items followed.

For Sale.

Rotherham Corporation Electric Supply Department has for disposal 300 second-hand d.c. meters. The City of Bristol Health Department has for disposal a generating set, switchboard, storage battery, &c. Bedford Electricity Department invites offers for a 1,000-kW turbo-alternator set, with condenser, pumps, &c. Belfast Corporation Electricity Department invites offers for one Babcock & Wilcox water-tube boiler. Rushden and District Electric Supply Co., Ltd., has for disposal three surplus generating sets, &c. Wellingborough Electric Supply Co., Ltd., invites offers for surplus steam dynamos, Babcock boilers, chain grate boilers, condensers, &c. Shell-Mex, Ltd., has for disposal surplus generating plant now running at Shell Haven. Yorkshire (West Riding) Electric Tramways Co., Ltd., invites offers for two 320-h.p. Diesel engines, coupled to two Dick, Kerr generators, &c., booster, and travelling crane. (See our advertisement pages to-day.)

Book Notices.

To those concerned with railway electrification, a publication under the above heading, by Mr. R. H. Wright, of the Association of Engineering and Shipbuilding Draughtsmen (price 2s.), should prove of interest. It is a general consideration of the main problems involved in power distribution, transformation, and control for railway electrification. The progress made, both at home and abroad, to the present time is outlined, and the author speculates on the likely developments of the immediate future.

"The Anglo-American Year Book" (pp. 490). The American Chamber of Commerce in London. Price 15s. net.—The latest edition of this directory and guide retains the features which have made it so useful in previous years. Of particular interest is the section including the names, &c., of 7,000 companies engaged in Anglo-American trade.

"Radio for the Million." Vol. 1, No. 2. Pp. 48, illustrated. London: Mullard Wireless Service Co., Ltd. Price 1s.—This quarterly publication includes blue prints and diagrams and other useful information in article form. Copies are obtainable, free of charge, from the Editor, 63, Lincoln's Inn Fields, or by filling in a coupon obtainable from local dealers.

"The *Transactions* of the South African Institute of Electrical Engineers." Vol. XVIII, Part I. January, 1927. Price 2s.—In this issue are given the proceedings of the annual general meeting of the Institute, held at Johannesburg on January 27th this year. The valedictory address of the retiring president, Mr. V. Pickles, took the form of a review of the Rand Power Co.'s experiences from the year 1923 up to May, 1926, when the Witbank generating station was put in commission.

Standard Telephones & Cables, Ltd., has sent us a copy of a brochure produced for the occasion of the visit to the company's Hendon factory of the Prime Minister of New Zealand (Mr. J. G. Coates). This publication illustrates and describes the 5-kW broadcasting apparatus which the company has made for Wellington, N.Z.

"The *Journal* of the South African Institution of Engineers." Vol. XXV, No. 7, February, 1927. Price 2s.

"The North American Company" (pp. 58, ill.). New York: The Company.—This is a handsome brochure describing the growth of the company's subsidiaries since its incorporation in 1890. These companies serve about 900,000 consumers over large areas of the United States, and have a combined capital of about $70,000,000.

The Hart Accumulator Co., Ltd., has produced a "Nearest Garage Guide" for London. This contains the addresses, telephone numbers, &c., of theatres, music halls, hotels, restaurants, public places of interest, &c., in London, and by a system of references indicates the nearest garage and gives particulars of the facilities available thereat.

"Constructive Suggestions." Pp. 38; figs. 28. London: British Thomson-Houston Co., Ltd.—This booklet, No. A.G. 220, contains very full instructions for the home construction of "Resistor" 2, 3, 4, and 5-valve sets and amplifiers, utilising the new B.T.-H. resistance-capacity type B.8 valve. Complete detailed wiring diagrams, panel-drilling dimensions, and lists of components required, are included.

"*Journal* of the Institution of Electrical Engineers." Vol. LXV. March, 1927. London: The Institution. Price 10s. 6d.

"Technologic Papers of the U.S.A. Bureau of Standards." Vol. 21, No. 330. Resistance of conductors of various types and sizes as windings of single-layer coils at 150 to 6,000 kilocycles (5 cents).

"The *Journal* of the Royal Technical College, Glasgow," No. 3, contains articles recording the results of some of the research work carried out by the staff and senior students. Amongst these are some investigations in electrolysis and photoelectricity, combustion, and losses in nozzles. The journal contains 180 pages, and is admirably produced.

Prices of Raw Materials.

The following prices are only general, and they may vary according to quantities and other circumstances:—

	CHEMICALS, &c.		Price Mar. 22nd.	Fortnight's inc. or dec.
a	Acid, Oxalic	per lb.	5¾d.	...
a	Ammoniac, Sal	per ton.	£60	...
a	Ammonia, Muriate (large crystal)	,,	£52	...
a	Bisulphide of Carbon	,,	...	...
a	Borax	,,	£25	...
a	Copper Sulphate	,,	£25 10s.	...
a	Potash, Chlorate	per lb.	4d. to 4½d.	...

In their weekly report, dated March 19th, Messrs. James Forster & Co. stated:—"The lead market will probably continue to sag until a fresh wave of buying by consumers develops, when a sharp recovery from present values should be seen. The Board of Trade returns for February, 1927 (including manufactured lead) were:—Imports, 30,137 tons; exports, 1,660 tons; leaving for home absorption, 28,477 tons."

Lighting and Power Notes.

Bradford.—New Transformer Station.—The Electricity Committee is to provide a district transformer station in the Haworth Road district at a cost of £5,000.

Brighton.—Inquiry.—An inquiry was held at the Town Hall on March 15th and 16th by Col. T. C. Ekin into the application of the Peacehaven Electric Light and Power Co., Ltd., for a Special Order authorising it to supply electricity in the parish of Telscombe and part of the parish of Piddinghoe. The application was opposed by the Newhaven Rural District Council, the East Sussex County Council, and the Peacehaven Ratepayers' Association.

Bromley (Kent).—Transfer of Undertaking.—The Town Council has arranged to purchase the undertaking of the Bromley (Kent) Electric Light and Power Co., Ltd., for £135,000 under the terms of the option without resorting to arbitration. Pending the transfer, the Council has given its approval to extensions of mains at an estimated cost of £5,124.

Bury St. Edmunds.—New Plant.—The borough electrical engineer, Mr. S. E. Day, has submitted a recommendation to the Town Council to increase the plant at the electricity works at an estimated cost of £15,000. The matter has been referred to the Electricity Committee for consideration.

Canada.—Ontario.—A report has been issued by the Ontario Department of Mines giving details of hydro-electric development for the supply of power to the metallic mines of Northern Ontario. The first installation was made in 1905, and the development during the past 20 years has been at the average rate 6,636 h.p. a year. The Northern Canada Power Company has at present a surplus of about 10,000 h.p., but this will shortly be absorbed by extensive mining operations in the Rouyn mining district of Quebec. The twelve power systems of Northern Ontario have an aggregate capacity of 131,170 h.p. The total amount of power now used in mining is 83,000 h.p., of which the gold mines take 46,350 h.p., nickel and copper mines 28,850 h.p., and silver mines 7,800 h.p.

Cleethorpes.—Electricity Supply.—At a recent meeting of the Urban District Council it was reported that the Electricity Commissioners were prepared to sanction the raising of a loan for buildings, cables, &c., in connection with the electricity scheme for the district as soon as the agreement between the Council and Grimsby Corporation had been approved by them.

Continental.—Germany.—The Association of Electricity Works of Berlin has issued a statement showing that the output of the 388 generating stations in Germany in 1925 was 12,000,000,000 kWh, of which 61 per cent. was produced by the 24 largest works, each of which is responsible for over 100 million kWh per annum.

The Waggon und Maschinenbau Gesellschaft, of Corlitz, has recently completed a 22,000/27,000-kW turbine running at 3,000 r.p.m. at a vacuum of 96 per cent. A feature of the machine is the division of the low-pressure portion into four separate compartments within a single casing. The company is at present constructing a high-speed turbine of a capacity of from 30,000 to 33,000 kW with a 95 per cent. vacuum at the exhaust steam outlet.

Italy.—Work has commenced on the construction of a large new hydro-electric station at Cardano, which, it is claimed, will be the largest of its kind in Europe. The plant, which will have an annual output of 500 million kWh, will utilise the water of the River Isarco, which will be conveyed to the station by means of a tunnel 10 miles in length, the available head being about 570 ft. Five sets of 50,000-h.p. turbo-generators are to be installed for the supply of power to the provinces of Lombardy, Veneto and Piemonte, and three sets each of 10,000 h.p. to furnish the power for the electrification of the Bolzano-Brenner railway.

Switzerland.—The municipal central electricity station at Lugano is to be extended by the addition of a new 3,000-h.p. Diesel engine in order to meet the increasing demand for electricity in the district. The contract for the new engine has been placed with Gebruder Sulzer, of Winterthur, who constructed the existing 2,300-h.p. engine at the Lugano station.

Glasgow.—Progress during February.—The Corporation electricity manager states that under the Department's scheme 116 houses were wired in February, making the total to date 3,352. Agreements under the 10 years' hire-purchase scheme numbered 72. The number of applications for the hire of appliances was 296, making the total to date 14,575.

Gravesend.—Proposed Change-over.—The Corporation has applied for consent to change over its system of electricity supply from d.c., 3-wire, 460 and 230 V, to a.c., 3-phase, 50 cycles, 4-wire, 400 and 230 V.

Grimsby.—Extension of Supply.—The borough electrical engineer (Col. W. A. Vignoles) has submitted a report to the Electricity Committee on the provision of an electricity supply to the Cleethornes Council. He recommends the laying of a cable from Ribly Street sub-station to Park Street, and one from the power station to Car Lane. These would be joined by two similar cables to be laid by the Cleethorpes Council in its area. A sub-station at Old Clee is also proposed, the estimated cost of the whole scheme being £10,200.

Hawarden.—Electricity Extensions.—The Rural District Council has under consideration a scheme for extending its area of electricity supply so as to include Ewloe, Aston Broughton, Bretton, Penyffordd, and Sealand, at an estimated cost of £28,675, and application is to be made for sanction to a loan for this purpose.

Hull.—Electricity Supply.—The Corporation has received inquiries from Withernsea and Hornsea regarding an electricity supply for these areas, and has replied suggesting that the authorities should communicate with the Central Electricity Board, asking if it would be prepared to sanction the necessary transmission line.

India.—Salsette (Bombay).—The electrification of Salsette, which was first proposed in 1916, has now been approved by the Government of Bombay. According to *Indian Engineering* arrangements have been completed with the Andhra Valley Power Supply Co., Ltd., to purchase electricity in bulk at Dharavi receiving station, whence it will be conveyed by a h.p. underground cable to Bandra for distribution and thence to Santa Cruz *via* Khar in the first instance. The area of supply granted under the licence includes, in addition to the above centres, the townships of Ville Parle, Juhu, Varsova, Andheri, the Military Cantonment of Wakola, Kurla, Ghatkopar, Vikhroli, and the whole of the island of Trombay. Energy will probably be available at Bandra, Khar and as far north as Santa Cruz before the conclusion of the current year. The work of construction is to begin before next monsoon.

Japan.—Electrical Development.—Work on the construction of a steam power station at Tsurumi by the Tokyo Electric Light Co. will commence shortly. The station will have a capacity of 70,000 kW, and the cost is estimated at 15,000,000 yen.

The Imperial Government Railways are erecting a power station at Shinano-gawa, at a total estimated cost of 79,210,000 yen, of which 62,600,000 yen will be for the station building and plant, 11,100,000 yen for transmission line, and 5,400,000 yen for sub-station building and plant. The first section of the scheme is to be completed in 1932, and the second section in 1935.

Llanfairfechan.—Electricity Scheme.—The Urban District Council has adopted an electricity scheme prepared by Mr. Price F. White, of Bangor. It is proposed that a bulk supply of electricity shall be obtained from the North Wales Power Co. The total cost of the scheme is estimated at £11,700.

London.—Shoreditch.—The Electricity Committee has decided to extend mains at a cost of £9,534, to lay services to consumers' premises at a cost of £3,600, and purchase prepayment meters at a cost of £4,600.

Islington.—The Electricity Committee has received sanction to the borrowing of £22,000 for mains, services, transformers, and meters.

Lowestoft.—Loans.—The Electricity Committee has recommended to the Town Council that application be made for sanction to loans totalling £20,800 made up as follows:—Mains, £3,000; meters, £2,000; services, £5,000; feeder cables, £10,800.

Middlesbrough.—Electricity Scheme Rejected.—The Electricity Commissioners have rejected the Corporation's application for sanction to erect a power station instead of purchasing a supply from a power company. The Corporation asked for sanction to borrow £141,346. According to the *Manchester Guardian*, the Commissioners state that they are not satisfied that the Corporation would be in the position to give a supply of electricity adequate in quantity and regularity to meet the present and prospective demands of its consumers at a cost not greater than that at which it could give a supply if it obtained a supply of electricity from the Cleveland and Durham County Electric Power Co., and express the opinion that the price of the bulk supply should be fixed at £2 7s. per kW per annum, and 0.3d. per kWh, on conditions set out in a letter, for a reasonable term of years with provision for quinquennial revision, and ask the Corporation to endeavour to agree with the Power Company the appropriate terms and conditions under which the arrangement is to be made. If the parties are unable to agree upon the terms they will fall to be settled by the Commissioners.

Northern Ireland.—Warrenpoint (Co. Down).—The Urban District Council is inviting tenders for the electric lighting of the town.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Hastings.—The increase of 12½ per cent., made owing to the coal strike, has been removed.

Isle of Wight.—*Isle of Wight Electric Light and Power Co., Ltd.*—The temporary increase of ½d. per kWh is withdrawn.

Slaithwaite.—Loan Sanctioned.—The Urban District Council has received sanction to the borrowing of £6,250 for mains and services, and £1,000 for meters.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the following authorities:—The Bourton-on-the-Water Electric Light and Power Co., Ltd., authorising it to supply electricity in the

parish of Bourton; the Leicestershire and Warwickshire Electric Power Co., for the supply of electricity in the rural district of Castle Donington, and parts of the rural districts of Ashby-de-la-Zouch, Loughborough, and Shardlow; the King's Lynn Corporation, to extend its area of electricity supply so as to include certain parishes in the rural districts of Freebridge Lynn and King's Lynn; and the Northampton Electric Light and Power Co., Ltd., to supply in the boroughs of Brackley and Buckingham, the rural districts of Crick, Middleton, Cheney, Brackley, Buckingham, and Winslow, and certain parishes in the rural districts of Daventry, Brixworth, Oxenden, Towcester, and Ampthill.

Tarvin.—Electricity Supply.—The Electricity Commissioners have decided to grant the application of the Chester Corporation to supply electricity in the district and not to proceed further with the application by the Gwynedd Trust.

United States.—Electrical Development.—A large hydro-electric scheme on the Saluda River, ten miles west of Columbia, South Carolina, has been undertaken by the General Gas & Electric Corporation, involving an initial expenditure of $20,000,000. The annual output of the plant is expected to exceed 300,000,000 kWh.—*Reuter's Trade Service* (New York).

According to the *Electrical World*, the Standard Gas & Electric Co. is to carry out developments during 1927 at a cost of $61,500,000. The programme includes the extension of the Colfax steam generating station from 190,000 kW to 270,000 kW, and the erection of a hydro-electric power station on the Rouge River, which will have an initial capacity of 15,000 kW and an ultimate capacity of 45,000 kW. This station is expected to be in operation by October next.

The West Virginia Power & Transmission Co. has applied for a licence for the erection of a power station on the Cheat River and tributaries in West Virginia and Pennsylvania. A number of dams are to be constructed, and the scheme provides for the development of 238,000 h.p.

Wellington (Somerset).—Electricity Supply.—The Rural District Council has decided to give its consent to an application by Dr. J. A. Purves, on behalf of the Dulverton Electric Light Co., Ltd., for a Special Order to supply electricity within the Council's area. The supply will be by means of overhead cables.

West Cornwall.—Electricity Scheme.—Plans prepared by the West Cornwall Electric Supply Co., in connection with works in areas for which it is applying for a Special Order were laid before the West Penwith Rural District Council at Penzance on March 10th. It was intimated that the maximum charge which the company proposed to make was 1s. per kWh for a specified minimum number of units. Some objection was raised to the powers proposed to be conferred under the Order for the erection of overhead cables, and it was mentioned that Hayle Urban District Council had also objected to the use of overhead cables on the ground of their unsightliness. The whole matter was referred to a committee.

Whitby.—Correction.—We are informed that reductions in the electricity charges announced in our last issue are incorrect, the following scale is now in operation:—Lighting: 7d. per kWh. Heating and domestic rate: 1½d. per kWh. Power: First 500 kWh, 3d. per kWh; remainder, 2d. per kWh.

York.—Loan Sanctioned.—The Electricity Committee has received sanction to the borrowing of £3,000 for the purchase of transformers.

Tramway and Railway Notes.

Bradford.—Fares.—Following the rejection by the Tramways Committee of a scheme to raise 1½d. tramway fares to 2d. and to reduce long-distance fares to a maximum of 3d., the Committee has now introduced for consideration by the City Council another scheme, involving the increase of the 1d. fares to 1½d., 1½d. fares to 2d., the maximum fare to be reduced to 2d., with the issue of weekly passes at 2s. and 2s. 6d. The city treasurer states that, based on the number of passengers carried last year, the proposed revision would yield a net increase of £10,000 in receipts. At a subsequent meeting of the Corporation a compromise was agreed upon. The penny stages are retained (though some may be shortened), the 1½d. fares will be increased to 2d., and 2d. will be the maximum fare. The longest route is 6½ miles, the present fare for which is 6d. Weekly passes will also be issued.

Burnley.—Transport Finance.—At a meeting of the Town Council on March 16th, the chairman of the Finance Committee expressed dissatisfaction with the position of the transport services. They showed a loss on certain routes, which was serious, and must have a crippling effect. Instead of the surplus on the Tramways and Omnibuses Department for the current year being £18,553, it would only reach £12,027. While giving every latitude to omnibuses as a new venture, the Committee would, if the loss continued, have to consider cutting down services.

Continental.—Germany.—The Ruhr Settlement Union has allocated a sum of 2,000 marks for the formation of an investigation company for the construction of high-speed railways. The question concerns a type of railway somewhat similar to the Langen suspended system which is in use at Elberfeld, although the speed is put at a possible rate of 150 m.p.h.

Dearne Valley.—Tramcars *v.* 'Buses.—According to the *Electric Railway and Tramway Journal*, notices were recently exhibited announcing a fresh scale of fares on the Dearne District Light Railway. Drastic reductions have been made. The fare from Barnsley to Thurnscoe has been reduced from 10d. to 3d. Similar concessions have been made throughout the system, and passengers will be able to travel the whole length of the route, which is about 10 miles, for 3d. The fare from Wombwell to Barnsley has been reduced from 5d. to 2d. The immediate result was the swamping of the cars by passengers anxious to avail themselves of the cheap rate of travel, but the initial enthusiasm of the people for the tramways has now been countered by the Barnsley and District Traction Co., Ltd., reducing its 'bus fares to similar figures.

Gravesend.—Inquiry.—An inquiry was held by the Ministry of Transport on March 15th into the application of the Gravesend and Northfleet Electric Tramways, Ltd., for an Order authorising it to abandon its tramway and to substitute omnibuses or other passenger-carrying vehicles. For the company it was stated that 'bus competition had materially affected receipts, and in 1926 the company's income was £20,000, against which working expenditure of £20,332 had to be met. The tramway track was worn, and the cost of reconstruction was estimated at £165,000, a figure which the company was unable to face. It was not proposed to remove the track, but that at the end of a certain period the material should vest in the Road Authority. The value of the track would compensate the local authority for taking up the lines. For the Northfleet Council it was proposed that after notice of abandonment had been given by the company, it should pay to the Road Authority such sum as might be agreed to cover the cost of taking up the track and reconstructing the road. In any case the company should remove the poles and wires. The Town Clerk said that the Gravesend Corporation was of the same opinion as Northfleet, and he also suggested that the Corporation should be compensated for loss of profit in respect of its electricity undertaking, which supplied power for the tramway undertaking. The Ministry will give its decision in due course.

Irish Free State.—Dublin.—The Dublin United Tramways Co. is taking over the disused Dublin-Lucan tramway line, and is to reconstruct it at an approximate cost of £80,000. The track will be laid above the road surface. The company will also provide an electricity supply for the whole district from Dublin to Lucan.

Japan.—Underground Railway.—It is reported that Messrs. N. Kaneko and G. Takikawa propose to form the Kobe Underground Railway Co., Ltd., with a capital of 20,000,000 yen, for the construction of an underground railway from Sumiyoshi to Suma and from Wakinohama to Suma, both lines passing through Kobe, the total length being 18 miles. The estimated cost of the scheme is 60,000,000 yen.

Railway Electrification.—The Matsuzaka railway between Matsuzaka-machi and Oishi-mura, Miye-ken, a distance of 12 miles, is being electrified at a cost of 300,000 yen.

New Tramway.—An application for permission to construct an electric tramway between Koriyama and Yumoto-machi, Fukushima-ken, has received official sanction. The line will be 23 miles in length, and the cost is estimated at 2,145,500 yen.

Worcester.—Purchase of Tramways.—The City Council has adopted a recommendation of the Traffic Committee to purchase the privately-owned tramways in the city at a cost of £75,000. It is proposed to remove the tramway track and enter into an agreement with the Midland Red Omnibus Co for a 'bus service in the district.

Telegraph and Telephone Notes.

Canada.—Edmonton Automatic Telephone Exchange.—A new automatic telephone exchange has recently been brought into use at Edmonton, Canada, to serve the south district. It was manufactured and installed by Siemens Bros. & Co., Ltd., Woolwich, and is the No. 16 system with an initial equipment of 2,300 lines and ultimate capacity for 5,500. It supersedes an old 3-wire system with push-button ringing, and is the first portion of the scheme in hand to provide Edmonton with a modern fully-automatic system of 100,000 lines.

Hungary.—Long-distance Telephone Communication.—The laying of a direct telephone cable joining Budapest with Vienna, Frankfort, Munich, and other German towns is

nearly finished. The development of the Hungarian telephone system is making great progress, and in about three years all towns and many villages in Hungary will be connected by telephone.—*Reuter's Trade Service* (Budapest).

Japan.—Storm Damage.—The recent earthquake damage is officially regarded as surprisingly low. A snowstorm interrupted communication throughout the country on March 13th and 14th and put out of commission in Tokyo alone 13,000 telephones, and a public outcry will probably result, says the *Financial Times*, as there is complaint of the inadequacy and inefficiency of the system. The Bonin cable was also broken, and cable communication between London and places in Japan beyond Nagasaki was interrupted recently. Both the Great Northern Telegraph Co.'s and the Great Eastern Telegraph Co., Ltd., services were affected.

Long-distance Radio Communication.—New Zealand-South Africa.—Soon after dawn on March 18th New Zealand and South Africa were in direct communication for the first time, when a speaker at the Shag Valley station conversed by Morse signals for over an hour with an operator at Caledon, in the Orange Free State Province. Communication was fairly easy, although little power was used at the New Zealand end. New Zealand amateurs have been trying for years to get into touch with South Africa, but hitherto without success.—*Reuter* (Wellington).

Pacific Cable Board.—Reconstitution.—A Bill introduced in the House of Commons provides that the Pacific Cable Board is in future to consist of seven members—two representatives of the United Kingdom, two of Canada, two of Australia, and one of New Zealand, with a chairman appointed by the Board and agreed on by the Governments, who may or may not be one of the members. The chairman is to receive a salary of £1,000 a year, plus travelling expenses (or more, if the Governments so agree) unless he holds an office of profit under the Crown, and every other member of the Board not holding such office of profit will be paid £300 a year. The Bill consolidates the Pacific Cable Acts of 1901 and 1924, and provides for the disposal of receipts and surpluses and for the application of the reserve fund. It empowers the Board, subject to the approval of the partner Governments, to undertake as agent for and at the expense of the Governments of any parts of his Majesty's Dominions any work in connection with telegraph communication, whether by means of cables or wireless telegraphy, within the sphere of its operations or within the Caribbean area.

Siam.—New Radio Station.—The German Telefunken Co. has obtained the contract for the new wireless station at Bangkok. The three stations which have existed for a number of years have not been capable of transmitting messages effectively to Europe, and it was decided to have a station for short-wave, duplex, high-speed working between Siam and Europe. Tenders were obtained from the leading companies: the Marconi Company quoted £66,153 for the "beam" system and £29,163 for a system of omni-directional communication; the prices, however, were not inclusive. The Compagnie Générale de T.S.F. wanted 213,785 gold dollars, plus 20,000 ticals, plus Customs duty and landing charges; the Telefunken Co. quoted £25,000, which included everything, and secured the contract.—*Reuter* (Bangkok).

Spain.—Madrid-Argentina Wireless Service.—In the course of a Cabinet Council on March 16th a Bill was considered authorising a private company to install a short-wave wireless station to connect Madrid directly with the Argentine. Three conditions, however, are attached to the authorisation: (1) That the service must not be exclusively between these two countries; (2) the company must not have a monopoly; and (3) it must not receive State aid. The Bill will now be handed to the Minister of the Interior for examination by technical experts.—*Reuter* (Madrid).

The Telephone Service.—New Anglo-French Cable.—The rapid development of long-distance telephony has necessitated the provision of new routes of communication, and facilities for trans-continental telephone traffic were increased by the laying on March 16th of a new cable in the English Channel. It is of the paper-insulated lead-covered type, and has the advantage of low electrostatic capacity and leakance, which are characteristics very favourable for efficient speech transmission. The cable is 23½ nautical miles in length, is about 2.6 in. in overall diameter, and weighs 623 tons; it was laid in one length (obviating the necessity of making a joint at sea) between Sandgate, on the English side, and Audresselles, on the French coast. This is the third cable of its kind to be laid by Messrs. Siemens Bros. & Co., Ltd., the previous ones carried out by the company being the Anglo-Dutch cable of 1924, and the Anglo-Belgian cable laid last year.

Year's Progress.—Post Office statistics show that during 1926 119,092 new telephones were installed in Great Britain and Northern Ireland, bringing the total number in use up to 1,477,000. Of the new installations, 41,596 were in private residences, bringing this total to 291,700; the share of the provincial exchanges in this number was 181,530. There were 21,493 call boxes in use at the end of the year; street kiosks with telephones numbered 2,716; of the total number of call boxes, the provinces had 16,807 and London 4,686. The number of new rural exchanges opened was 196, bringing the total to 991. Party-line stations in rural areas numbered 9,958, the year's increase being 204; rural railway stations "on the 'phone" numbered 721, of which 47 were added during the year. During 1926 there were 73,00,000 more calls than in 1925, the grand total of calls for 1926 having been 1,072 million.

West Indian Islands.—Telegraphy.—The report of the Pacific Cable Board for the year ended March 31st, 1926, on the working of the submarine cables and wireless telegraph stations in the West Indian Islands and British Guiana shows that the excess of receipts over expenditure was £6,010, the latter amounting to £39,173. A sum of £21,309 was paid to the National Debt Commissioners during the year in respect of interest on, and repayment of, advances by way of capital for laying and equipping the system; £6,010 (surplus receipts) was available towards meeting this annuity, and the deficiency to be made good by the contributing Governments will therefore be £15,299 for the year under review. Prior to the establishment of the Government system, a subsidy amounting to £26,300 was paid annually to the West India and Panama Telegraph Co., which lapsed in September, 1924, and it is gratifying to the Board that the operations for the first complete year have resulted, even after the payment for amortisation of capital, in the deficiency falling short by £11,000 of the subsidy previously paid. During the year under review no interruptions occurred to the cables and none of the wireless stations was out of commission. The local organisation work was carried out by Mr. W. E. Rockingham (one of the Board's superintendents attached to the Pacific cable system), assisted by Mr. R. G. McLachlan and four other officers who were transferred to the West Indies temporarily, but Mr. R. G. McLachlan has since been permanently appointed to the West Indian system; the work presented many real difficulties. The news service, which is supplied free to the West Indies by the Board, has been improved, and there has been a substantial growth in the traffic since the Board's service commenced.

Radio Notes.

Australia.—New Station.—3DB Broadcasting Co. Pty., Ltd., has been registered at Melbourne, with a capital of £20,000 in £1 shares, for the purpose of opening a "B"-class broadcasting station, to operate from Capitol House, Melbourne, and Amalgamated Wireless (Australasia), Ltd., is equipping a transmitting room on the roof. Two lattice steel towers, 45 ft. high, will be erected on the roof to carry the aerials. The initial power output will be 500 watts and the wave-length 255 metres. Revenue will be derived from advertising, no fees from listeners being allotted to "B"-class stations.

Austria.—Visitors' Fees.—Foreign visitors to Austria whose stay does not exceed three months, and who have with them receiving sets, are not required to pay the usual licence fee of 2s. per month, but a special fee of only 1s. per month. An application form can be secured at any post office, and, on entry into the country, foreigners must deposit a given sum for customs purposes to cover the set, which is reimbursed on leaving the country.

Holland.—Short-Wave Telephony.—Twice within the past few days has telephone communication been established between Holland and the Dutch East Indies. This achievement, it is claimed, constitutes a world's record for long-distance wireless telephony. A musical concert given in Eindhoven was clearly heard by a Bandoeng wireless amateur, and a telegram was received from Dr. de Groot, the head of the Dutch East Indian telephone and telegraph service, declaring that reception on the 30.92-metre wave was excellent, two speeches having been quite distinctly heard at the Government wireless receiving station in Java. As there is at present no wireless telephone transmitting apparatus in Java, the acknowledgments were by ordinary cable, or wireless-telegraphy. The transmitting installation was constructed by Dr. Balthasar van der Pol, the head of the wireless investigation department of Messrs. Philips, of Eindhoven, and Mr. Numans, and was designed for experimental purposes, the Philips' Company having been granted a special licence for this object. The regulation of the frequency is by a vibrating quartz crystal; a valve amplifier and water-cooled Philips transmitting valves are used, and the antenna consists of a single wire attached to a pole only 22 ft. from the ground. An attempt is shortly to be made to secure similar contact with the West Indies.—*Reuter* (Amsterdam).

Sweden.—New High-Power Station.—The new station in Motala, in the centre of Sweden, is expected to begin test transmission towards the end of March, having a power of not less than 30 kW; it is of the same type as Daventry, says *World Radio*, and when opened the Karlsborg station will revert to its real purpose as a wireless-telegraph station, its broadcasting wave (1,305 metres) being taken over by Motala.

Licences.—The number of licence-holders has increased to about 260,000, thus placing Sweden next to England with regard to the percentage of licensees to the population.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the Electrical Review containing the advertisement is given in parentheses below.

Contracts Open.

Australia.—Melbourne.—May 10th. Postmaster-General's Department. Telephone relays. (B.X. 3333.)*

May 17. Resistances and reactances. (B.X. 3307.)*

May 23rd. State Electricity Commission. Switchgear and accessories. (B.X. 3285.)*

May 9th. 6,600-V transformers and spares. (B.X. 3331.)*

Sydney.—May 9th. Electricity Department. Station auxiliary switchgear. (B.X. 3338.)*

Beckenham.—April 4th. Electricity Department. Three e.h.p. transformer sub-station switchboards. (March 18th.)

Bristol.—April 11th. Electricity Department. 39 miles (approx.) 3-core, paper-insulated cable. (March 18th.)

Colombia. — Bogota. — April 30th. Ministry of Public Works. Two electric lifts. (A.X. 4433.)*

Edinburgh.—April 18th. Electricity Supply Department. De-aerating plant and boiler feed pumps. (See this issue.)

Grimsby.—April 2nd. Electricity Department. Deansgate balancer set, switchgear and cablework. (See this issue.)

India.—April 5th. India Store Department. 27,000 yd. paper-insulated armoured cable for telephones. (See this issue.)

Kilmarnock.—April 6th. Ayrshire Electricity Board. Two water-tube boilers, with superheaters, economisers, air heaters, mechanical stokers, and coal-handling plant. (March 18th.)

Liverpool.—March 31st. City Engineer's Department. Tramway rails and fishplates, fish bolts, tie bars, and copper bonds. City Engineer, Municipal Buildings, Dale Street.

London.—Holborn.—April 13th. Board of Guardians. Electric lighting installation at the London Road, Mitcham, schools. (March 18th.)

London County Council.—March 29th. Electric lighting installation for Sudbourne Road elementary school, Brixton, S.W. (approx. 136 points). (March 18th.)

Middlesbrough.—April 8th. Electricity Department. 12 months' supply of cables and meters. (See this issue.)

New Zealand. — Wellington.—May 31st. Public Works Department. 50-kVA transformers for the Waikaremoana electric power scheme. (B.X. 3294.)* 50-kVA transformer for Arapuni scheme. (B.X. 3293.)*

June 7th. Railway sub-station equipment, Lake Coleridge electric power scheme. (B.X. 3295.)*

May 4th. General Post Office, Stores Division. Sub-station protectors. (B.X. 3286.)*

June 13th. New Zealand Railways. Machine tools, workshop equipment and overhead electric travelling cranes. (A.X. 4344.)*

June 6th. Six electric locomotives. (A.X. 4355.)* Overhead equipment for the Christchurch-Lyttelton electrification scheme. (B.X. 3301.)*

Plympton St. Mary.—March 31st. Urban District Council. H.p. cables, underground and overhead mains, h.p. and l.p. switchgear, transformers and transformer kiosks. (March 11th.)

Rumania.—Bukarest.—April 2nd. 600,000 porcelain insulators. (B.X. 3314.)*

Southend-on-Sea.—April 9th. Light Railways and Electricity Department. Remote-controlled rotary convertors. (March 11th.) April 19th. 4,000 joint boxes. (See this issue.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Burton-on-Trent.—Electricity Committee. Accepted:—
Switchgear (£189), transformer (£237).—English Electric Co., Ltd.

Cranbrook.—Board of Guardians. Accepted:—
Installing electric lighting at the Institution (£144).—Strange & Sons.

Dewsbury.—Town Council. Accepted:—
Installing electric light at 54 houses on the Ravens Lodge site (£344) and wiring 64 houses on the Thornhill site (£432).—W. Angus.

Glasgow.—Electricity Committee. Recommended:—
Six 1,500-kVA transformers (£6,300).—Metropolitan-Vickers Electrical Co., Ltd. Nine 1,500-kVA transformers (£9,450).—British Electric Transformer Co., Ltd.
Sixteen 400-kVA transformers (£5,691).—Four each from Johnson & Phillips, Ltd., British Electric Transformer Co., Ltd., Ferranti, Ltd., and Metropolitan-Vickers Electrical Co., Ltd.
Four 200-kVA transformers (£890).—British Electric Transformer Co., Ltd.; two ditto (£445).—Metropolitan-Vickers Electrical Co., Ltd.

Tramways Committee. Recommended:—
Cab-tire sheathed cable.—Macintosh Cable Co., Ltd.
Trolley wire.—Thos. Bolton & Sons, Ltd.; and R. Johnson & Nephew, Ltd.
Battery for battery truck.—Hendry Bros.

Government Contracts.—The following contracts were placed by various Government Departments during February, 1927:—

Admiralty Contract and Purchase Department.
Motor alternators.—Newton Bros. (Derby), Ltd.; Mackie and Co., Ltd.
Oil-driven alternators.—W. H. Allen, Sons & Co., Ltd.
Aluminium ingots.—British Aluminium Co., Ltd.
Repairs to armature.—English Electric Co., Ltd.
Batteries and spare parts.—Chloride Electrical Storage Co., Ltd.
Battery spares.—D.P. Battery Co., Ltd.
Electric bells, &c.—Walters Electrical Mfg. Co., Ltd.; W. McGeoch & Co., Ltd.; A. Graham & Co., Ltd.; Engineering and Lighting Co., Ltd.; Bonella Bros.
Electric cables.—Enfield Cable Works, Ltd.; General Electric Co., Ltd.; Anchor Cable Co., Ltd.; Edison Swan Cables, Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Hooper's Telegraph & I.R. Works, Ltd.; Johnson & Phillips, Ltd.; Macintosh Cable Co., Ltd.; Siemens Bros. & Co., Ltd.; St. Helens Cable and Rubber Co., Ltd.; Greenwich Cable Works, Ltd.; Standard Telephones & Cables, Ltd.
Clips for electric cables.—Freckleton & Co.; Hawkers, Ltd.; R. & F. Keates; E. Showell & Sons, Ltd.
H.p. air compressor.—P. Brotherhood, Ltd.
Electric overhead travelling crane.—Herbert Morris, Ltd.
Electric table fans.—General Electric Co., Ltd.
Motor-generators.—Newton Bros. (Derby), Ltd.
Feed-water heaters.—G. & J. Weir, Ltd.
Electric light installations.—G. E. Taylor & Co.; Johnson and Phillips, Ltd.
Lampholders.—W. McGeoch & Co., Ltd.; General Electric Co., Ltd.; Rainsford & Lynes; Edison Swan Electric Co., Ltd.
Projector lamps and parts.—Sperry Gyroscope Co., Ltd.
Lanterns, &c.—W. McGeoch & Co., Ltd.; London Electric Firm; Engineering and Lighting Equipment Co., Ltd.; Hawkers, Ltd.
Note magnifiers and tuners.—Radio Instruments, Ltd.
Stoneware troughing and tiles.—Doulton & Co., Ltd.
Switches, &c.—W. McGeoch & Co.; Bertram Thomas; Edison Swan Electric Co., Ltd.; Player & Mitchell; Edwards Bros., Ltd.; Gabriel & Co.; Park Royal Engineering Co., Ltd.; Hawkers, Ltd.; D. H. Bonnella & Son; Tok Switches, Ltd.
Telephone receivers.—S. G. Brown, Ltd.
Aerial wire.—Connollys (Blackley), Ltd.
Copper wire.—W. T. Henley's Telegraph Works Co., Ltd.; St. Helens Cable & Rubber Co., Ltd.; Ward & Goldstone, Ltd.; General Electric Co., Ltd.

War Office.

Air compressor.—Broom & Wade, Ltd.
90 c/m searchlight lamps.—Park Royal Engineering Co., Ltd.

Air Ministry.

Accumulators.—Peto & Radford, Ltd.
Direction-finding receiver.—Marconi's Wireless Telegraph Co., Ltd.
Generators.—W. Mackie & Co., Ltd.; Newton Bros. (Derby), Ltd.
Magnetos and spares.—British Thomson-Houston Co., Ltd.
Receivers.—H. W. Sullivan, Ltd.
Valves.—General Electric Co., Ltd.

Post Office.

Telegraph apparatus.—Creed & Co., Ltd.
Telephone apparatus.—Phœnix Telephone & Electric Works, Ltd.; Siemens Bros. & Co., Ltd.; Standard Telephones & Cables, Ltd.; Sterling Telephone and Electric Co., Ltd.
Testing and protective apparatus.—Evershed & Vignoles, Ltd.; Phœnix Telephone & Electric Works, Ltd.; Power Equipment Co., Ltd.
Battery stores.—C. A. Vandervell & Co., Ltd.
Cable (various).—British Insulated Cables, Ltd.; Callender's Cable & Construction Co., Ltd.; Connollys (Blackley), Ltd.; Enfield Cable Works, Ltd.; W. T. Glover & Co., Ltd.; Hackbridge Cable Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Johnson and Phillips, Ltd.; Macintosh Cable Co., Ltd.; Pirelli-General Cable Works, Ltd.; Standard Telephones & Cables, Ltd.; Union Cable Co., Ltd.
Dry cells.—Siemens Bros. & Co., Ltd.
Loading coils.—General Electric Co., Ltd.; Siemens Bros. and Co., Ltd.
Cords for telephones.—British Insulated Cables, Ltd.; Phœnix Telephone & Electric Works, Ltd.; Siemens Bros. & Co., Ltd.; Standard Telephones & Cables, Ltd.
Wallboards.—Venesta, Ltd.
Bronze wire.—T. Bolton & Sons, Ltd.; Elliotts Metal Co., Ltd.; Richard Johnson & Nephew, Ltd.; Shropshire Iron Co., Ltd.; F. Smith & Co. (incorporated in the London Electric Wire Co. & Smiths, Ltd.).
Electric lighting installation at Langham new telephone exchange.—Electric Power Installation Co., Ltd.
Telephone exchange equipment.—Carpet Manufacturing Co., Ltd. (Kidderminster); Borough of Hove Town Council; Newcastle-on-Tyne Corporation; Middlesbrough Co-operative Society, Ltd.: Relay Automatic Telephone Co., Ltd. Midland Bank, Ltd. (Poultry, E.C.): General Electric Co., Ltd. Sub-contractors: W. Jones & Co. for ringing machines. Kensington: General Electric Co., Ltd. Sub-contractors: Newton Bros. (Derby), Ltd., for charging machines; Crompton and Co. for ringing machines; D.P. Battery Co., Ltd., for batteries. Epsom: Automatic Telephone Manufacturing Co., Ltd. Beckenham (Kent): Siemens Bros. and Co., Ltd. Sub-contractors: English Electric Co., Ltd., for charging machines; Crompton & Co. for ringing machines; Hart Accumulator Co., Ltd., for batteries. Fleet (Hants.) and East Grinstead: Siemens Bros. & Co., Ltd. Riverside (Hammersmith), Finchley, East, and Clissold: Standard Telephones & Cables, Ltd.
Telephone repeater-station power plant.—Halesworth, Suffolk: Newton Bros. (Derby), Ltd. Sub-contractors: Hart Accumulator Co., Ltd., for batteries; Ruston & Hornsby, Ltd., for engines. Taunton: Newton Bros. (Derby), Ltd. Sub-contractors: Premier Accumulator Co. (1921), Ltd., for batteries; Ruston and Hornsby, Ltd., for engines.

Crown Agents for the Colonies.

Cable.—Shropshire Iron Co., Ltd.
Carbons.—Kolok Mfg. Co., Ltd.
Casing and tubing.—British Mannesman Tube Co., Ltd.
Fuse.—Bickford, Smith & Co., Ltd.
Telephone and telegraph materials.—Siemens Bros. & Co., Ltd.; Ericsson Telephones, Ltd.; Standard Telephones and Cables, Ltd.
Train lighting materials.—J. Stone & Co., Ltd.
Turbine spares.—Brush Electrical Engineering Co., Ltd.
Wireless apparatus.—Marconi's Wireless Telegraph Co., Ltd.

Hamilton.—Town Council. Accepted:—
Electric lighting installation at Udston Hospital extensions (£183).—W. Y. McAdam.

London.—Hammersmith.—Electricity Committee. Recommended:—
500 yd. h.p. cable (£194).—Standard Telephones & Cables, Ltd.
Work in connection with the construction of the 36-in. and 40-in. discharge pipes (£3,014).—T. Muirhead and Co., Ltd.

Admiralty.—
Resistance rods.—Edison Swan Electric Co., Ltd.

Metropolitan Water Board.—Recommended:—
Nine mechanical stokers (£2,215).—James Hodgkinson (Salford), Ltd.
Coal-handling plant and bunkers (£1,786).—Hepburn Conveyor Co., Ltd.

Camberwell.—Finance Committee. Recommended:—
Maintenance of electric lighting, heating and power installations at Town Hall and public buildings for the year.—Commercial Telephone and Electrical Co., Ltd.

Islington.—*Correction.*—The name of one of the contractors for the supply of electric lamps for 12 months recorded on page 437 of the March 18th issue is Nelson Electric Co., Ltd., of Merton Park, S.W. (not Milton Electrical Co., Ltd.).

Battersea.—Electricity Committee. Recommended:—
Cable (annual contracts).—Callender's Cable & Construction Co., Ltd.
Electricity meters.—Chamberlain & Hookham, Ltd., and Ferranti, Ltd.
Bitumen.—Dussek Bitumen Co., Ltd.
Transformers at premises of Messrs. Garton & Co., Ltd. (£419), and for Latchmere Road sub-station (£267).—British Electric Transformer Co., Ltd.

Manchester.—According to the *Manchester Daily Dispatch*, a £4,000 contract for a generator and other electrical equipment has been placed by the Corporation Electricity Committee with a Belgian firm, and a question as to why it was not given to a British company will be asked at the next meeting of the City Council. The lowest offer by the British tenderers, which included some in Manchester, competing for the offer, was over £1,000 higher than that quoted by the Belgian concern.

South Africa.—Cape Town.—Electricity Committee. Accepted:—
775 yd. cable (manufactured by Deutsche Kabelwerke A.G.) (£303).—A. Vaux, Ltd.
Four 40-kVA transformers (£263).—Metropolitan-Vickers Electrical Co., Ltd.

Johannesburg.—Union Tender Board.
Dry cells and battery material for the Posts and Telegraphs Department.—British General Electric Co., Ltd., Siemens Bros. & Co., Ltd., and the South African General Electric Co., Ltd.
—*S.A. Mining and Engineering Journal.*

Spalding.—Urban District Council. Accepted:—
38 pumps and electric motors for the new sewage scheme (£7,516).—Pulsometer Engineering Co., Ltd.

Swinton and Pendlebury.—Urban Council. Accepted:—
750-kVA transformer for the Bridge Street sub-station (£568).—Ferranti, Ltd.

Tain.—Accepted:—
Installing electric lighting at the new church hall.—A. Cameron.

The "Electrical Review" Service Department.

Inquiries must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—

Sure Grip shade holders.
Wilson ice cream freezer.

Forthcoming Events.

Physical Society.—Friday, March 25th. Imperial College of Science, S.W. 5 p.m. Ordinary meeting.

Birmingham Electric Club.—Friday, March 25th. Grand Hotel. 7 p.m. "Electricity Supply in the Midland Area." Mr. S. T. Allen.

North-East Coast Institution of Engineers and Shipbuilders.—Friday, March 25th. Newcastle-on-Tyne. 6 p.m. "Pure Science." Sir Richard Glazebrook, F.R.S.

Royal Institution.—Saturday, March 26th. 3 p.m. "Alpha Rays and Atomic Structure." Sir Ernest Rutherford, F.R.S.

Electrical Power Engineers' Association (Northern Division).—Saturday, March 26th. Midland Hotel, Manchester. 5.30 for 6 p.m. Annual dinner.

(Southern Division).—Friday, April 1st. Institution of Electrical Engineers, London. 7 p.m. "Principles of Operation and Modern Application of Automatic Voltage Regulators." Mr. H. E. Angold.

Electrical Supply Commercial Association (Greater London Division).—Saturday, March 26th. Poland Rehearsal Rooms. 7.45 p.m. Dance.

Nottingham Society of Engineers.—Monday, March 28th. Victoria Station Hotel. 7.30 p.m. "Ten Minutes' Papers."

Royal Society of Arts.—Monday, March 28th. 8 p.m. Cantor Lecture. "Some Industrial Applications of Electrothermics." Mr. G. I. Finch.

Institutions of Civil, Mechanical, Electrical, Municipal and County, and Locomotive Engineers (Yorkshire Sections).—Joint delegation. Wednesday, March 30th. Mappin Hall, Sheffield. 7 p.m. "Railways or Roads."

Institution of Production Engineers.—Wednesday, March 30th. 83, Pall Mall, S.W. 7.30 p.m. "The Development of Rustless and Allied Steels." Dr. W. H. Hatfield.

Faraday Society.—Wednesday, March 30th. Burlington House, Piccadilly, W. 3 p.m. Second Experimental Report to the Atmospheric Corrosion Research Committee. Dr. W. H. J. Vernon.

Institution of Electrical Engineers.—Thursday, March 31st. London. 6 p.m. "The Applications of Electricity in Warships." Mr. W. McClelland.

(North-Eastern Centre).—Monday, March 28th. Literary and Philosophical Society, Newcastle-on-Tyne. 7 p.m. "The Number of Tests Required to Establish the Rupturing Capacity of an Oil Circuit Breaker." Messrs. W. B. Whitney, C. E. R. Bruce, and E. B. Wedmore.

(South-Midland Centre).—Wednesday, March 30th. University, Birmingham. 7 p.m. "The Stability of Large Power Systems." Mr. F. H. Clough.

Edinburgh Electrical Society.—Thursday, March 31st. Royal Scottish Society of Art. 8 p.m. "Manufacture of Conduits." Mr. C. H. Walker.

Institution of Mechanical Engineers.—Informal Meeting.—Friday, April 1st. London. 7 p.m. "British Empire and Overseas Trade." Major A. W. Farrer.

Notes.

Retford Electricity Undertaking.

On March 21st the Mayor of Retford, Coun. J. W. Iremonger, officially inaugurated the new electricity undertaking at Retford, which was described in our last issue. At the ceremony, Alderman W. N. Brackett, J.P., chairman of the Electricity Committee, pointed out that the Corporation had been allowed to erect a power station apart from the super stations which were being erected all over the country. A unique feature of the undertaking was the installation of a waste-heat boiler for generation purposes. At a celebration luncheon which followed the opening, Viscount Galway, in proposing the "Retford Electricity Undertaking," said that he hoped the new electricity scheme would bring further prosperity to the town. Mr. A. Hugh Seabrook, consulting engineer for the scheme, supported the toast and said that the new power station was the first where, by harnessing the gas works to the undertaking, the waste heat was turned into electricity for the use of the town. With regard to the elaborate foundation work, it was the first occasion that the particular process had been used, except in collieries and abroad. Even if the town were in the future obliged to take a supply in bulk from one of the great power stations nothing would be wasted. Ald. Brackett, in reply, said that the subject of electricity was first raised in Retford in 1904, and the first clause of a petition presented to the Town Council against the proposal read: "That the electric light is not the light of the future, and is in no way likely to supersede gas either as an illuminant or for heating purposes." The present Order was granted in 1924, and in 1925 the Corporation decided to go on with the scheme. Sanction had been obtained for loans amounting to £51,000, but probably the cost of the undertaking was now in the neighbourhood of £40,000. Ald. Williamson gave the toast of "The Contractors," and Mr. H. N. Bickerton, of the National Gas Engine Co., replied.

In the article on Retford's electricity supply in our last issue we referred to one of the air compressors as being driven by a G.E.C. motor. We are informed by the main contractors for the generating plant, the Electric Construction Co., Ltd., that this is incorrect, and should read "driven by an E.C.C. motor."

Late Legal.

British Thomson-Houston Co., Ltd., *v.* Metropolitan-Vickers Electrical Co., Ltd.

Lords Dunedin, Sumner and Blanesburgh this week continued the hearing in the House of Lords of the appeal: the British Thomson-Houston Co., Ltd., *v.* the Metropolitan-Vickers Electrical Co., Ltd. The question in dispute is whether the Letters Patent of 1912 granted to Emanuel Rosenberg (of which the respondents are legal owners) is valid. Both Mr. Justice P. O. Lawrence and the Court of Appeal found infringement by the appellants, but while the former held the patent to be invalid, the latter declared it to be valid, and the question of validity was therefore taken to the House of Lords. The patent, which, the appellants maintain, is invalid, as being anticipated by the Tesla specification of 1891, is for an invention of improvements relating to synchronous dynamo-electric machines. Their Lordships reserved judgment.

The Electricity of Dust Clouds.

A paper on the above subject submitted at a recent meeting of the Physical Society of London by Mr. G. B. Deodhar, M.Sc., Physics Department, University of Allahabad (India), was taken as read in the absence of the author. Observations on the electrification of various dusts have been made by using a large volume of air at a high speed. In some cases the sign of electrification observed agrees with that found by Rudge. It appears that the electricity developed is of a frictional nature; quantitative estimates show that chlorides of sodium and potassium are equally effective, but sodium nitrate is about 4½ times as efficacious as potassium nitrate. It is shown graphically that, other things being the same, the number of volts developed by blowing increases very rapidly as the size grows less. Dr. P. E. Shaw has recently sent a paper bearing on this topic to the Society. The effects, however, which he obtained are due to the impact of only two like bodies, and in this way the condition of the impacting surfaces can be ascertained and varied at will.

Boiler Explosion Report.

We have received a copy of the report on a preliminary inquiry into the cause of the explosion of a water-tube boiler at the power station of the Merthyr Electric Traction & Lighting Co., Ltd., Merthyr Tydfil, Glamorganshire, in November last, when one of the tubes ruptured for a length of about 12 in. The explosion was caused by the overheating of the tube due to an insufficient quantity of water in the boiler. It is not clear how the explosion could have occurred. Although water showed in the gauge glass, the low-water alarm was blowing 15 mins. before the explosion. The attendant, who blew the gauge glass through and found no water, appears to have been slow in taking the necessary action. It seems probable that when the fire was first lighted the water level was already dangerously low.

Courses for Teachers in Technical Schools.

The Board of Education is making arrangements for short courses to be held in the summer for teachers in recognised technical schools, &c., in England and Wales, including Engineering Science and Electrical Engineering, at Oxford. Teachers who desire to attend any of these courses must make application to the Board of Education as soon as possible, and in any case before April 13th, 1927.

National Coal Resources Survey.

In pursuance of the physical and chemical survey of the national coal resources, which is one of the main aspects of the fuel research work of the Department of Scientific and Industrial Research, a committee has been appointed to deal with the survey of the coalfields of Durham and Northumberland. Committees are already at work in five other areas.

Electrical Association for Women.

At the invitation of the General Electric Co., Ltd., over 80 London members of the above Association visited the Ideal Home Exhibition, Olympia, on March 16th, and they were particularly interested in many of the company's exhibits.

The last of the series of evening lectures, which will be held on April 6th, is to take the form of an informal social evening. A short lecture will be given on women's place in the American electrical industry, after which there will be a discussion on the possibilities of trained women playing a greater part in the domestic electrical development of this country.

The inaugural meeting of the South Wales and Monmouthshire Branch of the Association was to be held at the City Hall, Cardiff, on March 24th, when the Viscountess Rhondda, J.P., was to be appointed as the first president of the branch, and Mrs. Tyler the hon. secretary.

Appointments Vacant.

Chief engineer (£312) for the Greenwich and Deptford Institution and Hospital. Sub-station attendant (79s.) for the Stoke Newington Borough Electricity Department. Engineer for the Red Hill Hospital, Edgware (£5). Draughtsmen and technical officer for illumination work for the Royal Aircraft Establishment. Shift charge engineer for the Crewe Corporation electricity works. Electrical assistants in the Chief Engineer's Department (97s. 3d.) for the L.C.C. (See our advertisement pages to-day.)

Electric Vehicle Parade.

On Saturday afternoon, March 26th, the Commercial Motor Users' Association will hold its annual parade of commercially-driven vehicles in Lincoln's Inn Fields, London. On this occasion there will be a very representative display of electric road vehicles, various types and sizes; about 25 entries have been received. A silver plaque and certain prizes are being awarded in this class by the Electric Vehicle Committee of Great Britain. The judges will be Col. R. E. Crompton, Mr. A. E. McKenzie, and Mr. A. C. Cramb.

Electric vehicles have been entered in the parade by the following firms, amongst others:—Brown & Polson, Ltd.; Carlyle Laundry; Carter, Paterson & Co., Ltd.; Chloride Electrical Storage Co., Ltd.; Hackney Borough Council; Hovis, Ltd.; Liberty & Co., Ltd.; London Wholesale Dairies, Ltd.; Meux's Brewery Co., Ltd.; Savoy Hotel, Ltd.; Watney, Coombe & Reid, Ltd.; and the Willesden Urban District Council.

Research and the Metal Industries.

An exhibition which has been opened to the public at the Science Museum, South Kensington, affords some indication of the assistance given to British metal industries by the research and auxiliary services of an industrial research organisation, the British Non-Ferrous Metals Research Association, which, with the co-operation of the industry through membership of the Association, carries on research work and maintains a highly organised information service. The exhibition is concerned chiefly with eight of the Association's researches, chosen from among 18 major investigations at present in progress. Those selected are typical of the character and wide range of the work which is being done, and the exhibits have been set out to give some idea of the scope of each piece of work and the progress which has so far been made. They include the effect of impurities on the properties of copper, gases in copper castings, the jointing of metals, die casting alloys, and "wiped" plumbers' joints.

A Conference on Dimensions of Nuts and Bolt Heads.

An important conference of makers of bolts and nuts, as well as the engineers who use them, is being convened by the Screw Threads Committee of the British Engineering Standards Association, and will take place in London on Wednesday, March 30th. The object is to discuss the question of the width and thickness of nuts and bolt heads from the standpoint of the practicability of a reduction on the standard sizes ordinarily used.

The Continental countries which have adopted the Whitworth screw thread as one of their standards have been using nuts which are smaller than the British Standard Whitworth, and as the question of arriving at a uniform standard is engaging their attention as well as that of the United States of America, and the B.E.S.A., as the national standardising body in Great Britain, has been invited to participate, the Screw Threads Committee has felt it desirable to make itself acquainted with the wishes of both makers and users concerned. Invitations to send delegates to the conference have been sent to a large number of institutions, trade associations, etc., and any who may be interested in the matter are invited to communicate with the Secretary of the British Engineering Standards Association, 28, Victoria Street, Westminster, S.W.1.

Fatality.

Fred. Green, employed at Sherdley collieries, St. Helens, on March 17th received a fatal electric shock whilst attending to the h.p. switchgear which controls the main shaft pump.

The Electro-Deposition of Rubber.

Writing to *Nature* of March 12th, Mr. S. E. Sheppard states that although rubber is a non-conductor, the deposit of latex rubber particles, with or without other filling material, forms a spongy gel which is still permeated by the intermicellar liquid, which, of course, is an electrolytic conductor. Consequently the electro-deposited rubber is not actually an insulator, but is perfectly analogous to a porous diaphragm electrolytically connected with a metallic anode. Such limitations as exist with regard to the thickness of coating depend mainly on other conditions, therefore, than the formation of an insulating layer.

The subject was referred to on p. 155 of our issue of January 7th, 1927.

B.E.S.A. Publication.

The British Engineering Standards Association has recently issued a new B.S.S. No. 142, 1927, for electrical protective relays. This forms one of a series of specifications for electrical instruments which is about to be issued. The relays dealt with are classified according to the functions they perform, and to the constructional principles involved. Relay contacts are also classified according to their function and mode of operation. The specification proper deals with the limits of current-, voltage-, and time-setting; the rating of the contacts; consumption of the relays; limits of error; and insulation and voltage tests, &c. The specification should prove of great interest to power-station engineers and other users of protective relays, as although it is concise it deals with the specification and performance of relays in a very comprehensive manner. Copies of this new specification may be obtained from the B.E.S.A., Publications Department, 28, Victoria Street, London, S.W.1, price 2s. 2d., post free.

Manchester Steam Users' Association.

The annual report of the Committee of Management of the Manchester Steam Users' Association shows that for the year ended December 31st, 1926, the revenue of the Association was £41,533, and that after meeting all expenses there was a surplus of £3,627. The total number of examinations of boilers made during the year was 26,045. The fact that the Association has again been able to repeat that during the whole of its existence, 72 years, no preventable explosion has occurred on any boiler which has borne the Association's guarantee and certificate of safety is claimed as a tribute to the thoroughness with which the work of inspection is carried on. During the period under review reports were received of 55 preliminary inquiries held by the Board of Trade under the Boiler Explosions Acts of 1882 and 1890. The membership at the end of the year was 1,717.

I.E.E. Students' Dinner.

The 20th annual dinner of the London Students' Section of the Institution of Electrical Engineers was held at the Imperial Hotel, Russell Square, London, on March 18th, when Mr. E. H. Harwood, chairman, presided. In proposing "The Institution of Electrical Engineers," Mr. S. H. Hart, hon. secretary, thanked the Council for the help which the Section had received from it, particularly with regard to the Students' Continental tour last year.

Dr. W. H. Eccles, in reply, commented on the affection which was shown in all sections of the Institution. The body was making itself felt in all walks of life. The strength brought about by the unanimity of the members was due to the diversity in the representation of all the branches of the industry.

Mr. R. Paul, the Council's representative, in proposing "The Students' Section," impressed upon the Students the necessity of stimulating the imagination. The Council was pleased at the increasing tendency of the Students to take part in the discussions at the meetings. There were now 6,300 Students in the Institution ranks. He congratulated the Section on the high quality of the papers presented at its meetings.

Mr. E. H. Harwood replied, and said that the outstanding feature of the past year's work of the Section was the joint meetings which had been held with the Civil and Mechanical Institutions. It was a good sign that the visits of the Section were always full.

Mr. R. A. Brockbank, vice-chairman, in proposing "Our Guests," heartily welcomed the visitors present, of whom Dr. Eccles was the guest of the evening.

In a breezy reply, Capt. P. P. Eckersley, chief engineer of the British Broadcasting Corporation, pointed out the necessity for the technical and commercial sides of the profession to see each other's points of view. In commenting on the work of the B.B.C., he said that the one thing which would keep British broadcasting to the front was good engineering. He extended an invitation to any of the members to visit the B.B.C. studios and see what was being done.

E.P.E.A. Dinner.

The seventh annual dinner of the London Western Section of the Electrical Power Engineers' Association was held at St. Ermin's Hotel, Westminster, on Saturday last, Mr. W. E. Rogers, chairman of the Section, presiding.

After the loyal toast, Mr. A. C. Stewart, junior vice-president, proposed "The Association." He compared the position of the electricity supply engineer before the advent of the E.P.E.A. with that of to-day, and enumerated some of the advantages that the Association had brought about for its members. The evil of the premium pupil had been greatly reduced, although it still existed to some extent. He warned the members of the danger of becoming slack as a result of the success of the Association, and declared that a properly organised electricity supply industry was now impossible without such a protective body as theirs.

In reply, Mr. A. W. Crompton, president, said that the prestige of the Association had in no way suffered as a result of the history of the past two years. There were now over 4,000 members. The privilege which they had during the general strike of maintaining to some extent law and order gave them the right to criticise the industrial position. A fact that was not fully realised was that, whatever was forthcoming from the Electricity (Supply) Act, the job rested with the technical engineer. If the chemical industry could cover the displacement of its employés, then the electricity industry should also be able to.

In proposing "Our Section and Our Chairman," Mr. E. G. Hildebrand paid a tribute to Mr. Rogers, who replied in a suitable manner.

During the evening musical items were rendered by a number of artistes.

Extensions at Basingstoke.

An interesting ceremony took place recently at the Basingstoke electricity works, when the new extensions to the generating plant were started up. The new equipment includes a 600-h.p. Diesel oil engine, by Messrs. Mirrlees Bickerton and Day, Ltd., directly coupled to a 410-kW generator manufactured by the General Electric Co., Ltd. The engine is of the 6-cylinder totally-enclosed type and runs at 250 r.p.m. The cylinder bore is 17¼ in., and the stroke 20 in. The new plant brings the total capacity of the station up to 1,530 kW. The maximum load recorded to date is 916 kW.

Newton's Bicentenary.

Last week-end the 200th anniversary of the death of Sir Isaac Newton was celebrated by a meeting of scientific and mathematical men at Grantham, his birthplace. Dr. Jeans, secretary of the Royal Society, presided at a meeting at the King's School, where Newton was taught, and declared that he was the greatest man of science that the human race had ever seen. Sir J. J. Thomson delivered an address dealing mainly with Newton's optical work, and Sir Frank Dyson lectured on his work in astronomy, which alone had placed him above all other scientific investigators. Other speakers dealt with Newton's mathematical achievements.

Institution Notes.

Institution of Electrical Engineers.

North-Midland Centre.—The following nominations have been made by the Committee for vacancies arising September 30th, 1927:—Chairman, Mr. J. Edwin Storr; vice-chairmen, Messrs. F. S. G. Hinings and C. Nelson Hefford; hon. secretary, Mr. H. Cecil Fraser; committee (five vacancies), Messrs. H. G. Fraser, W. P. Bramwell, P. Maxwell, R. M. Longman, W. F. Mylan, and L. H. Roberts.

Summer Meeting.—The summer meeting of the Institution will be held at the North-Eastern Centre, in and around Newcastle-on-Tyne, from June 14th to 17th.

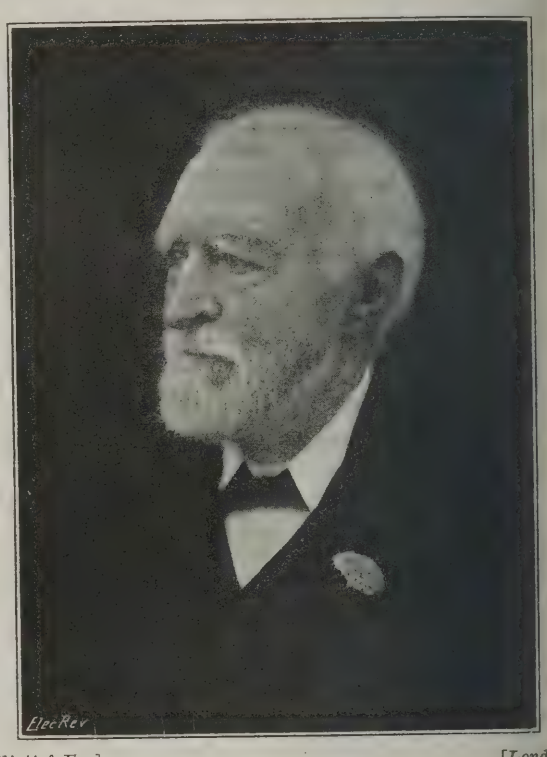
Western Centre.—Home lighting was the subject of a lecture delivered by Mr. R. B. Mitchell, of Glasgow, to the members of the Institution at the University College of the South-West, Exeter, on March 14th. He stated that there were eight million unwired houses in Great Britain; if each required on an average nine lights (taking £10 as the average cost of wiring), an expenditure of 80 million pounds on installation work alone would be involved, leaving out of account altogether the extra plant which would be required at the power stations. Notwithstanding the fact that between 60 and 70 per cent. of the homes of Great Britain were within the areas of electricity supply undertakings, data showed that only about 14 or 15 per cent. of them were wired.

South-Midland Wireless Sub-Section.—The fourth meeting of the Wireless Sub-Section of the Institution of Electrical Engineers (South-Midland Centre) was held at Birmingham on March 16th, when Mr. C. Robinson, B.A., lectured on the "Characteristics of Audio-frequency Amplifiers used in Telephonic Repeaters." The lecture was preceded by a visit to the Birmingham Post Office telephone repeater station in Hill Street, where members spent an interesting time inspecting various sections of the plant. Tea was partaken of at Birmingham University, where the meetings are held.

Institution of Chemical Engineers.

Examinations for the Associate Membership of the Institution will be held in June and July next. Particulars can be obtained from the hon. registrar, Mr. C. S. Garland, Abbey House, Westminster, S.W. (See our advertisement pages to-day.)

Our Personal Column.



Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.

Reference was made to the illness of Mr. James Taylor at the meetings on Monday last of the British Insulated Cables, Ltd., and the Midland Electric Corporation for Power Distribution, Ltd., of both of which companies he is chairman. Sir Arthur Stanley, who presided in his place at the former company's meeting, stated that Mr. Taylor underwent a serious operation in November, and was now in the south of France. Mr. Sinclair, who acted as chairman at the Midland Electric meeting, said that Mr. Taylor was expected back in this country in a few weeks. The hope expressed by both speakers that he will shortly be able to resume his active interest in the affairs of the businesses with which he has so long been connected will be shared by a large number of Mr. Taylor's friends in the electrical industry.

Mr. L. A. Horsfall, of Ing Lees, Marsden, has resigned his position as manager of Messrs. E. Brook, Ltd.'s, Leicester office, and has taken over the sole representation in the Midlands of the B.E.N. Patents, Ltd., 96-98, Victoria Street, S.W.1.

After 26 years' service with the Manchester Corporation Tramways Department, Mr. F. E. Handy, electrician, and latterly general sheds foreman, retired last week. Mr. Handy has seen service with the Vancouver and New Westminster Tramways and the Hamilton and Barnsville Railway Company, and was foreman of the Stoke-on-Trent Tramways from 1898 to 1901.

The Electrical Review sends its greetings and hearty congratulations in advance to Mr. George Offor, of Peak Hill, Sydenham, who, on Wednesday next, March 30th, reaches the great age of 100 years. In the days of his youth—some twenty years ago—Mr. Offor was a frequent and much esteemed contributor to our pages, and he was able to climb over difficult stone staircases with a spirit and energy which filled many a younger man with envy. We reproduce the accompanying photograph from our Jubilee Issue of November 17th, 1922, where, on p. 704, a brief account of Mr. Offor's electrical record was given. He has as full a knowledge of anybody of early electric lighting legislation and finance in this country, counting among his other offices that of membership of Lord Thurlow's Committee appointed to consider the amendment of the Electric Lighting Act of 1882. When Mr. Offor reached his eightieth birthday electrical friends gave a dinner in his honour. Since then electricity supply has

Elliott & Fry] [*London*

Mr. George Offor,
who celebrates his 100th birthday on March 30th.

made wonderful strides, and we wish the centenarian of the electrical industry years of happiness and health in which to witness the acceleration of the pace of progress which is now being recorded.

Mr. W. Preston, M.P. for Walsall (who, as our readers know, is prominently associated with the electrical industries) was given an enthusiastic welcome home by hundreds of his constituents at Walsall Town Hall on Monday last week. Mr. Hurst, chairman of the local Unionist Association, presided, and referred to the illness of Mr. Preston while he was in South Africa. Mr. Preston, he said, went to South Africa not only for his health, but also to try and improve the trade of the town. Mr. Preston said that if manufacturers would get into personal touch with our own people in the Colonies they would have a reception they little dreamt of, as the Colonies were out to do big business with English manufacturers.

Bedford Corporation Electricity Committee recommends the appointment of Mr. N. Fleming, now assistant, as station superintendent, at a salary of £520 per annum, and the promotion of Mr. A. Wilson, charge engineer, to assistant station superintendent, at a salary of £360 per annum.

The marriage took place recently at Grimsby of Mr. H. director of Pye & Co., Ltd., wireless manufacturers, Cambridge, and Miss Jennie Milson.

Mr. Henry Rowe, of Messrs. H. Rowe & Co., electrical engineers and importers, of Melbourne, Australia, is expected in London early in May, and he asks that firms requiring representation in Australia will communicate with him at The Electrical Review.

The appointment of Mr. John Reeve Brooke as secretary to the Central Electricity Board is announced. For the past two years Mr. Brooke has been secretary of the Ministry of Transport. The offices of the Board are to be at No. 1, Charing Cross, S.W.1.

The Associated Municipal Electrical Engineers has drawn the attention of the Battersea Electricity Committee to the fact that the electrical engineer (Mr. F. A. Bond) is not being paid in accordance with the agreed scale. The Committee accordingly recommends that Mr. Bond's salary should be raised from the present figure of £1,300 to £1,349.

Obituary.—Sir John Turney.—The death occurred on [arch 17th of Sir John Turney, of Nottingham. Sir John, ·ho was 88 years of age, was chairman and managing director ? a prominent industrial concern in the city. His connec·on with municipal affairs dates back to the year 1873, when e entered the Nottingham Town Council, and he was the first ıairman of the Electricity Committee.

Mr. E. F. Carson.—In the same issue our contemporary ·corded the death of Mr. Edwin F. Carson, labour agent for lessrs. Balfour, Beatty & Co., on their Lochaber water-power ·heme. Mr. Carson was motor-cycling home from Fort ;illiam when he ran into a man. He was thrown from his ;achine and sustained a fractured skull.

Mr. J. Thomson.—*The Times* reports the death of Mr. John homson, sole partner in the firm of Provand & Cairns, elec·ical engineers, Glasgow, as a result of a motor accident. He as driving the car at night and instead of running upon a ·idge over the River Strae, swerved to the side, and the car ıshed down a steep bank into the river.

Mr. M. J. L. Calli.—The death has taken place, at the age of 58 years, of Mr. M. J. L. Calli, who for upwards of 30 years had been on the staff at the electrical works of Messrs. Newton, of Taunton.

Mr. A. A. Dudley.—The death took place recently at the age of 57 years of Mr. A. A. Dudley, who had held the position of engineering superintendent of the Wolverhampton District Electric Tramways, Ltd., and for 37 years had been connected with the system in the South Staffordshire area.

Mr. W. J. Copsey.—The death is announced at the age of 50 years of Mr. William James Copsey, who was formerly assistant engineer at Grantham for the Urban Electric Supply Co. Latterly he had been with Messrs. Harrison & Co., electrical engineers, Newark-on-Trent.

Wills.—Sir A. S. Haslam, of the Haslam Foundry and Engineering Co., left (according to the *Financial Times*) estate valued at £1,640,000.

The late Sir Wilfrid Stokes left £55,467 gross and £35,186 net personalty.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Northern Radio and Electrical Factors, Ltd.—Private mpany. Registered March 10th. Capital, £2,000 in £1 ares (1,000 7½ per cent. cumulative participating preference d 1,000 ordinary). Objects: To carry on the business of ·ctrical, mechanical and general engineers and contractors, anufacturers and factors of and dealers in electrical or her apparatus, radio instruments, wireless apparatus, &c. ıe directors are:—Mrs. E. Tempest, 22, Oak Lane, Manning·m, Bradford; G. W. Tempest, 22, Oak Lane, Manningham, ·adford, electrical engineer. Qualification, £1. Solicitors: W. Butterfield & Co., 12, Devonshire Street, Keighley.

Wand & Mitchell, Ltd.—Private company. Registered ırch 14th. Capital, £500 in £1 shares. Objects: To carry the business of dealers in wireless in all its applications, ·ctrical outfitters, dealers in electrical appliances, motor rriers, dealers in motor cars and accessories, &c. The first ·ectors are:—S. Wand, 369, Bury New Road, Higher oughton, Manchester; H. Michaelson, 239, Waterloo Road, ghtown, Manchester (both permanent, subject to each hold· five shares). Registered office: 239, Waterloo Road, High·wn, Manchester.

East Suffolk Electricity Distribution Co., Ltd.—Regis·ed as a public company on March 17th, with a nominal pital of £50,000 in 30,000 preferred ordinary shares of £1 ch and 40,000 deferred ordinary shares of 10s. each. The ofits available for distribution in any year are to be applied, st, in paying a cumulative dividend at 7 per cent. per num on the original preferred ordinary shares, secondly, paying a further dividend not exceeding 3 per cent. for ch year on the same shares, and, *pari passu*, with such ·ther dividend in payment of a sum of like amount by y of dividend for such year on the deferred ordinary shares, d, thirdly, in payment of any balance of such profits to · holders of the deferred ordinary shares. The objects · to carry on the business of an electric light and power mpany in all its branches. The subscribers (each with e share) are:—W. Mitchell, 24, Twyford Road, Ilford, sex, clerk; A. J. Clark, 114, Barrington Road, N.8, icitor's clerk; and five other clerks. The directors are to mber not less than three nor more than seven. The easury is to be represented by one director. The Power velopment Co., Ltd., may appoint two directors. Except aforesaid, the directors are to be appointed by the scribers. Qualification (except Treasury director, alternate ectors and managing director (if any), who require none), 50 shares. Solicitors: Ashurst, Morris, Crisp & Co., 17, rogmorton Avenue, E.C.

Wireless Piano Players, Ltd.—Private company. Regis·ed March 16th. Capital, £6,600 in 6,000 8 per cent. cumu·ive participating preferred shares of £1 each and 6,000 erred shares of 2s. each. Objects:—To acquire, perfect, d commercially exploit an invention or process for the ·ctro-magnetic reproduction of wireless reception by the no and other similar instruments, &c. The subscribers :—L. E. Read, 93, Fairfax Road, Hornsey, N.8, solicitor's clerk; R. J. Mole, 28, Avenue Road, Kingston-on-Thames, Surrey, solicitor's clerk. The first directors are to be appointed by the subscribers. Qualification, £100 shares or stock. Solicitors: Denton, Hall & Burgin, 3, Gray's Inn Place, W.C.1. Registered office: 17, Victoria Street, S.W.1.

Junit Manufacturing Co., Ltd.—Private company. Registered March 16th. Capital, £2,000 in £1 shares. Objects: To acquire the business now carried on at 2, Ravenscourt Square, Hammersmith, as the "Rexo Engineering Co."; to adopt an agreement with H. T. Logan, and to carry on the business of mechanical, electrical, radio and general engineers, founders, smiths, machinists, tool makers, metal and wood workers, &c. The subscribers (each with one share) are:—L. J. R. King, Glen Cottage, Upper Warlingham, Surrey, incorporated accountant; J. T. Chalk, "Fairview," Upton Road, Bexley Heath, Kent, engineer. L. J. R. King signs documents as director. Qualification, £1. Solicitors: Godfrey Warr & Co., 85, Gracechurch Street, E.C.3. Registered office: Napier House, 24-7, High Holborn, W.C.1.

Official Returns of Electrical Companies.

Farndons Electric, Ltd.—P. H. Stone, of 47, Temple Row, Birmingham, ceased to act as receiver or manager on March 7th, 1927.

Electric Fans, Ltd.—Debenture dated February 25th, 1927, to secure £1,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holder:—S. J. Flatau and B. Freedman, both of 6, Conduit Street, W.1.

East India Tramways Co., Ltd.—Capital, £125,000 in 15,000 preferred, 35,000 ordinary, and 75,000 deferred shares of £1 each. Return dated December 8th, 1926. 7,476 preference, 33,433 ordinary, and 75,000 deferred shares taken up. £7,489 paid on 7,476 preference and 7 ordinary shares, and including £6 paid on 24 preference shares forfeited. £108,426 considered as paid on 33,426 ordinary and 75,000 deferred shares. Mortgages and charges, nil.

Edward Deane & Beal, Ltd.—Capital, £60,000 in 20,000 preference and 40,000 ordinary shares of £1 each. Return dated December 30th, 1926. 20,000 preference and 20,009 ordinary shares taken up. £9 paid. £40,000 considered as paid. Mortgages and charges, £6,250.

D. Hulett & Co., Ltd.—Capital, £5,000 in £1 shares. Return dated November 11th, 1926. 4,420 shares taken up. £320 paid. £4,100 considered as paid. Mortgages and charges, nil.

Hall Telephone Accessories, Ltd.—Capital, £30,000 in £1 shares. Return dated December 16th, 1926. All shares taken up. £6,501 paid (being £1 per share on 2 and 10s. per share on 12,998 shares). £17,000 considered as paid on 17 000 shares. Mortgages and charges at date of return, nil. Since registered: Debenture dated January 6th, 1927, to secure £25,000.

Harry Morser & Co. (Wireless), Ltd.—H. E. F. Connolly, of 12, Nutley Lane, Reigate, was appointed receiver on March 3rd, 1927, under powers contained in debenture dated November 30th, 1925.

Pickvance, Ltd.—Capital, £5,000 in 2,000 preference and 3,000 ordinary shares of £1 each. Return dated January 3rd, 1927. 600 preference and 1,002 ordinary shares taken up. £650 paid on 450 preference and 200 ordinary shares. £952 considered as paid on the remainder. Mortgages and charges, £1,650.

Peacehaven Electric Light and Power Co., Ltd.—Capital, £20,000 in 15,000 preference shares of £1 each and 20,000 ordinary shares of 5s. each. Return dated November 8th, 1926. 14,038 preference and 16,052 ordinary shares taken up. £17,909 18s. 1d. paid, leaving £141 1s. 11d. in arrears. Mortgages and charges, nil.

Davis Electrical Co., Ltd.—Capital, £1,000 in £1 shares. Return dated December 31st, 1926. 677 shares taken up. £377 paid. £300 considered as paid. Mortgages and charges, nil.

Brookhirst Switchgear, Ltd.—Capital, £550,000 in £1 shares. Return dated December 27th, 1926. 126,002 shares taken up. £30,502 paid. £95,500 considered as paid. Mortgages and charges, £25,000.

Western Telegraph Co., Ltd.—Capital, £3,500,000 in £10 shares. Return dated December 9th, 1926. 311,895 shares taken up. £2,339,650 paid. £779,300 considered as paid. Mortgages and charges, £818,675.

Venezuela Telephone and Electrical Appliances Co., Ltd.—Capital, £280,000 in 140,000 ordinary and 140,000 preference shares of £1 each. Return dated December 21st, 1926. 103,091 ordinary and 103,091 preference shares taken up. £149,676 paid on 46,585 ordinary and 103,091 preference shares. £56,596 considered as paid on the remainder. Mortgages and charges, £140,300.

Bullers, Ltd.—Capital, £400,000 in 20,000 ordinary and 20,000 preference shares of £1 each. Return dated December 31st, 1926. 15,593 ordinary and 15,000 preference shares taken up. £150,070 paid on 7 ordinary and 15,000 preference shares. £155,860 considered as paid on 15,586 ordinary shares. Mortgages and charges, £217,800.

Southern Electric Free Wiring Co., Ltd.—Capital, £5,000 in £1 shares. Return dated December 29th, 1926. 1,510 shares taken up. £1,510 paid. Mortgages and charges, nil.

Delagoa Bay Development Corporation, Ltd.—Capital, £166,300 in 267,400 ordinary shares of 10s. each and 130,400 preference shares of 5s. each. Return dated December 7th, 1926. 267,400 ordinary and 68,400 preference shares taken up. £105,800 paid on 177,400 ordinary and 68,400 preference shares. £45,000 considered as paid on 90,000 ordinary shares. Mortgages and charges, £231,100.

Davies, Kent & Stewart, Ltd.—Capital, £3,500 in 2,500 preference and 1,000 ordinary shares of £1 each. Return dated December 28th, 1926. 1,974 preference and 1,000 ordinary shares taken up. £2,974 considered as paid. Mortgages and charges, £1,050.

W. G. Cannon & Sons, Ltd.—Capital, £3,000 in £1 shares. Return dated December 31st, 1926. All shares taken up. £9 paid. £2,991 considered as paid. Mortgages and charges, nil.

British Brown, Boveri, Ltd.—Capital, £50,000 in £5 shares. Return dated November 25th, 1926. All shares taken up. £21,250 paid (being £2 10s. per share on 8,500 shares). £7,500 considered as paid (being £5 per share on 1,500 shares). Mortgages and charges, nil.

Implitico, Ltd.—Capital, £3,000 in £1 shares. Return dated December 20th, 1926. All shares taken up. £3,000 paid. Mortgages and charges, nil.

City Notes.

Marconi's Wireless Telegraph Co., Ltd.

As mentioned in our last issue, the annual meeting took place on March 13th. Senatore Marconi presided, and there was a very large attendance of shareholders. The proceedings, which lasted about five and a-half hours, were at times interrupted, but in the end the report was adopted, and the proposals of the board for reducing the capital by £1,625,019, were also carried. The chairman devoted the greater portion of his speech to the technical progress which the company was making. Discussing the "beam" system, he said that it had distinct advantages over the old system, and, moreover, many of those advantages were not possessed by any other method of long distance-communication. The capital expenditure was lower; the stations could be operated with a comparatively small amount of power; the speed of working was limited only by the mechanical limitations of the sending and receiving instruments; the stations could be used for wireless telephony; each circuit could be efficiently utilised for the simultaneous transmission and reception of telephonic as well as telegraphic messages without any mutual interference between the services; and it could be used for *facsimile* transmission and, probably, also for television. The Canadian service, he stated, was handed over to the Post Office for official tests in October of last year and had since been opened to the public and had been working well for four months. The Australian service had been under test by the company during recent weeks, and the previous day the Secretary of the General Post Office had stated that the Australian station had satisfied the conditions of the contract. They had also received a telegram from the Australian company to the effect that during the seven-day tests the average estimated capacity of the service was over 140,000 words per day each way, representing over three times the existing total cable traffic between this country and Australia. Referring to the present position of the company, he said that they had passed through a most trying and critical period. He frankly admitted that many of their difficulties had come about in consequence of past mistakes, but others were caused by circumstances beyond anyone's control. In conclusion, he said he wished to make it quite clear that in the event of the proposals of Mr. Nordon's committee being carried, he could follow no other course but to tender his resignation from the board, and, in consequence, also decline to accept the position of president of the company. With regard to his agreement as technical adviser to the company he regretted to say that in the event of such proposals being approved, he would endeavour to have the agreement terminated at once. The Right Hon. F. G. Kellaway, the managing director, seconded the motion in a long speech, in which he dealt in great detail with the report of the investigating accountants and gave particulars of the losses amounting to a total of nearly £6,000,000 which had been written off. Dealing with the course of events since he became a director he said that at his instigation a committee of directors was formed to control the policy and finances of the company, and one of the first decisions of that body was to put a stop immediately to any further investments of the money in any concerns not properly connected with the company's business. He maintained that in regard to the issue of 500,000 new shares at 27s. 6d. each in February, 1925, on the information before it at the time, the board was fully justified in making the issue at that price. Subsequent events had shown that that information was based upon too optimistic a view of the position of the company at the time, but looking back he could not admit that any precaution was not taken which any reasonable body of business men could have taken. The proposals of the board had the support of Sir Gilbert Garnsey and their own accountants; of the four members of the advisory committee; of the Irish shareholders' association; practically the whole Press of the country, and they had, he said, received proxies representing nearly 1½ million shares. If the report was carried the following new members would join the board on the suggestion of Sir Gilbert Garnsey and a member of the advisory committee:—Lord Inverforth, Major-Gen. Sir Frederick Sykes, Lord Wester Wemyss, Sir Charles Barrie, K.B.E., and Mr. F. R. S. Balfour. In the discussion which ensued speeches were made by Sir Gilbert Garnsey, who gave it as his opinion that given a continuance of good management the company could look forward to a prosperous future by Dr. O'Beirn, of the Irish Shareholders' Committee, supporting the proposals of the Board; and by Mr. Nordon, of the English Shareholders' Committee, who asked the shareholders to reject the report. On a show of hands, the report was adopted by a large majority, whereupon a poll was demanded by Mr. Nordon. This was taken immediately, with the result that the resolution was declared carried by 1,586,532 votes against 320,076. The retiring members of the board were re-elected, and Messrs. Kemp, Chatteris, Nicholls, Send and Co., and Messrs. Price, Waterhouse & Co., were appointed joint auditors.

Telegraph Construction and Maintenance Co., Ltd.

The Earl of Selborne presided over the annual meeting on March 17th, and in moving the adoption of the report (which was dealt with in our last issue, p. 445), said it was satisfactory that in a year of such exceptional difficulties they had been able to present such good results and maintain their usual dividend. At the last general meeting he referred to several important contracts which they had in hand. All of those had been successfully carried out, and in spite of the serious dislocation of trade and delay in deliveries they were able to complete the contracts within a short period of the specified dates. Referring to the position of submarine telegraphy at the present time, they had the fullest confidence in the future of the industry, despite the competition of wireless, be it telegraphic, telephonic, or photographic. A study of the map of the world showed that all great commercial centres were now so well linked up by submarine cable routes that there was little or no fear of any one place being entirely cut off from telegraphic communication. Almost all of these cables were of the ordinary type, but in the last year or so a development of the "loaded conductor" had increased the carrying capacity of a cable by four or five times, and it became evident that if such cables offered no practical difficulties, a revolution in submarine telegraphy was at hand. It was chiefly with that new development that their works had been occupied during the year under review, and three of those cables had been laid in the North Atlantic, one in Australian waters, and one in the Pacific. The load

able had fully justified the confidence which they placed n it and its efficiency had been proved beyond doubt. So ar they might congratulate themselves that such definite nd important progress had been made, but they must remem- er that since the loaded cable was equal in capacity to several rdinary ones, fewer cables might be required in future, nless there was a material increase in telegraph traffic. t was not, however, the experience of the world that im- rovements in machinery or in methods of production defeated heir own ends; every improvement in the means of pro- uction led to increased demand. How to take advantage of hat improvement was the problem of the future for the ubmarine telegraph companies, and it was one which would ndoubtedly be solved by the very able controllers of the able-owning companies. They must, however, expect some elay before the old systems were replaced by the new, for nsiderable expenditure was involved not only in the loaded ables themselves, but also in the research work needed efore full advantage could be taken of their high speed apacity. Their new cable ship *Dominia* was delivered in June st year, and in the recent successful laying of the long ection of the Pacific cable (about 3,500 nautical miles) etween Vancouver and Fanning Island, for which she was pecially built, she fully justified their confidence in her esign.—Mr. Colin F. Campbell seconded the motion, which as adopted after a short discussion.

Westminster Electric Supply Corporation, Ltd.

The annual meeting was held on March 16th, Lord War- ave, P.C. (chairman) presiding. In moving the adoption of e report and accounts, the chairman said that the accounts d had to be prepared in accordance with the London Elec- icity (No. 2) Act, 1925. They had transferred to the London ower Co., under the terms of the above Act, the generating achinery at their Horseferry station, for which they had ceived payment. The whole of the generating portion of e Westminster Company's undertaking had thus passed to e Power Co. The Central Co. had also transferred the hole of its works at Grove Road, together with its main nsmission lines, to the Power Co., for which payment had en made. The result had been that the Central Co. was le to capitalise a sum of £225,000, which had been divided ually between the St. James' and Westminster Companies. is had been brought into their free reserves and formed rt of the £503,746 which was capitalised by the company t year. They had also repaid the loans to the two parent mpanies. The balance of profit for the year was £137,077, hich was sufficient to pay the preference dividend and the linary dividend at the standard rates, leaving a balance of ,502 to be carried forward. At the moment they could t say whether any or all of this sum was available for tribution to the shareholders. Owing to the restrictions hich were in force during the general strike their output s sensibly reduced, but, nevertheless, last year it was over 00,000 kWh in excess of the previous year.

Underground Electric Railways of London, Ltd.

The annual meeting took place on March 15th, Lord Ashfield hairman and managing director) presiding. The chairman, moving the adoption of the report and accounts, first dealt h the associated companies whose accounts and meetings ve already been reported in previous issues. He made par- ular mention of the improved position of the Associated uipment Co., which had paid a dividend of 8 per cent., free tax; and to the North Metropolitan Electric Power Supply , from which a dividend of 10 per cent. had been received. e 'bus undertaking had maintained its position, but the ditions under which the tramways operated remained bad. accordance with his usual custom, Lord Ashfield then ceeded to review the whole question of London's traffic. reiterated the need for co-ordination of the various ser- es, and expressed the inability of the railway companies extend their systems further until more equitable treat- nt was accorded them. Further underground railways e urgently needed. Underground railways by themselves ld not be made to pay; they could only pay as integral ts of a complete system. In conclusion, the chairman rred to the income bonds, which were a burden on the pany's finances, and said that in any future scheme for raising of capital particular attention would be given to matter.

Charing Cross Electricity Supply Co., Ltd.

he report for the year ended December 31st last shows t the gross earnings of the West End Undertakings were 3,241, and there was a total available of £142,162. Interest debenture stock and sinking fund contributions absorb ,184, and the preference and standard ordinary dividends paid, leaving £468 to be carried forward. The connected on the West End mains is now 31,235 kW, of which 05 kW represents lighting.

he City Undertaking shows gross earnings of £329,911 an available balance of £212,086. Debenture and loan rest, &c., require £150,675, and after paying the preference ordinary dividends £411 is carried forward. The con- ed load is 37,587 kW, of which 13,294 kW is lighting. er the London Electricity (No. 2) Act, the Bow generating on has been leased to the London Power Co., and both West End and City undertakings now purchase electricity in bulk from that company. As a result of this, the figures for 1926 are not comparable with those of previous years. The Act provides that in 1971 the whole of the company's under- taking as existing at June 30th, 1925, shall be transferred, free of charge, to the London and Home Counties Joint Elec- tricity Authority. In accordance with that Act, a sinking fund "A" has been set up to provide for the repayment of the shareholders' capital in 1971, and a further sinking fund "B" has to be instituted to deal with capital expenditure incurred since June, 1925; any balance not so provided for will be paid by the Joint Authority upon transfer. £460,800 of the reserves has been capitalised and issued to shareholders as bonus shares; the ordinary capital now stands at £1,036,800, and the standard dividend is 1s. 7.57d. per share. A reduction in charges was made at the beginning of last year, and the consumers have benefited to the extent of over £55,000. In spite of the adverse effect of the coal dispute, the directors feel justified in paying the standard dividend, although the carry-forward is thus reduced to a nominal amount. Meet- ing: March 30th.

International Automatic Telephone Co., Ltd.

The accounts of this company were dealt with in our last issue. The report now to hand says that notwithstanding the indus- trial difficulties of the past year, the results compare favour- ably with those of 1925, and an increased return from invest- ments is reported. Following the annual meeting on April 8th, an extraordinary meeting is to be held for the purpose of considering certain proposals. One of the conditions origin- ally attached to the ordinary and preference shares was that Messrs. Theodore Gary & Co. (U.S.A.), who were responsible for securing important contracts for the company, on condi- tion that they continued to hold 10,000 deferred shares, should have the option of purchasing all or any of the preference or ordinary shares at the respective prices of 21s. 6d. and 30s. per share. The option on the ordinary shares was removed in 1925, and it is now proposed to cancel the option on the 170,338 issued preference shares. A provisional contract has been arranged with Messrs. Garv & Co. whereby they will instead have an option to subscribe for 170,338 unissued pre- ference shares and 200,000 preference shares to be created, at the price of 21s. 6d. per share. The shareholders will be asked to ratify this agreement and sanction the increasing of the preference capital from £200,000 to £400,000.

Arbroath Electric Light and Power Co., Ltd.

Mr. George Balfour, M.P. (chairman) presided at the recent annual meeting of the company, and in moving the adoption of the report (which showed a profit of £5,441) said that the local rates paid by the company for the year were equivalent to almost ½d. per kWh sold, and if the amount paid in income tax were added, the rates and taxes item was equivalent to approximately two-thirds of a penny per kWh. It was of no use talking about cheapening supplies by linking up stations when they were faced with an average of .66d. per kWh for local rates and taxes. The only heritable subjects owned by the company which should be ratable were the buildings of a ratable value of a few hundred pounds. The balance over this amount was merely a super tax on the industry which the consumer had to pay. He (the chairman) was associated with the Grampian Co., and negotiations had taken place with their directors for a bulk supply and possible transfer of the generating station to the Grampian Co., which would use it as a small subsidiary steam reserve station. The Grampian development was necessarily held in abeyance until the new legislative proposals of the Govern- ment assumed final shape.

Newcastle and District Electric Lighting Co., Ltd.

The annual meeting was held on March 17th, Colonel F. R. Simpson presiding. Moving the adoption of the report and accounts, the chairman said that a further amount of £4,360 of second debentures had been redeemed, and loans had been reduced by £2,973. During the year a large amount had been spent on cables and sub-stations for the supply of elec- tricity to new consumers. The demand continued to grow, and a considerable increase in the rate of expansion was anti- cipated. £18,000 had been provided from profits for depre- ciation, making the amount written off £206,000. Dealing with rates and taxes, he said that the steady increases in rates equalled a dividend payment of 1 per cent. on the com- pany's shares. Taking the lighting restriction due to the coal stoppage into consideration, the increase in total receipts of £1,236 might be considered satisfactory. Commenting on the new Electricity Act, he anticipated that it would be some considerable time before it caused any changes to be made in the Newcastle district.

British Electric Transformer Co., Ltd.

After meeting manufacturing costs and administrative ex- penses, the net profit for the past year is £63,202, and to it is added £8,950 brought forward, making £72,152. It is pro- posed to distribute this as follows:—To reserve, £10,000; to depreciation reserve, £5,000; preference dividend, £31,500; dividend of 5 per cent. on the ordinary shares, £16,250; carried forward, £9,402. The report records the death of Mr. George Berry, director and manager, and the appointment of Mr. F. E. Berry to the dual position. Meeting: March 29th.

Newcastle-upon-Tyne Electric Supply Co., Ltd.

The profit for the year ended December 31st last amounted to £576,421, as against £701,671 for 1925. After providing for debenture interest, &c., depreciation and contingencies reserve (£75,000), and plant renewal and improvement reserve (£25,000), and adding £41,517 brought forward, there remains £313,225. It is proposed to pay the balance of the preference dividends, and distribute 5 per cent. for the year on the ordinary shares, leaving £15,990 to be carried forward. The connections to the company's system rose from 626,689 to 657,451 h.p. The capital expenditure during the year amounted to £413,656, principally upon the high- and low-pressure distribution systems. A normal service was maintained throughout the period of the industrial disturbances, but the company's output and revenue were badly affected, while working costs were considerably increased. The company adopted the policy of using the cheapest class of English coal in preference to foreign coal of better quality at enhanced prices. Since the termination of the coal dispute the output has considerably increased as compared with the corresponding period of last year. Meeting: Newcastle, March 29th.

Llanelly and District Electric Supply Co., Ltd.

The annual meeting was held last week, Mr. A. H. Beatty, O.B.E. (chairman), presiding. In moving the adoption of the report and accounts, the chairman said that the year had started well, and had showed promise of increasing the earnings until the time of the general strike and the prolonged coal stoppage, which had resulted in an almost total cessation of work at the collieries and industrial works in South Wales for nearly nine months. Under the circumstances an account showing a trading profit of £30,548 was not an unsatisfactory result. The company's revenue was chiefly derived from electricity supply, and although the number of consumers had increased from 1,920 in 1924 to 2,730 in the year under review, the actual energy sold had decreased by over 3,000,000 kWh, as compared with the year 1924-25. On the traction side the number of passengers had decreased by over 500,000. The electricity supply business continued to show satisfactory progress, and the 5,000-kW set installed two years ago would shortly be fully loaded. Application had been made to the Electricity Commissioners for permission to install another 5,000-kW set.

St. James' and Pall Mall Electric Light Co., Ltd.

The report for 1926 shows a net profit of £75,573. An interim dividend at the rate of 10 per cent. was paid on 40,000 £5 ordinary shares, and it is now proposed to pay a final dividend of 1s. 3.3d. per share on 640,000 £1 ordinary shares, making up the standard dividend fixed in the London Electricity (No. 2) Act, 1925. A balance of £17,773 remains to be carried forward. The report records the death of Mr. Walter Leaf, the chairman of the company, and the appointment of Mr. C. P. Sparks to the board in June last. The extension of the company's tenure granted by the above-mentioned Act rendered unnecessary the retention of the sinking fund established under an agreement with the London Electric Supply Corporation, Ltd., and the fund has accordingly been divided between the companies. Meeting: April 5th.

Folkestone Electricity Supply Co., Ltd.

The accounts for the past year show a profit of £39,176, to which is added £1,499 brought forward, making £40,675. After meeting debenture interest, preference dividend, &c., it is proposed to allocate £9,013 to depreciation, £7,000 to the reserve fund, and £5,000 to the employés' superannuation fund. A final dividend of 6 per cent., free of tax (making 10 per cent. for the year, tax free) is recommended on the ordinary shares, leaving £1,498 to be carried forward. The whole of the £10,000 employés' co-partnership shares have now been allotted. It is proposed to offer to existing shareholders (at par) 40,000 new ordinary shares in the proportion of two new shares to every five at present held.

Salisbury Electric Light and Supply Co., Ltd.

The annual meeting was held on March 15th. Mr. C. J. Woodrow (chairman) presided, and presented the report for 1926, which showed a balance of £8,084. The directors recommended a final dividend of 6 per cent., free of tax, making 10 per cent. for the year. £400 was transferred to reserve, and £184 carried forward. The chairman said that the installation of the new boilers and generating plant, with the necessary buildings, had been delayed by the coal dispute, but the work was now nearing completion. Mr. F. E. Gripper had retired from the board owing to ill-health, and the vacancy had been filled by the appointment of Mr. C. H. Jones.

Oxford Electric Supply Co., Ltd.

With a balance of £2,075 brought forward, the amount available in respect of the past year is £50,120. After meeting debenture and other charges, a dividend of 7 per cent. is declared on the ordinary shares, of which 2½ per cent. has already been paid, leaving £32,289 to be carried forward. The report states that the directors have again been obliged to incur heavy capital expenditure to meet the growing demand. Negotiations are in progress with the City Council for the suspension of its purchase option for a period of 42 years from 1932. This, it is stated, would enable the company to reduce its charges and raise necessary capital for extensions. It is hoped that a satisfactory result will shortly be reached.

Clyde Valley Electrical Power Co.

The directors' report for 1926 shows a balance of prof of £226,700, to which is added £67,424 brought forwar making £294,124. After meeting the preference dividends ar transferring £90,000 to the contingency fund, it is propose to pay a final dividend of 5 per cent. on the ordinary capit (making 8 per cent. for the year) and to carry forward £50,12 The construction work at the Falls of Clyde has proceede during the year, and it is expected that the plant will l in operation in time for the winter demand. During t period the company's supply was extended to Bridge of We Carluke, Helensburgh, Kirkintilloch, Lanark, and Vale Leven. The undertaking of the Kilmalcolm Electric Lightin Co., Ltd., the share capital of which is owned by the compan has been completely reorganised. The old steam generati station has been closed down and a full supply for all purpos is being given at more favourable rates. Meeting: Glasgo March 30th.

Waygood-Otis, Ltd.

The annual meeting was held on March 16th. The cha man, Mr. Henry C. Walker, who presided, said that duri the past year several important contracts had been co pleted, notably those in connection with the Morden exte sion of the Underground Railway. The extensions and alte tions to their works were nearing completion, and they n had a factory second to none in London. He was pleas to say that, with the rare exceptions of calling upon t Otis Elevator Company, of New York, as they had power do, all their lifts were British built with British labour a materials.

Waste Heat and Gas Electrical Generating Stations, L

The report for the past year shows a net profit of £24,0 as compared with £27,019 in 1925. To this is added a amount of £14,272 brought forward, making £38,296. T directors recommend a dividend of 8 per cent. for the ye of which 1½ per cent. has already been paid, leaving a bala of £12,696 to be carried forward. The dividend for 1925 v the same. The output from the company's stations was c siderably reduced; they were closed down from May to Dece ber, but all but one are now in operation. Meeting: To (Friday).

Windsor Electrical Installation Co., Ltd.

The profit for the past year (including £5,765 brou forward) is £11,910. From this £4,000 is transferred depreciation, renewal and reserve fund. A final dividend 6 per cent. is declared (making 10 per cent. for the ye together with a bonus of 4 per cent. This leaves £6,31 be carried forward. The directors propose to capita £25,000 of the reserve and issue it to existing shareholde in the form of 7 per cent. cumulative preference shares £1 each, without payment, in the ratio of one new share each two at present held. The new shares will rank dividend as from January 1st, 1927.

Woking Electric Supply Co., Ltd.

The balance on the past year's working is £33,750, and v an amount of £1,729 brought forward there is avail £35,479. After meeting debenture interest, preference di dends, &c., £8,000 is allotted to depreciation and renew £5,000 to reserve, and £5,000 to change-over account. A di dend on the ordinary shares of 10 per cent., free of tax, i be paid, and £1,474 is carried forward. The revenue incre from £60,701 to £67,143. The death of Mr. H. W. Bow (a director) is recorded, and the report states that his son, A. H. Bowden, has been appointed to the board.

Slough and Datchet Electric Supply Co., Ltd.

The profit for 1926 (including £6,163 brought forward £20,662. This is allocated as follows:—Depreciation, ren and reserve fund, £5,500; directors' fees and tax, £1,00 final dividend of 6 per cent. (making 10 per cent. for year), together with a bonus of 4 per cent., leaving £ to be carried forward. It is proposed to increase the ca by £50,000 (to £125,000) in ordinary or preference sh During the year £17,231 was spent on capital account, chief item being mains, £11,735.

British Aluminium Co., Ltd.

The profit for the past year, including the balance bro forward, was £304,644. From this £50,000 is put to depr tion reserve, £100,000 to general reserve (making £650, and £10,000 to staff benefit fund, leaving £144,644. After ing the preference dividend and a final dividend of 6 per (making 10 per cent.), a balance of £26,567 is carried forw For 1925, in addition to the same dividend, a bonus of 2 cent. was distributed.

Ericsson Telephones, Ltd.

The report for the past year records a reduction in the profit from £66,174 to £44,599, after meeting taxation, de ture interest, depreciation, &c. A balance of £22,2 brought forward, making £66,858. It is proposed to off £6,475, stamp fees on new capital, to transfer £1 to general reserve (against £65,000), and to pay a div of 8 per cent. on the ordinary shares, leaving £22,217 carried forward. Meeting: March 30th.

British Insulated Cables, Ltd.

The annual meeting was held on March 21st, Sir Arthur Stanley, G.B.E., presiding in the absence, through ill-health, of the chairman, Mr. J. Taylor. After referring, with regret, to the death of Sir J. S. Harmood-Banner (vice-chairman), Sir Arthur said that the past year had been a good one for the company, although the profits had decreased as compared with the record attained in 1925. The investments had been increased by £129,812 to £780,165, and a recent valuation showed them to be considerably above the balance-sheet figure. Owing to the general strike, the works were closed down for nearly a fortnight, which, of course, combined with the coal dispute, had an adverse affect upon the year's trading. He hoped that henceforward harmony would exist between the company and its employés. The profit-sharing scheme which had been in operation for many years had been fully justified. The company had recently secured, in the face of keen competition, an order valued at about £700,000 for the electrical equipment (overhead system) of the main line of the Great Indian Peninsula Railway; a large contract for the equipment of the suburban lines of that railway had already been carried out. The Cable Makers' Association had secured a high grade of quality in the products of its members, and had standardised British cables. Its work had been of great value. Now a serious attempt was being made to bring certain companies, including the British Insulated, into closer contact. These companies would collaborate more completely than in the past and, although remaining autonomous, would work together in such a way as to ensure, as far as possible, a community of interests. Information would be interchanged upon the subjects of manufacturing processes and costs, the purchasing of raw materials, and research. Each company was already spending large sums upon research; co-ordination of effort would result in the saving of expense and better results. The principal object of that closer association was the lowering of costs in order to meet foreign competition at home and abroad which had recently increased to a large extent. If the negotiations were successful the result would be of benefit not only to the shareholders of the companies, but also to the buyers and users of electric cables; in addition, an increased export trade would mean more employment. The chairman then reviewed the year's accounts, which were dealt with in our issue of March 18th (p. 444), and dealt with the company's investments. Those investments, he said, had been made primarily in the trading interests of the company, and they had been amply justified. British Government and other securities had increased by over £120,000. The Midland Electric Corporation, in which a considerable interest was held, had paid a dividend and bonus of 15 per cent. for 1925, and the same rate was again recommended. The concessions of the Electric Supply Co. of Victoria expired in about four years' time, but negotiations were in hand with the authorities for their extension. The report and accounts were adopted.

Pinchin, Johnson & Co., Ltd.

Speaking at the annual meeting last week, the chairman (Mr. E. Robson) said that the paying of a 30 per cent. dividend during a troubled year was a matter for congratulation. The company was in a strong position, and its strength had enabled it to recover very rapidly from the effects of the general strike. Its success was due to a combination of up-to-date plant, technical skill, and efficient marketing. The directors were asking for authority to create 300,000 new ordinary shares; 240,000 of those were required in connection with the acquisition of the business of Messrs. Docker Bros. The report and accounts were adopted, and subsequently the increasing of the capital was approved.

Yorkshire (West Riding) Electric Tramways Co., Ltd.

The coal dispute had a serious effect upon the company's business, the net income falling from £39,955 in 1925 to £28,875 last year. Adding £574 brought forward, the available balance is £29,449. After paying the preference dividend and reserving £11,103 for renewals, &c., a balance of £4,166 is carried forward. A dividend of 5 per cent. was paid on the ordinary shares for the preceding year.

English Electric Co., Ltd.

There was a deficit of £78,590 for 1926 after crediting £74,098 brought forward. The directors are accordingly unable to pay the balance of the preference dividend. The prospects for the current year are stated to be better, the unexecuted orders brought forward being much in excess of those brought forward from 1925. Meeting: March 30th.

Stock Exchange Notice.

Application has been made to the Committee to allow the following to be officially quoted:—

North Metropolitan Power Station Co., Ltd.—£850,000 5 per cent. guaranteed debenture stock, 1957, and partly-paid scrip.

Tyneside Electrical Development Co., Ltd.

The profit for the past year amounted to £4,064, and to it is added £744 brought forward, making £4,808. It is proposed to pay a dividend of 10 per cent. on the deferred ordinary shares (against 6 per cent. for 1925); to transfer £500 to general reserve; and carry forward £809.

Chelsea Electricity Supply Co., Ltd.

A final dividend of £6 1s. 3d. per cent. has been declared on the ordinary shares (1s. 2.55d. per share). This with the interim dividend of 4½ per cent., makes up the standard rate for the year.

Brompton and Kensington Electricity Supply Co., Ltd.

It is proposed to pay a final ordinary dividend of 10.7d. per share; this, with interim distribution of 5 per cent., makes up the standard dividend for the year.

Eastern Extension, Australasia and China Telegraph Co., Ltd.

The directors have declared a final dividend of 5s. per share, free of tax.

Eastern Telegraph Co., Ltd.

The directors have declared a final dividend of 2½ per cent., free of tax, on the ordinary stock, making 10 per cent. for the year, as in 1925.

Rangoon Electric Tramway and Supply Co., Ltd.

A final dividend of 1 rupee 4 annas per share is recommended on the old ordinary shares, and a dividend of 14 annas per share on the new shares.

Thos. W. Ward, Ltd.

An interim ordinary dividend of 2½ per cent., free of tax (as in 1926), has been declared.

Kensington and Knightsbridge Electric Lighting Co., Ltd.

The directors recommend a balance dividend of 1s. 3d. per share on the ordinary shares.

Anglo-Portuguese Telephone Co., Ltd.

A final dividend of 4 per cent. is recommended, making 7 per cent. for the year.

Mid-Cheshire Electricity Supply Co., Ltd.

A dividend of 3½ per cent. has been declared on the ordinary shares out of a net profit of £7,436.

Metropolitan-Vickers Electrical Co., Ltd.

The directors have again declared a dividend of 8 per cent. upon the ordinary shares.

Alley & McLellan, Ltd.

The directors are unable to declare a dividend on the ordinary shares for the past year.

Stocks and Shares.

Monday Evening.

The Stock Exchange financial year ends with March 25th, and it cannot be said that the House is concluding its fiscal twelvemonth in a particularly happy frame of mind. There seems to be a lot of stock about for which a permanent home is wanted, its present holders not being sufficiently ready, or strong enough, to keep it. Nevertheless, the purely investment markets are tolerably firm. The industrial sections are held back by uncertainties as to what may be proposed in the Budget. The news from China is a depressing factor. The Balkans appear to be getting busy again.

The Marconi meeting is now ancient history. The decisive majority given to the directors by the shareholders in support of the board's scheme is evidence of a desire to let the dead past bury its dead and to allow the company to go ahead under reorganised conditions of capital such as will bring within sight the early payment of a dividend. Now that the heat, the dust, and the acrimony have died away, the company can settle down to business. Expectation canvasses the possibility of a 10 per cent. dividend on the 10s. shares, to be declared, it may be, within the next few months. If it be complained that a 10 per cent. dividend would give a very modest yield on the present price of 17s. 6d., namely, 5¾ per cent., the answer is that this rate ought to be increased as the company gets fairly into its stride.

The Metropolitan Electric Supply Company provided a pleasant surprise by declaring a final dividend at the rate of 12 per cent., on the whole of the ordinary share capital, making 8 per cent. for the year. This is equal to 12 per cent. on the old capital, an increase of 1 per cent. over the 1925 dividend. The market had not expected any change, and the price of "Mets." rose 2s. to 27s. Like the County of London Electric Supply Company, the Metropolitan has a wider area than that over which the other London undertakings work, and this consideration is regarded as justifying a hope of higher dividends, after 1931, than the 7 per cent. standard rate laid down in the Act.

London Electrics have improved to 24s. 6d. on announcement of a final dividend, which makes £8 8s. 7d. per cent. for 1926 on the present ordinary share capital. Last year the dividend was 10 per cent. on the smaller capital. Prices of other shares in the London group are firm. Kensingtons have strengthened to 25s. 6d.

The provincial electric supply shares are hard, on the atten-

tion being paid to them as offering more scope than the London list does. Had it not been for the effects of the coal stoppage, the companies would undoubtedly have done very well in 1926. As it is, the general result must be accounted good in the circumstances. The Clyde Valley pays 5 per cent. final, making 8 per cent. for the year, the same as before: the profits are, naturally, lower. Midland Counties are mounting quietly, and have more than recovered the dividend taken off the price a fortnight ago. Lancashire Electrics advanced to 25s. 6d. Folkestone Electrics at 43s. 9d. are nearly ⅛ up.

The Yorkshire (West Riding) Electric Tramways, as already announced, has passed its dividend for 1926, against 5 per cent. paid for 1925. The report points out that the company operates in the heart of the West Yorkshire coalfield, and, consequently, the full effect of the miners' strike was experienced. The shares are quoted at about 8s. 9d. On the other hand, Yorkshire Electric Power are a good market at 29s. 6d.

Tube stocks yielded part of their recent strength, because Lord Ashfield's speech at the meeting of the Underground Electric Railways of London was less definite than had been expected on the subject of traffic restriction. It would appear as though a good deal of work has yet to be done before anything like a cut-and-dried scheme can be formulated in regard to the division of competition. His Lordship dealt with the efforts that the Board is making for repayment of the 6 per cent. tax free income bonds. If these could be extinguished, by redemption, and replaced by some less expensive form of security, the £1 ordinary shares would stand a better chance, and it is this factor that maintains the shares at their present price. There are very few dividend-paying shares which offer so low a current yield as £1 18s. 9d. per cent. on the money. The reduction in the price of petrol is expected to benefit the company to some extent.

Reference was made last week to the dividends of 10 per cent. declared upon Automatic Telephones, and International Automatic Telephone ordinary and deferred. Hopefulness has looked for more, in the case of the last two, but prices are maintained. Internationals being 43s. and 41s. 3d. for the ordinary and deferred respectively. The company's report shows an advanced profit, though the improvement is less sensational than that of a year ago. The American house which held the controlling interest, Messrs. Theodore Gary & Co., have offered to cancel their original option to buy 170,000 International Telephone preference at 21s. 6d., exchanging for this the right to subscribe, also at 21s. 6d., for an equal number of new preference shares to be created for that purpose.

Telephone Manufacturing shares are dull, and the price has sagged to 6s. 9d. There seems to be no resistance offered to a long stream of small sellers. The American Telephone and Telegraph Company publishes a remarkable report showing net earnings for last year of 137 million dollars, out of which dividends totalling 86½ million dollars have been paid. The company had, at the end of last year, 399,121 stockholders, the average holding of whom was 26½ shares. Its capital is 1,077 million dollars; it owns 17½ million telephones. A touch of human interest is added to the report by the statement that although the telephone is one of the greatest inventions of the age, the inventor, and the original backers, never made a great fortune from it. There have not been many telephone fortunes, the directors remark, though they might have added that shareholders in their own company have done extremely well out of original investment in its stock.

British Aluminium have had rather a sharp drop, to 45s., upon the dividend announcement, making 10 per cent., against 12½ per cent. a year ago. Of the latter, 2½ per cent. was declared specifically as bonus, but the price had been raised to a level at which 10 per cent. offers a very meagre return, and it promptly shed half a crown. English Electrics fell further, to 10s. 6d. General Electrics shed the ninepence they gained last week. Siemens have fallen 1/16 to 27s. 6d.

Declines are marked against Enfield ordinary at 3¾, Metropolitan-Vickers, Johnson & Phillips, and British Thomson-Houston preference at 22s. 3d. British Electric Transformer preference rose to 18s. 9d. on the report. All the arrears are now cleared off, and a 5 per cent. payment on the ordinary shares is declared. The company made a net profit last year of £63,200 on its issued share capital of £625,000, of which £300,000 is in preference and £325,000 in ordinary shares, all of £1 each.

The Newcastle-on-Tyne Electric Supply Company was expected to do poorly in 1926, and the reduction of the dividend to 5 per cent., after 7 per cent. in 1925, has aroused no surprise. The profits are substantially down, but the report is not at all a bad one, and the drop in profits should prove to be no more than temporary. Ericsson Telephones pays 8 per cent. on the ordinary, the profits being a good deal lower than those of 1925. In the foreign tramways group, Brazilian Tractions have gone back 3½ after their pyrotechnical jump. Mexican Utilities are mostly higher, and the market in them continues very hard. British Columbia Electric Railway stocks have further rallied. Rumours that are as yet too irresponsible for repetition serve to keep up the prices of Anglo-Argentine Tramways. The company's traffics are fair, and nothing has been heard of late concerning the threatened opposition from a "Tube" in Buenos Ayres. These two factors may have encouraged the support that has raised both preference issues to 3¼.

Babcocks at 52s. 6d. have not changed, but iron and steel shares are lower as a whole. The rubber market is tame and rather uninteresting; the produce is steady: business in the share market has become quiescent.

Our Foreign Electrical Trade.

Electrical Exports and Imports during February, 1927.

IN studying the foreign trade figures for February and noting decreases in both exports and imports, it should be remembered that the month was three days shorter than its predecessor which, naturally, makes an appreciable difference. Moreover, in the case of the exports, the influence of the submarine cable item once again made itself felt by falling to the extent of £179,000—more than accounting for the fall in the total. The other items in the export list, as a whole, showed a rise of about £16,000, increases and decreases being about equal in number. There was a net fall of £11,000 in the machinery class, although unenumerated machinery showed the largest increase. Comparison with the February, 1926, figures shows that, in spite of the equal length of the months and the fact that submarine cable exports were higher, the total fell by over £31,000. Four items show substantial decreases, *viz.*, insulated wires and cables, "other" motors and generators, non-submarine telegraph wires and cables, and telegraph and telephone apparatus. Against these are set large rises in unenumerated goods and apparatus, unenumerated machinery and submarine cables. The exports for the first two months of the year still make a good showing in comparison with the corresponding period of 1926.

The proportional decrease in imports was greater than the fall in exports, and there was actually only one increase as compared with January—in arc lamps and parts. The two unenumerated classes showed very large declines, amounting to about 25 per cent. in each case. On the other hand, compared with February, 1926, increases were general, there being only two decreases. The result was a rise of nearly £56,000 in the total.

The re-exports, which have shown a falling tendency for a few months, revived a little and were higher than in the preceding month and February, 1926.

The following table shows the distribution of our electrical machinery exports last month and in February, 1926:—

Destination.	Feb., 1926. £	Feb., 1927. £	Inc. or dec. £
